Ashtabula, Ohio—The Pennsylvania R.R. Co. now has stored in its yards at the north end of the city at least 30,000 tons of coal which are awaiting shipment to Canada as soon as navigation is open. The Pennsylvania yards are now operating on a 4 yard engine basis, and it is probable that the number of these engines will be increased within the next few weeks or as soon as Lake transportation opens sufficiently.

Pittsburgh, Penn.—A permanent injunction was refused by Judge Thomson of the District Court of the United States for the Western District of Pennsylvania on Apr. 4, and the preliminary injunction dissolved, restraining John H. Jones, one of the receivers, from taking an appeal against the final decree previously handed down by Judge Ford in foreclosure proceedings by the Union Trust Co. against the Pittsburgh-Buffalo Co., and an appeal was taken.

Lewes, Del.—It is believed that the crews of the Consolidation Coal Co.'s barges Nos. 6 and 9, bound from Baltimore to Boston with coal, were drowned when their craft foundered near Cape Henlopen and went to pieces in the gale of Apr. 3. These barges were in tow of the tug "Cumberland" and broke adrift early in the day. Despite great efforts the Cumberland's crew was unable to get another line to the barges which drifted for some time, finally going aground, where they broke to pieces and sank with all on board.

St. Louis, Mo.—The new $50,000,000 barge-loading and unloading trestle on the east side of the Mississippi River, opposite Utah St., owned by the Alton & Southern R.R., was opened for business the past week. Several cars of coal can be handled at one time, it being the intention to ship coal south and bring back other cargoes. This coal will come chiefly from the Belleville District on connections of the Alton & Southern. This is the largest barge-loading device on the Mississippi River, with the exception of those at the extreme southern end.

Pottsville, Penn.—The Supreme Court recently upheld the Schuylkill County Court in refusing to interfere with the mine inspectors' examining board on charges that it refused a certificate to Thomas Reese, although the records showed that he had answered correctly 90 per cent. of the questions asked him. It was held that the Board of Examiners is not only entitled to but is required to exercise sound discretion in issuing inspectors' certificates. It was pointed out that the powers of the mine inspector are great, his responsibilities enormous, and both lives and property were trusted to his keeping. Therefore, under the act creating the Board of Mine Examiners the duty of that body was judicial and not ministerial alone. The Board is, therefore, justified in using its discretion in the awarding of certificates to inspectors. There were no allegations of fraud or conspiracy on the part of the members of the Board to deprive the plaintiff of his rights.

Coal Trade Reviews

General Review

Heavy movement of anthracite but the outlook is not encouraging. Bituminous slightly firmer, though purchasers predict a further recession. Some large contracts still open. No improvements in the prospects for the Lake trade.

The cold weather and storms that marked the beginning of the month served to stimulate activity in the anthracite trade for the time being although it is clear that the pace is slowing down. The industrial depression is causing consumers to hesitate about investing heavily in stocks, and the effects of this are reflected back through the dealer, wholesaler, and up to the operator. Orders are dispatched with greater promptness than is ordinarily obtainable during the lowest price period of the year. Indications point to a dull summer succeeded by an exceedingly active fall trade.

The more conservative of the bituminous interests are becoming unusually cautious about committing themselves on long-term contracts, and the month of April is progressing somewhat better than was anticipated. The tonnage for April is running slightly ahead of the March movement which is a rather unusual condition. On the other hand there are still some large contracts to be closed, and these buyers are expressing every confidence in a general break in the market later. It is also a fact that a number of shipments are being either postponed or canceled on current business, and this extra pressure has developed a receding tendency in prices. The export and bunkering tonnage keep up in excellent shape and it is becoming evident that certain interests are making preparations to place large tonnages permanently in the foreign markets.

It is estimated that less than half the normal amount of contract business in the Pittsburgh district has been closed to date, even with the additional inducement of low prices. There has been a slight increase in the demand on current business, but it is still insufficient to absorb the production with the result that there is considerable free coal on the market. Canadian business is especially light. There has scarcely been any negotiations at all on Lake contracts, and it is evident that the opening will be late and the early movement light. The situation is generally indeterminate although rather mixed.

Much the same conditions prevail in Ohio. There has been some stir in railroad contracts but steam users generally are exceedingly backward about accumulating any stocks and generally content to confine their purchases to the open market, for the time being at least. The colder weather toned up the Middlewestern market on certain grades, but caused no decisive change. The retailers have generally experienced a satisfactory winter, due to the low prices prevailing in the wholesale circles, and also to the reduced cost of labor, and easy deliveries as a result of the mild weather.

BUSINESS OPINIONS

Bradstreet's—Progress in distributive trade, notwithstanding the existence of some retarding factors, speedier operations in industrial lines, large foreign buying of steel, relatively heavy trading in stocks, remarkably heavy exports of wheat, good wheat crop advices, and evidences of a disposition to embark in new enterprises, are the preëminent factors in this week's news.

Dun's Review—Domestic trade gains slowly, but war orders and food exports continue very heavy and in all branches of business, and in all sections there is a distinct growth of confidence.

The Financial Chronicle—There is substantial reason for the more confident tone that is gradually spreading through trade and financial circles, even though the end of the European war does not yet appear to be in sight.

Boston News Bureau—There is no doubt but that every day sees a greater degree of confidence the country over. Improvement in general domestic trade is slow, but unless every sign fails, it will be a feature before many months have passed. People are still extremely cautious, which of course strengthens the situation. The grain and cotton markets continue strong and active.

American Wool and Cotton Reporter—The wool market continues quiet, although a large supply of South American and Australian wools arrived during the week. Less business is being transacted than a few weeks ago but prices remain firm.

Engineering News—Returns from building inspectors in 21 cities of the Eastern States show an increase in the contemplated building operations in March of this year compared with the same month last year. While the gain is small the progressive improvement which has continued since the first of the year is highly satisfactory. In the same cities the three months' building operations show a gain of $7,000,000.

The Iron and Steel Industry—Operating to about 70% of capacity, the steel mills are in much better shape regarding orders than on Jan. 1. Recent business has been well above that booked in the first quarter of the year, and while it is estimated that 600,000 tons of pig iron were sold in March, the total sales from merchant furnaces for the first quarter aggregate only 1,000,000 tons. The Steel Corporation is operating at 72% of capacity, and some of the smaller independents are running nearly full. The pig iron movement has eased off slightly in the last ten days, but stocks have been greatly reduced. It is probable that Northern furnaces have 60,000 tons less unsold iron than at the beginning of the year, and the heavy stocks held by Alabama furnaces have been materially reduced. Locomotive works and car builders have both profited by large orders from foreign governments for munitions of war.

ATLANTIC SEABOARD

BOSTON

Slightly firmer attitude toward long-term contracts the only new feature. Pocahontas and New River shippers continue to close small contracts at 1914 basis or less. Georges Creek in excessive supply. Disastrous gale. Anthracite movement seasonable.

Bituminous—While no improvement can be reported in the spot situation the week has developed a somewhat more cautious attitude on the part of Hampton Roads shippers with regard to long-term contracts. Opportunities to name prices for two and three years have been passed over and even on yearly contracts that involve large tonnages there is a disposition to adhere more closely to a remunerative price than has been the case for several weeks. Buyers, on the other hand, are simply waiting for what they call the "inevitable break" later on. In other words, some of the large contracts still open will not be closed until buyers secure the low offerings they count on. Contracts for smaller tonnages continue to be made on last year's figures, or less.

Meanwhile, trade is still very slack. There is no spot business worth mentioning and contractors are inclined to postpone shipments on account of the large stocks. Even cancellations have been made of shipments en route and this has thrown an extra supply on the market inland and prices have receded under the pressure.

There has been little change in Georges Creek. Arrivals here are still in excess of demand and are likely to continue so until output is materially curtailed.

The choicer grades from the Pennsylvania districts are actively competing against Pocahontas and New River and here and there instances are heard of their securing contracts as a result of favorable tests. Buyers are learning to discriminate and there are several good Cambria and Somerset coals that are apparently in this market to stay.

Water Freights show no change. Shippers who have barge transportation of their own are chartering now and then on the open market and there is more than a sufficient supply for all current needs.

The storm of Saturday last took heavy toll of the coal fleet. The Philadelphia & Reading Transportation Line lost three light barges off Cape Cod, and the Consolidation Coal Co. two barges with their crews near Cape Henlopen. The schooner "M. D. Cross" is also reported a total loss near Diamond Shoal.

Anthracite—Ample supplies of all sizes at the loading piers assure prompt dispatch to barges as fast as they report and March and April together will probably be a record period for receipts at this end. Dealers are disposed to take on all they can store but when that point is reached it is realized there will be a long dull season. An unusual number of cargoes sent forward by individual shippers are on the market here. No marked concession in price, however, has so far been heard.

Current quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.90@1.40	$1.15@1.60	$1.67@1.77	
Philadelphia*	2.15@2.65	2.40@2.85	2.92@3.02	
New York*	2.45@2.95	2.70@3.15	3.22@3.32	
Baltimore*	....	....	2.85@2.95	
Hampton Roads*	....	....	....	$2.50@2.75
Boston†	....	....	....	3.60@3.73
Providence†	....	....	....	3.50@3.78

* F.o.b. †On cars.

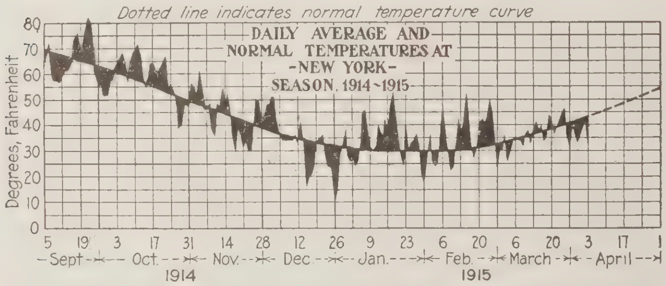
NEW YORK

Current bituminous business quiet but there are indications of an improvement. Anthracite shows signs of slowing down. Light output for this month.

Bituminous—April business shows indications of being better than during March, which is encouraging in view of the fact that the current month is ordinarily one of the dullest of the year. Coal is being rather closely held at the mines, and the supplies at Tidewater are reduced to a point where a temporary shortage occasionally develops. This has had a tendency to stiffen up prices in the spot market, $2.25 being the very best that can be done at the moment on western Maryland as compared with some forced sales of Clearfield coal on demurrage at $2.05 several weeks ago.

The general market continues relatively dull with no indications of any change in sight, although it is not at all likely that the situation through the summer will be any worse than during the past winter. The current month has undoubtedly started off notably better than is ordinarily the case. Bunkering trade is fairly lively. There are reports to the effect that the Berwind-White Co. is assuming a more aggressive attitude; it is commonly understood that they are pounding prices severely on best Miller grades in order to move tonnage and it is also stated that their mines had a full week operations of seven days on special off-shore business that suddenly developed several weeks ago.

Prices on the better grades are somewhat easier, the market now being quotable on the following basis: West Virginia steam, $2.35@2.55; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.05@3.10; Georges Creek, $3.15.



Anthracite—The unexpected cool weather that marked the opening days of the new coal year, proved an additional inducement to buyers and the April business has opened up actively. The demand is generally strong in all directions but close observers believe that the pace cannot be maintained throughout the month. The unsatisfactory conditions in financial circles is either preventing the consumer from stocking at all or making a substantial reduction in his tonnage; this is naturally reflected in the wholesaler's business and so on back to the operator. The indications now are for a rather slack, if not notably dull summer, succeeded by an extremely active fall market, when the situation may even become acute, should there be much severe weather.

The demand so far seems to be about equally distributed among all grades. The individuals are cutting prices on the steam coals, with the result that the companies are finding these sizes exceedingly difficult to move, and considerable is accumulating at some points. Large distributors are showing some anxiety over shipments for the month, which will undoubtedly be very light, because of the numerous holidays. Practically all the mines shut down on Apr. 1, and were closed until the morning of Apr. 6. Eliminating the Sundays in the month and one or two additional holidays, it has been estimated that the mines will only work 20 full days during the month. With a normal April demand it is doubtful if the requirements could be satisfied on such a curtailed schedule.

The anthracite market is now quotable on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$4.60	$4.60	$4.55	$4.55
Egg	4.85	4.85	4.80	4.80
Stove	4.85	4.85	4.80	4.80
Chestnut	5.10	5.10	5.05	5.05
Pea	3.55	3.35@3.55	3.50	3.15@3.50
Buckwheat	2.80	2.60@2.80	2.50@2.75	2.35@2.75
Rice	2.30	2.30@2.40	2.00@2.25	2.10@2.35
Barley	1.80	1.60@1.80	1.75	1.40@1.75

BALTIMORE

Storm caused delays and the sinking of coal laden vessels. Bituminous market flat. Exports continue large.

The heavy storm caused much trouble in the coal trade. Shipments by water were delayed, two coal barges owned by the Consolidation Coal Co. went down off the Chesapeake Capes with their crew of ten, communication by telegraph and telephone out of Baltimore was badly crippled, and delivery work Saturday was stopped. All the South and many parts of West Virginia and western Maryland were cut off from wire communication over Saturday and Sunday.

Bituminous conditions remain flat. Low grade Pennsylvania coals were offering around 85 to 95c., and the poorer grades from West Virginia and western Maryland were offering at from 75 to 85c. in many cases. Fair to best coals in all regions were freely offered at $1.10 to $1.25, with but few takers. Contracting continues the main feature of the trade; most of the mining centers are apparently anxious to get a larger tonnage covered.

Export business continues good. During March a total of 76,888 tons was exported, according to government figures. This makes a total of nearly a quarter of a million tons for the first quarter of the year.

The following coal charters were announced here the past week:

Vessel	Nationality	To	Rate
Vancouver	British	River Plate	$9.48
Ruth E. Cobb		Kingston, Jamaica	
Breynton	British	La Plata	9.60
Farringford		Buenos Aires	
Modiva		Guantanamo	
Sowell	British	West Coast Italy	12.00
Rothley	British	Bordeaux	13.80
Camilla	Norwegian	Bocas del Toro	
Josey	Danish	Port Limon	
Astoria	British	Augusta, Sicily	
Competitor	British	River Plate	

Note—Steamers are indicated by **bold face type**, all others being schooners.

PHILADELPHIA

Anthracite continues on about the same basis as last week. Domestic sizes well taken care of but steam grades are inclined to drag. Bituminous trade listless, with occasional favorable reports.

Anthracite—After almost a week of holidays, mining operations were resumed the early part of the week, and will doubtless continue on full time for the balance of the month, providing the market will absorb the steam sizes. The lack of facilities to store these small sizes may compel some of the companies to curtail operations as it is understood that they are pretty well filled up, though at the present time, the market is absorbing the output.

It is understood the dealers are placing comparatively few orders for April shipment, stating that they do not expect a heavy demand. They also state they are receiving offers from some of the operators to protect them at the April price until September, and in some cases later. The price of pea coal has been further reduced on a slow market; it is being freely offered at $2, and while there may be some sales at $2.25, this is undoubtedly on contracts. Broken size, on full mining, seems to be easier. Egg is short of the market requirements; the opening month of the new coal season invariably finds a shortage in this size, and this year is no exception. Stove is also well taken care of, as well as chestnut.

The Tidewater business to New England continues heavy, barges being loaded as fast as they are returned. Lack of egg coal is seriously handicapping the prompt loading of barges, in some instances, although, as a general rule, there is little or no delay.

Prices at Tidewater rule about as follows:

	Circular	Individuals
Broken	$4.25	$4.25
Egg	4.50	4.50
Stove	4.50	4.50@4.60
Nut	4.75	4.60@4.75

HAMPTON ROADS

Shipments for the week heavy. Demand increasing. March tonnage reaches a total of 1,073,227 tons.

Dumpings at all piers during the week have been heavy. Large shipments have gone coastwise to New England ports and the export movement also shows up well. One cargo has been loaded by the Government for San Francisco, amounting to about 6600 tons. The demand seems to be improving for both coastwise and export shipments and while a large percentage of the movement is on contract, a few large spot sales are being made. The largest export shipment was loaded into the steamer "Cristobal" for the Canal Zone and amounted to about 10,000 tons.

As was expected the dumpings for the month of March ran considerably in excess of the February figures, totaling 1,073,223 tons. The Norfolk & Western Ry. from Lamberts Point dumped 516,141 tons, the Chesapeake & Ohio Ry. at Newport News came second with 315,799 tons and the Virginian Ry. from Sewalls Point dumped 241,287 tons. The Norfolk & Western Ry. dumped as much as the Chesapeake & Ohio and Virginian combined.

Vessels clearing from Hampton Roads during the week of March 26 to April 2, 1915, were:

Norfolk			Newport News		
Vessel	Tons	Destination	Vessel	Tons	Destination
Juno	3,000	Barbados	**Harald**	4500	Bridgetown
Vesuvio	6,000	Italy	**Stromboli**	7000	Naples
Huayna	1,848	Para	**Albergen**	2767	Port Au Spain
Salaminia	3,988	Buenos Aires	**Newton**	7250	Cuba
Buckhausen	2,200	Port Au Spain	**Iolo**	5000	Rio De Janeiro
Cristobal	10,000	Canal Zone			
Maude Palmer	2,457	Para			
Tyskland	2,330	St. Georges			
R. P. Pendleton	1,478	St. Michaels			

Note—Steamers are indicated by **bold face type**, all others being schooners.

OCEAN FREIGHTS

Business quiet over Easter holidays. Market erratic and uncertain.

The Easter holidays have interfered very materially with business.

Early in the week we chartered a number of steamers for export coals, principally to South America, some at $9.36 to the Plate, and since then a large British boat has been closed by others for a similar voyage at $9.48 although it was thought that this market would decline rather than advance, as a number of steamers were offering for such business.

To	Rate	To	Rate
Havana	**$2 75**	Guantanamo	$3.25@3.75
Cardenas or Sagua	2.50@2.75	Demerara	5.50@6.00
Cienfuegos	**3 00**	Bermuda	3.50@4.00
Port au Spain, Trinidad	**3 75**	Vera Cruz	**3 50**
St. Lucia	3.50@3.75	Tampico	**3 50**
St. Thomas	**3 25**	Rio	**10 20**

Kingston	3.00@3.25	Mediterranean*	**10 80**
Curacao	3.50@3.75	Valparaiso†	8.40@9.60
Santiago	3.25@3.75		

Note—Rates noted in **bold face** type are only approximate.
* To a direct port not east of the West coast of Italy, Spain, excluded.
† With 800 tons per day discharge.
W. W. Battie & Co.'s Coal Trade Freight Report.

OCEAN CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Farnham	British	Virginia	Lower River Plate	1934	$9.36 9.60
Farringford	British	Baltimore	Buenos Aires	1995	
Stanley Dollar		Baltimore	Seattle	955	
Modiva	Norwegian	Baltimore	Guantanamo	778	
Astoria	British	Baltimore	Augusta, Sicily	2743	
Sif	Norwegian	Newport News	Fort de France, Martinique	1959	
Josey	Danish	Baltimore	Port Limon	1671	
Mary L. Baxter		Norfolk	Portland	826	
Competitor	British	Atlantic Range	River Plate	2216	
Lewiston		Norfolk	Manaos, Brazil	711	
Ellen Little		Norfolk	Para	807	
Barbara		Norfolk	Bermuda	746	
Ella L. Davenport		Philadelphia	Cardenas	470	

Note—Steamers are indicated by **bold face type**, all others being schooners.

LAKE MARKETS

PITTSBURGH

Demand scarcely increased, and much free coal depressing market. Contracting has been very light. Lake business still in abeyance.

There has been a slight increase in manufacturing demand, but domestic demand has decreased further and railroad consumption has experienced scarcely any increase. On the whole the demand is quite insufficient to absorb the present production, and there remains much free coal, which is going at all sorts of prices according to the exigencies of individual cases, $1 for mine-run not being minimum in isolated cases.

Contracting for the twelvemonth is also unsatisfactory. By this date nearly all the regular contracts should be closed, yet it is doubtful whether one-half the expiring contracts have been signed up again. Many buyers seem to have concluded that as long as free coal can be purchased at considerably lower prices than can be done on contracts it is no time to enter into contracts. The fact that contract prices are about 15c. lower than prevailed a year ago does not seem to be sufficient to bring them in line.

Prospects for the Lake trade continue poor. No contracts are reported as yet, except in isolated instances, and it certainly cannot be said that buying for the Lake trade has commenced. The opening of shipments will be unusually late, and the early movement will be confined to coal produced by the shippers or due on long-term contracts. Contracts for the twelvemonth are supposed to be on the basis of about $1.15 for mine-run, but the figure seems to have been shaded more often than not in contracts made thus far.

For free coal the regular asking prices, frequently shaded, can be quoted the same as in last report: Slack, 90c.@$1; nut and slack, 95c.@$1.05; nut, $1.05@1.10; mine-run, $1.05@1.10; ¾-in., $1.15; 1¼-in., $1.25, per net ton at mine.

BUFFALO

Continued dullness in bituminous trade. Prices show the effect of much competition. Contracts closed at low figures. Anthracite trade has good April orders; movement by Lake will be delayed.

Bituminous—General dullness still prevails in the Buffalo market due largely to the lack of Canadian orders, though Seaboard conditions are also depressed. Business is just about the same as a month ago and very few lines are working at anywhere near normal. The lack of orders is depressing prices and spot shipments are being picked up at figures that show little profit. Operators are continuing their plan of keeping down the output. Contracts are few and show up rather poorly as compared with last year's prices, being quite often 5 to 10c. lower and even occasionally 15 cents.

The opening up of the Lake trade in bituminous may relieve the situation to some extent and cause a resumption of activity, but the outlook is as yet uncertain. There is no demand for early Lake shipments, as a good deal of coal was carried over from last season.

Prices are unchanged and weak at $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack, with Allegheny Valley grades about 25c. lower than Pittsburgh.

Anthracite—The amount of April business is less than normal, though one or two companies report that their trade is holding its own as compared with last year. Dealers have been finding their collections running behind and are forced to buy less than usual. The Lake movement of anthracite may not start until about May 1. Ice conditions remain unsuitable for sailing and the weather has been too cool to allow any breaking up of the ice fields, which extend as far west as Toledo. About 30 cargoes are now afloat here.

COLUMBUS

Trade is still dull. Lake prospects are not good. Production heavily restricted.

The market has continued inactive. On the whole it is in bad shape and immediate hopes for improvement are not bright. Prices are still low, although the new Apr. 1 circulars are no lower than current quotations.

The chief activity of the market has been trading in West Virginia fine coal. With the more general use of mechanical stokers and the curtailed production of lump in Ohio, users of the small sizes have been compelled to look to West Virginia for their supply of fuel. As a result prices on these grades are still strong, ranging from 65 to 75c. and in some instances even higher.

Domestic lump is selling only in small orders. Dealers' stocks are apparently sufficient for the future and they are not ordering in any large quantities as they do not wish to carry over any surplus. Retail prices are still at the winter levels, though a reduction is usually made Apr. 1; dealers believed that it would not stimulate the market to make reductions and consequently they are charging the same prices as formerly.

Steam business is quiet in all directions. Some activity has developed in renewing railroad contracts and sales managers have been working along that line. Steam users are not buying any great tonnage, being loath to accumulate stocks. Many of the manufacturers are content to buy in the open market instead of entering into contracts.

Production has been at a low point all week. In most districts it is estimated at 25% of normal; in the Pomeroy Bend it has been about one-third of the average.

Uncertainty still prevails in the Lake trade. It is believed that fully 5,000,000 tons of coal have been carried over on the docks of the Northwest and this means a late opening. Practically no bottoms have been chartered as yet because of the uncertainty.

Prices in the Ohio field are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.45	$1.50	...
Inch and a quarter	1.30	1.35	$1.30
Three-quarter inch	1.25	1.30	1.25
Nut	1.15	1.25	1.15
Mine-run	1.05	1.10	1.05
Nut, pea and slack	0.65	0.70	0.60
Coarse slack	0.55	0.60	0.50

CLEVELAND

The spot market is offering bargains and sales are only fair. Retail dealers are taking anthracite, but are not stocking as heavily as usual. Some Lake coal is being made.

The spot market is showing some very good bargains. Pan Handle three-quarter has been sold at $2 the last week, slack at $1.70 to $1.75 and mine-run as low as $1.80, with a liberal supply to be had at $1.85. The receipts and left overs Monday totaled 300 cars, half of a normal supply. The coarse coal market is only nominal as buyers are loaded up and selling companies are making prices to suit. There is some Youghiogheny slack on the market with Middle district and Fairmont ample for all needs.

The demand is 5 to 10% stronger than a month ago, but the supply of coal still exceeds the demand.

Anthracite here amounts to 500 to 600 cars. The larger retailers are taking all they can store as the April price is the lowest of the year. Some of the smaller dealers are not in position to dock much hard coal, and as the total consumption in this city is only 100,000 to 125,000 tons the shipments never are very large.

Lake Trade—A few Youghiogheny operators are making Lake coal. Cambridge district is shipping some though not in cargo lots. The outlook for Lake trade does not change, and operators are looking forward to very little business until well into June or July 1. What little Lake coal is being made is also producing slack and accounts for Youghiogheny being shipped into Cleveland with prices as low as they are.

A few ships will sail when navigation opens, Apr. 15, but by May 1 not more than 150 of the 450 bulk freight carriers will be in operation. Unless the shipping business materially changes from the present prospects, it will be late in the summer before many boats will be put in commission. The selling price of iron ore has not been established, and no sales have been reported subject to the 1915 price. The total business for the coming season has been estimated at 40,000,000 tons as compared with 32,000,000 tons in 1914.

Quotations on coal for shipment are:

	Pocahontas	Youghiogheny	Bergholz	Fairmont	W. Va. No. 8
Lump	$2.95	......	......	......	......
Lump, ¾ in.	......	2.20@2.25	2.00	$1.90	$1.90@2.00
Egg	2.95	......	......	......	......
Mine run	2.45@2.50	2.10	1.90	1.80	1.75@1.90
Slack	......	1.80	1.75	1.70	......

CINCINNATI

Lack of domestic demand affects the market. Scarcity of screenings and a surplus of prepared grades and mine-run. Producing conditions are excellent.

Relatively cool weather has benefited the retailers to some extent, but now that winter is over they will not replenish their supplies. Moreover, the Lake movement is not due to open up for some time, even under normal conditions, and the present season bids fair to be very backward. The demand for domestic coal, which has kept the market stiff for nut and slack has ceased; very little is being produced, and that is made only at the expense of the prepared grades, which have to be sacrificed. The resulting tendency is to market straight mine-run, of which there is a plentiful supply. Good nut-and-slack is worth more than mine-run of a corresponding grade.

Hopes of an industrial revival are still expressed, though without much foundation. The railroads refuse to enter the market to any great extent. The Lake movement is expected to relieve things appreciably, when it begins, but hold-over stocks are large, and the movement may be sluggish.

LOUISVILLE

Inclement weather stimulates domestic consumption slightly. Operations still curtailed and prices low.

The expected improvement in the demand has not developed and prospects for the future are indefinite. Continuation of the cold, raw weather, past the usual period, is causing a moderate demand for domestic coals, though there is not enough of this business to keep the mines going. Very few are running full time and the rule is from two to four days a week, depending largely on the grade of coal produced.

Prices are practically unchanged, with the best classes of block coals ranging in the neighborhood of $1.35 and $1.40, egg coals at from $1.15 to $1.25, for 2x4-in. and with the best grades of nut and slack firm at around 70c. There are some price cutters who are going considerably below these figures but these are the nominal quotations.

BIRMINGHAM

Market quiet, with prices low. Steam grades the best.

Business on lump coal seems to be at an absolute standstill, with only a few cars moving; prices are at least 50c. per ton less than the average for this period, and even then, dealers are not stocking much. Steam coal, while in a slightly better condition than lump, is far from satisfactory, though the prices are holding up well under the circumstances.

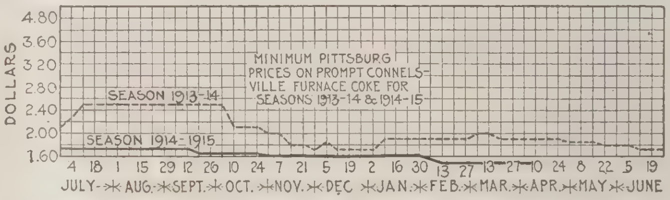
COKE

CONNELLSVILLE

Demand for merchant coke very light. Prices unchanged. Production and shipments slightly increased.

The merchant coke market has been practically without incident in the past week. Here and there tentative inquiries appear for furnace coke but nothing of importance has been closed. Practically all the coke needed to operate furnaces now in blast is provided, and any further activity in merchant coke must depend upon idle furnaces going into blast, something that will hardly occur until there is more activity in the pig iron market. Nothing appears to have been done in the matter of the Pittsburgh Steel Co.'s inquiry for about 20,000 tons of coke a month for the twelvemonth beginning July 1. The market is quotable about as follows: Prompt furnace, $1.50@1.60; contract furnace, to July 1, $1.60@1.65; contract furnace to Dec. 31, $1.75; prompt foundry, $2@2.35; contract foundry (nominal) $2.10@2.30, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Mar. 27 at 285,237 tons, an increase of 5795 tons, and shipments at 284,713 tons, an increase of 3328 tons.



Buffalo—No improvement in the coke market is visible, although reports are received from the ovens of a stiffer market. The same dullness prevails here as for several months. Prices are low and unchanged at $4.25 for best 72-hr. Connellsville foundry and $3.30 for stock coke.

Chicago—The demand for furnace and foundry coke has slightly improved, with prices the same as last week. More inquiries are being received for domestic coke, and it is felt that the retailers will soon commence to stock domestic sizes. Quotations are as follows: Byproduct, $4.45@4.75; Connellsville, $4.65@4.80; Wise County 72-hr. (select), $4.50@4.75; gas coke, $4@4.10; furnace, $4.40@4.65.

MIDDLE WESTERN

CHICAGO

General situation apathetic. Buyers holding off on contracts. Screenings slightly easier. Eastern coals dull.

Slightly colder weather has toned up the demand for some of the Eastern coals in this territory, but it has not caused any decisive change in the situation. Contract business still drags, and it is quite apparent that manufacturing and industrial purchasers are inclined to wait for later developments. Some quotations are being obtained apparently more for comparative purposes with those found in the open markets than with the desire to close. It is clear that some industrial plants are going to take their chances on buying next season in the open market.

Very little activity has been displayed in Hocking coals. A few sales have been made below list, but apparently there is no spot coal on track or in transit.

Prices on eastern Kentucky grades are still demoralized. Some of the Kentucky companies have been crushing mine-run and the coarser sizes in order to supply the steam demand. Eastern Kentucky operators make little progress in placing tonnage of any moment in this territory at the present time.

Improvement is shown in the smokeless situation, and some of this coal is being stored by the retailers. Very little contracting has been done. Splint coals have been rather active, but there has been some consignment coal sold at sacrifice prices. Towards the end of the week, prices were a little firmer after the surplus coal had been eliminated.

A new circular covering Franklin County lump, egg and nut has been issued at $1.35. The Franklin County operators are still maintaining prices, and restricting production in accordance with the demand. Slightly increased orders resulted from the cold snap recently. Some of the Williamson County operators have been crushing the coarser sizes to meet the steam demand. Screenings from southern Illinois mines are still active, and in good demand at the prices of last week.

The weather in Indiana has been against retail sales, so that the operators have only been called upon to ship enough tonnage to meet contract requirements, which are at the minimum. The demand from all sources for Indiana coal is below normal for this season of the year. Prices remain about the same as last week but the supply of screenings is hardly equal to the demand. Some of the operators are considering seriously the question of crushing mine-run for steam use.

In the Springfield District the railroad demand is still very light and few railroad contracts have been renewed. Screenings are about on a parity with last week's prices. Domestic orders have been light. Prevailing quotations are as follows:

	Williamson and Franklin Cos.	Springfield	Sullivan	Clinton	Carterville

ST. LOUIS

Larger tonnage moving but prices are low. Conditions generally unsatisfactory.

The tonnage moving is better than for the past week or two. The continued cool weather stimulated the demand for the domestic coals and this kept the market in a fairly healthy condition. Prices, however, are as low as they can go, and there is no chance at all of any improvement now for several months, unless it be with the steam sizes. Manufacturing conditions in the St. Louis territory are depressed, and there is nothing to indicate that the demand for steam coal will be great enough to cause any record breaking prices this season, which means that such operations as may continue will have an extremely difficult time in making expenses.

Anthracite threatens to be slow during April and May, and the greatest tonnage this year is likely to move in during June and July. Smokeless is a dead issue.

There was no change the first of April in the retail coal prices in St. Louis.

INDIANAPOLIS

Weather still cool enough to keep up a fair demand for domestic lump. Screenings sell readily. Mines making about four days a week. Contract season opening fairly good.

The nights are cold so that coal fires are kept going and fair trade continues in domestic lump. This helps retailers to clean up stocks but is not benefiting the mines appreciably. However, operators are better able to meet the call for screenings, which are commanding relatively the best price, at 85 to 90c. Mine-run No. 4 is selling at $1.10 to $1.20. Mines are making about four days a week.

The contract season has opened fairly good. It had been predicted in some quarters that there would be some hesitation in making or renewing contracts, but operators say they are being signed up about as usual. The retail yards have not yet made the cut in prices that usually follows the close of winter. The factory demand is improving slowly if at all.

PRODUCTION AND TRANSPORTATION STATISTICS

IMPORTS AND EXPORTS

The following is a comparative statement of imports and exports of the United States for January, 1914-15, and for the seven months ending January, 1913-14-15, in long tons:

	Seven Months			January	
Imports from:	1913	1914	1915	1914	1915

VIRGINIAN RAILWAY

Shipments over this road for January of the current year amounted to 344,139 short tons as compared with 276,015 during the preceding month.

FOREIGN MARKETS

GREAT BRITAIN

Mar. 26—Values are strong for all descriptions. Outputs are very short and stemming difficult of arrangement for April positions. Quotations are approximately as follows:

Best Welsh steam.......	Nominal	Best Monmouthshires....	$7.80@7.92
Best seconds...........	$8.16@8.40	Seconds...............	7.56@7.80
Seconds...............	7.68@7.92	Best Cardiff smalls......	4.92@5.05
Best dry coals.........	7.68@7.92	Cargo smalls..........	4.32@4.44

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Chartering is still quiet owing to stemming difficulties. Rates are easy for prompt and steady for forward positions. The following are approximately the current values:

Gibraltar.........	$4.08	Naples..........	$4.56	Las Palmas......	$3.60
Malta...........	....	Venice, Ancona...	9.60	St. Vincent.......	4.80
Marseilles........	5.02	Alexandria.......	6.24	Rio Janeiro......	5.52
Algiers...........	4.63	Port Said........	6.00	Monte Video.....	5.76
Genoa...........	4.56			River Plate......	6.00

Note—These quotations are based on an exchange rate of 24c. to one shilling.

Coal Contracts Pending

Contracts listed in this department are authoritative in every respect except where the source of information is questionable, in which event it is noted. All contracts are listed promptly on receipt and only repeated when additional information becomes available or in the last issue previous to the day on which bids will be closed. Liberal remuneration will be paid for all legitimate notices of this kind sent in.

+Indicates contracts regarding which official information has been received.

+**No. 220—Richmond, Va.**—Bids will be received until 2 p.m., Apr. 14, for furnishing the U. S. Post Office with 400 tons of bituminous coal (p. 446). Address Custodian H. T. Thornton, U. S. Post Office, Richmond, Va.

+**No. 221—Columbus, Ohio**—Bids will be received until 2 p.m., Apr. 14, for furnishing the U. S. Post Office with 700 tons of bituminous coal (p. 446). Address Custodian S. A. Kinnear, U. S. Post Office, Columbus, Ohio.

+**No. 262—St. Louis, Mo.**—Bids will be received until Apr. 14 for furnishing and delivering 360 tons of bituminous coal to the Federal Building (p. 447). Address Custodian Fountain Lorthwell, Federal Bldg., St. Louis, Mo.

+**No. 292—West Point, N. Y.**—Sealed proposals in triplicate will be received until noon, Apr. 15, for furnishing and delivering charcoal, smithing and gas coal, as required at this post for the fiscal year 1916 (p. 487). Address Depot Quartermaster Maj. E. J. Timberlake, West Point, N. Y.

+**No. 363—Toledo, Ohio**—Bids on this contract, which provides for furnishing 10,000 tons of bituminous and 5000 tons of anthracite coal to the local water-works (p. 566), were as follows, per ton:

BIG FOUR COAL CO.—High Service Station, 14,850 B.t.u., $2.05; 13,700 B.t.u., $1.90; 14,445 B.t.u., $2.05; 14,662 B.t.u., $2.10. Low Service, Dorothy Nut, $2.30; 13,800 B.t.u., $2.25.

A. G. BLAIR CO.—High-Service Station, Dorothy 2-in. nut and slack, $2.

CENTRAL STATES COAL CO.—High-Service Station, Dorothy 2-in. nut and slack, $2.05; Winifrede washed pea coal, $2.15. Low-Service Station, 14,750 B.t.u., $2.15.

W. A. GOSLINE CO.—High-Service Station, 12,761 B.t.u., $1.625; 14,312 B.t.u., $1.925; 13,326 B.t.u., $1.83. Low-Service Station, Hocking washed pea, 3x1¼-in. nut, $2.05; Ethel Logan, W. Va., 2x¾-in. nut, $2.19.

JEWETT, BIGELOW & BROOKS—High-Service Station, 13,500 to 13,600 B.t.u., $1.90; 13,300 B.t.u., $1.83.

GEORGE M. JONES CO.—High-Service Station, 12,523 B.t.u., $1.60. Low-Service Station, 13,514 B.t.u., $2.25.

PETER KOENIG COAL CO.—High-Service Station, 14,000 B.t.u., $2.10.

MANCOURT-WINTERS CO.—High-Service Station, 14,000 B.t.u., $1.95. Low-Service Station, 14,000 B.t.u., $2.35.

NEW RIVER & OHIO COAL CO.—High-Service Station, 14,000 B.t.u., $2.10; 13,500 B.t.u., $1.89. Low-Service Station, Coal Valley nut, $2.15.

OHIO & KENTUCKY COAL CO.—High-Service Station, Dorothy nut, pea and slack, $2.05; 13,188 B.t.u., $1.85. Low-Service Station, Dorothy nut, $2.35; 14,216 B.t.u., $2.35; 14,352 B.t.u., $2.50.

JOHN T. SOLON—High-Service Station, 14,443 B.t.u., $1.80. Low-Service Station, 12,086 B.t.u., $2.05.

WEST VIRGINIA POCAHONTAS SALES CORPORATION—High-Service Station, 14,300 B.t.u., $1.95. Low-Service Station, Panther nut and slack, $1.95.

W. H. WARNER COAL CO.—High-Service Station, 12,500 B.t.u., $1.54.

WEST CRESCENT FUEL CO.—High-Service Station, 14,100 B.t.u., $1.90; 11,250 B.t.u., $1.70; 14,250 B.t.u., $2.03; 14,100 B.t.u., $2. Low-Service Station, 14,100 B.t.u., $2.40; 13,560 B.t.u., $2.05. Address Supt. G. A. Gessner, Jr., City Water Department, Toledo, Ohio.

+**No. 367—Dunkirk, N. Y.**—Bids will be received until Apr. 13 for furnishing the Board of Water Commissioners with coal for the ensuing year (p. 566). Address Secy. Baumgartner, Board of Water Commissioners, Dunkirk, N. Y.

+**No. 382—New York, N. Y.**—Bids on this contract (p. 567), which provides for furnishing 1200 gross tons of No. 3 buckwheat coal and 400 tons semibituminous mine-run coal, at Amsterdam Ave. and 139th St., were as follows:

Bidders	Buckwheat	Semibituminous
C. D. Norton	$2.36	$3.34
J. W. Peale	2.39	3.41
Pattison & Bowns	2.53	3.43

Address Curator R. V. Davis, Room 114 Main Building, 139th St. and Convent Ave., New York.

+**No. 383—New York, N. Y.**—The bidders on this contract (p. 567), which provides for furnishing and delivering coal to Bellevue and Allied Hospitals, Departments of Correction, Fire, Public Charities, Parks, Bronx and Queens Parks, were as follows: T. R. Thorn, J. E. Donovan, A. J. J. McCullum, S. Trimmer & Sons, Wm. Brennen, Jos. Johnson's Sons, Pattison & Bowns, C. D. Norton, Bacon Coal Co., Burns Bros., A. D. Dreyer, E. Nichols & Co., G. D. Harris, C. Vanderbilt, S. Hore, Jamieson & Bond, Shrader Coal Co., J. F. Schmadeke, Gavin Rowe, M. L. Bird, J. W. Peale, William Farrell, Jergen Rathgen, Parksburg Coal Co., O. J. Stephens, J. E. Becker, Meyer, Denker & Sinram, J. S. Conabeer. Address Contract Clerk, Room 1226 Municipal Bldg., New York.

+**No. 395—Chicago, Ill.**—Bids will be received until 11 a.m., Apr. 15, for furnishing coal required at the posts of the Central Department during the fiscal year commencing July 1 (p. 567). Address the Depot Quartermaster, 566 Federal Building, Chicago, Ill.

+**No. 396—National Soldiers' Home, Va.**—Sealed proposals will be received until 1:30 p.m., Apr. 16, for furnishing 10,000 tons of bituminous coal to the Southern Branch N. H. D. V. S. National Soldiers' Home (p. 567). Address Treas. S. E. Skinner, National Soldiers' Home, Va.

+**No. 413—Albany, N. Y.**—Sealed proposals will be received until 10 a.m., Apr. 20, for furnishing and delivering the following:

No. 1—About 10,000 tons of No. 1 buckwheat anthracite and 2500 tons of bituminous slack coal at the State Power House.

No. 2—About 600 tons of grate and 50 tons of stove or chestnut to the State Hall, at the Agricultural and Geological Hall and the Executive Mansion. Address Supt. of Pub. Bldgs. William H. Storrs, Capitol, Albany, N. Y.

+**No. 422—Buffalo, N. Y.**—Bids on this contract (p. 568), which provides for furnishing and delivering about 500 tons of coal at the various bridges in the city, were as follows:

C. A. & M. KEISER—For grate size: April, $5.45; May, $5.55; June, $5.65; July, $5.75; August, $5.85; September to Mar. 31, 1916, $5.95.

BUFFALO FUEL CO.—Grate size: April, $5.47; May, $5.57; June, $5.67; July, $5.77; August, $5.87; September to Mar. 31, 1916, $5.97.

Address Asst. Engr. Frank E. Jackson, Bureau of Engineering, Municipal Building, Buffalo, N. Y.

+**No. 437—Boston, Mass.**—Sealed proposals will be received until 2 p.m., Apr. 14, for furnishing coal to the Post Office and Sub-Treasury Building during the fiscal year ending June 30, 1916 (p. 627). Address Custodian William F. Murray, U. S. Post Office and Sub-Treasury, Boston, Mass.

+**No. 439—Fort Sam Houston, Tex.**—Sealed proposals will be received until 11 a.m., Apr. 15, for furnishing coal to the Southern Department posts during the fiscal year commencing July 1, 1915 (p. 627). Address Depot Quartermaster G. S. Bingham, Fort Sam Houston, Tex.

+**No. 448—Springfield, Mass.**—Sealed proposals will be received until 10 a.m., Apr. 15, for furnishing coal to the armory for the fiscal year commencing July 1, 1915 (p. 627). Address Depot Quartermaster, Springfield Armory, Springfield, Mass.

No. 451—Chicago, Ill.—The American Sand & Gravel Co. will purchase throughout the coming year about 100 cars of Illinois or Indiana lump coal. The first purchase will be made about Apr. 15 (p. 627). Address Gen. Mgr. Fisher, American Sand & Gravel Co., Chicago, Ill.

+**No. 452—San Francisco, Calif.**—Sealed proposals will be received until 10 a.m., Apr. 15, for furnishing bituminous mine-run coal for the army transports and for the National Cemetery and Recruiting Office (p. 627). Address Depot Quartermaster Lieut.-Col. W. H. Hart, 1086 North Point St., San Francisco, Calif.

+**No. 466—Reading, Penn.**—Sealed proposals will be received until 10 a.m., Apr. 14, for furnishing coal to the Berks

County Prison (p. 628). Address County Controller D. K. Hoch, County Controller's Office, Reading, Penn.

+No. 475—Rock Island, Ill.—Sealed proposals will be received until 11 a.m., Apr. 15, for furnishing fuel to the Arsenal for the fiscal year commencing July 1 (p. 628). Address Lieut.-Col. Kenneth Morton, Rock Island Arsenal, Ill.

NEW BUSINESS

+No. 486—Boston, Mass.—Bids will be received some time during May for furnishing the various state institutions of the Board of Insanity with a year's supply of coal. The quantities involved and the price per ton of last year's supply were as follows:

Institution	Tons	Price	Delivery
Worcester Hospital	5500	$4.55	In bins
Taunton Hospital	2500	4.18	At siding or trestle
Northampton Hospital	2000	4.15	At siding or trestle
Danvers Hospital	6500	3.64	F.o.b. Salem
Westboro Hospital	4750	3.53	F.o.b. Providence
Boston Hospital (Main)....	6000	4.95	In bins
Boston Hospital (Psychopathic)	1500	4.92	In bins
Worcester Asylum	1600	4.10	At siding or trestle
Medfield Asylum	6000	4.28	At siding or trestle
Gardner Colony	800	4.35	At siding or trestle
Monson Hospital	4000	4.20	At siding or trestle
Foxboro Hospital	1300	4.38	At siding or trestle
Waverley (Mass. School for for Feeble-Minded)......	3000	4.05	F.o.b. Mystic Wharf
Wrentham	1500	4.28	Railroad station

Address Financial Agt. E. R. Libby, Room 6, State House, Boston, Mass.

+No. 487—Reading, Ohio—The Municipal Water Works & Electric Light Plant will be in the market about May 1 for 2000 tons of New River smokeless mine-run coal, the present contract being closed at $2.55 per ton. Address Supt. Barrett A. Burns, Municipal Water Works & Electric Light Plant, Reading, Ohio.

No. 488—Hartwell, Ga.—The Franklin Light & Power Co. of this place will be in the market about May 1 for 1500 tons of Brushy Mountain screened coal, the present contract being closed at $3.40, delivered. Address Mgr. Albert L. Couch, Franklin Light & Power Co., Hartwell, Ga.

+No. 489—Staples, Minn.—The Municipal Electric Light Plant here will be in the market about May 1 for 2000 tons of Youghiogheny screenings. The present contract was closed at $3.25 per ton. Address Supt. John Effinger, Municipal Electric Light Plant, Staples, Minn.

No. 490—Chicago, Ill.—The Armstrong Paint & Varnish Co. will contract for a year's supply of No. 5 washed Illinois or Indiana coal. The contract calls for about 18 carloads. Address Purchasing Agent, Armstrong Paint & Varnish Co., Chicago, Ill.

No. 491—Alexandria, Minn.—The Board of Public Works at this place will be in the market about May 1 for 1500 to 1800 tons of Elkhorn and Youghiogheny screenings. The present contract was closed at $3.75 per ton. Address Chief Clerk, Board of Public Works, Alexandria, Minn.

+No. 492—New Orleans, La.—Sealed proposals will be received until 11 a.m., May 1, for furnishing coal for the United States plant from July 1, 1915, to June 30, 1916. Address Maj. Edward H. Schulz, Room 325, Custom House, New Orleans, La.

No. 493—Yonkers, N. Y.—Bids are requested for furnishing approximately 400 tons of coal to be delivered at various apartments. Address J. Romaine Brown & Co., Real Estate Agents, 506 South Broadway, Yonkers, N. Y.

No. 494—Madison, Ill.—The Barber Asphalt Co. of this place usually contracts during April for a supply of standard 2-in. lump coal. The company consumes from 12 to 15 cars per month. Address Purchasing Agent, Barber Asphalt Co., Madison, Ill.

+No. 495—Paterson, N. J.—Bids will be received about May 1 for furnishing 4000 tons of anthracite coal in pea, stove and egg sizes. The present contract was closed as follows: Pea, $4.30; stove, $5.60 to $6.10; egg, $5.60 to $6.10. Address Secy. James F. Dunphey, Board of Education, Room 24, City Hall, Paterson, N. J.

+No. 496—Malden, Mass.—The Board of Education will contract about May 1 for 1600 tons of anthracite egg coal and 700 tons of bituminous New River coal. The present contract was closed at $5.80 for anthracite and $4.68 for bituminous. Address the Fuel Committee, High School Bldg., Malden, Mass.

+No. 497—Richmond, Va.—The local city government will be in the market during May for its annual requirements of coal, which amounts to about 250 tons of anthracite, and 2000 tons of steam coal. On last year's purchase, the anthracite was bought at $6.33 per ton, and the steam coal at $3.39 per ton, delivered in the cellar and weighed on city scales. The best New River mine-run steam coal and Pennsylvania anthracite are used. The call for bids is advertised. Address Clk. and Superv. C. P. Walford, Committee on Buildings and Furniture, School Board, Richmond, Va.

+No. 498—Grafton, N. D.—The local City Light & Water Plant will contract on the first Monday in May for its annual requirements of coal involving about 550 tons of screened lump Youiogheny. The business is let on a competitive basis, and last year brought $5.90 per ton, delivered in the bin. Address Supt. Karl H. Smith, City Light & Water Plant, Grafton, N. D.

No. 499—Chicago, Ill.—Birk Bros. Brewing Co. will purchase 500 tons per month of Illinois or Indiana mine-run. They will be in the market about May 1 for one month's supply, and will make subsequent purchases the first of each succeeding month throughout the year. Address, Purchasing Agent, Birk Bros. Brewing Co., Chicago, Ill.

No. 500—Louisville, Ky.—The Christ Brewing Co. will contract this month for a year's supply of nut and slack. The company usually consumes three or more car loads a month. Delivery to be by rail on L. & N. terminal. Address J. B. Rapier, Christ Brewing Co., 318 Baxter Ave., Louisville, Ky.

+No. 501—Sullivan, Ill.—The local City Government will contract for its annual requirements of coal about May 9. Last year 1200 tons of mine-run coal were purchased at $1.75 delivered in the power house. The business is let on competitive bids. Address Supt. Hugh Hoke, Sullivan, Ill.

+No. 502—Perry, Okla.—The local Water & Light Dept. will be in the market during May for about 1100 tons of bituminous coal. Slack is used almost exclusively, and the average price for all the requirements is about $2.20. The business is let on competitive bids. Address Supt. J. G. Cronin, Water & Light Department, Perry, Okla.

+No. 503—Evanston, Ill.—The local City Government usually contracts for its annual requirements of coal during May. About 1400 tons of both bituminous and anthracite are required and the purchase is made on a B.t.u. basis. The prices at which the business was concluded last year were: Pocahontas, $4.50; anthracite, $7.45. Bids are solicited from all the local dealers. Address the Board of Education, Haven High School, Evanston, Ill.

+No. 504—Dover, N. J.—Sealed proposals in triplicate will be received until 1 p.m., Apr. 26, for furnishing and delivering about 8000 tons of bituminous slack or mine-run coal at the Picatinny Arsenal on the Wharton & Northern R.R. Address the Commanding Officer, Picatinny Arsenal, Dover, N. J.

No. 505—Louisville, Ky.—The Finzer Tobacco Co., which usually consumes about 225 tons of nut and slack coal a year, will contract May 1 for a year's supply. Delivery by wagon as instructed. Address Purchasing Agent, Finzer Tobacco Co., 4019 Finzer Ave., Louisville, Ky.

No. 506—Chicago, Ill.—The Barrett Mfg. Co. will be in the market about Apr. 15 for 20,000 tons Illinois screenings. Contract for one year. Address Purchasing Agent, Barrett Mfg. Co., Chicago, Ill.

+No. 507—Allentown, Penn.—The Board of Education at this place will be in the market during May for its annual requirements of coal, which involves from 1600 to 1800 tons of pea, the price last year being $4.25 per ton. The call for bids is always advertised. Address Board of Directors, 540 North Sixth St., Allentown, Penn.

+No. 508—Philadelphia, Penn.—The Board of Education here will be in the market during May for its annual requirements of coal, bids for which are advertised in three papers for three weeks. The tonnage involved aggregates approximately 4500 tons of the best Lehigh or Schuylkill egg, stove, nut, pea and rice coal, prices ranging from $3.28 to $7.15 per ton last year. About 13,000 tons are bought under the B.t.u. system and the balance on specifications. Address Superintendent of Supplies, Board of Public Education, Room 392 City Hall, Philadelphia, Penn.

+No. 509—Chelsea, Mass.—The local city government will be in the market during May for its annual requirements of coal which aggregate about 1700 tons. The grades bought last year together with prices were: Broken $5.87, soft $4.40, egg coal $6.48. Address Superintendent of Public Buildings, City Hall, Chelsea, Mass.

No. 510—Chicago, Ill.—Darling & Co. is now in the market for two cars per day of Illinois or Indiana screenings. Contract for one year.

+No. 511—National Military Home, Ohio—Sealed proposals will be received at the office of the Treasurer, Central Branch, N. H. D. V. S., National Military Home, Ohio, for furnishing and delivering coal supplies. Specifications and blank proposals can be had upon application to the Treasurer. Bids close at 1 p.m., May 1, 1915. Address Treasurer W. H. Ortt, National Military Home, Ohio.

No. 512—Chicago, Ill.—The Barber Asphalt Paving Co. will be in the market about Apr. 25 for one car per day of southern Illinois screenings. Contract will run for one year. Address, Purchasing Agent, Barber Asphalt Paving Co., Chicago, Ill.

+No. 513—Pawnee, Okla.—The local city government contracts for its coal requirements during May. About 1500 tons of slack and mine-run coal is required and the customary price is $1.55 per ton. It is let on competitive bids. Address Clk. H. A. Beproul, Pawnee, Okla.

+No. 514—Springfield, Ill.—The local School Board will soon contract for its annual requirements of coal. During the season 1913-1914, the requirements covered 75,202 bu. of mine-run coal, for which $1.54 was paid, and 29,691 bu. of pea coal at $1.44; the respective prices for 1914-1915 were, mine-run, $1.74, and pea, $1.54. The call for bids is advertised and the business is let on the recommendation of the Committee on Supplies, approved by the Board. Address Committee on Supplies, Leland Office Bldg., sixth floor, Springfield, Ill.

+No. 515—Elmira, N. Y.—The Board of Education at this place will be in the market during May for its annual requirements of coal. The last purchase involved 687 tons of anthracite and 1167 tons of bituminous coal, the former costing $6 per ton and the latter $3.25 per ton. Address Board of Education, Elmira, N. Y.

+No. 516—Milledgeville, Ga.—Sealed proposals will be received until 10 a.m., Apr. 28, for furnishing about 10,000 tons of mine-run steam coal to the Georgia State Sanitarium. Delivery is to be made as required at sanitarium, on Milledgeville R.R. or Central of Georgia R.R. and at water-works pumping station. Address Steward L. J. Lamar, Georgia State Sanitarium, Milledgeville, Ga.

No. 517—Louisville, Ky.—The Jefferson Realty Co., which consumes about four tons of pea and slack a day, will contract on Apr. 10 for a year's supply of this coal at a cost not to exceed $1.50 per ton. Delivery by wagon. Address W. C. Dabney, Jefferson Realty Co., Paul Jones Bldg., Louisville, Ky.

No. 518—Chicago, Ill.—The Bowman Dairy Co. will be in the market about Apr. 15 for one year's contract for 30 cars per month of southern Illinois screenings. Address Pur. Agt. D. B. Peck, Bowman Dairy Co., Chicago, Ill.

+No. 519—Seattle, Wash.—Sealed proposals will be received until 11 a.m., Apr. 26, for furnishing bituminous fuel and steam coal as required by the Quartermaster Corps at Seattle and Tacoma, during the year 1916. Address Col. George B. Davis, Depot Quartermaster's Office, Seattle, Wash.

+No. 520—Jeffersonville, Ind.—Sealed proposals will be received until 10 a.m., Apr. 21, for furnishing the Depot of the Quartermaster's Corps with such quantities of bituminous coal as may be required during the period commencing July 1, 1915, and ending June 30, 1916. Address Depot Quartermaster Maj. Joseph T. Davidson, Jeffersonville, Ind.

+No. 521—Front Royal, Va.—Sealed proposals in triplicate will be received until 2 p.m., Apr. 21, for furnishing about 345 tons of anthracite coal to the Front Royal Remount Depot. Address Depot Quartermaster, Front Royal, Va.

+No. 522—Lorain, Ohio—Bids will be received until noon, Apr. 19, for furnishing coal for the school year 1915-1916. Address Clk. O. E. Bruell, Board of Education, Lorain, Ohio.

+No. 523—Xenia, Ohio—Sealed proposals will be received until noon, Apr. 22, for furnishing about 470 tons of Pocahontas mine-run coal and 150 tons of Hocking lump coal. Coal is to be delivered in the bins of the different schoolhouses and is to be weighed on scales designated by the Board. Bids should be made f.o.b. Xenia. Address Clk. B. Schlesinger, 33 East Main St., Xenia, Ohio.

+No. 524—Washington, D. C.—Sealed proposals will be received until 2 p.m., May 3, for furnishing and delivering during the fiscal year ending June 30, 1916, coal for use in the various branches of the Government of the District of Columbia. Address Comr. Oliver P. Newman, Room 320, District Building, Washington, D. C.

+No. 525—Washington, D. C.—The following are the bids received on Mar. 29 for furnishing to the Naval Service about 100,000 tons of coal. Coal is to be of good quality, steaming, semibituminous mine-run, with at least 40% lump, and must be dry and practically free from slate, dirt, sulphur and other impurities: Castner, Curran & Bullitt, $2.75; C. G. Blake Co., $2.85; William C. Atwater & Co., $2.80; Clinchfield Fuel Co., $2.50; Chesapeake & Ohio Coal & Coke Co., $2.75; Crozer-Pocahontas Co., $2.85; Gulf Smokeless Coal Co., $2.75; Maryland Coal & Coke Co., at the rate of not less than 8000 tons per month, $2.73; at the rate of not less than 5000 tons per month, $2.83; Archibald McNeil & Sons Co., $2.74; Pocahontas Fuel Co., $2.85; West Virginia Coal Co., $2.80; Wittenburg Coal Co., $2.80. Address Paymaster-Gen. of the Navy Samuel McGowan, Washington, D. C.

+No. 526—Easton, Penn.—Sealed proposals were received up to 4 p.m., Apr. 7, for furnishing the various school buildings with 50 tons pea, 100 tons nut, 550 tons stove and 50 tons egg coal. All coal is to be well screened and from either Highland or Jeddo collieries. Address Chn. Dr. F. C. Sandt, Committee on Supplies, Easton, Penn.

+No. 527—San Francisco, Calif.—Sealed bids will be received until 11 a.m., Apr. 23, for furnishing coal and coke as required at the Posts in the Western Departments during the fiscal year commencing July 1, 1915. Address Col. H. S. Wallace, "Chronicle" Building, San Francisco, Calif.

No. 528—Boston, Mass.—The Boston Elevated Ry. Co. recently requested proposals for its coal requirements for one-, three- and five-year periods, and expects to close the business shortly. Address Pur. Agt. Edward Mahler, Bureau of Purchase, Boston Elevated Ry. Co., 101 Milk St., Boston, Mass.

No. 529—Freeport, Ill.—The Freeport Gas Co. will soon be in the market for about two cars per month of northern Illinois egg coal. Bidders should state the location of their mines and give the freight rate to Freeport. Address Mgr. E. D. V. Dickey, Freeport Gas Co., 156 Stephenson St., Freeport, Ill.

+No. 530—Muscatine, Ohio—Sealed bids will be received until 5 p.m., Apr. 12, for furnishing about 300 tons of 1½-in. or 2-in. screened lump coal. Specifications are on file with the County Auditors in Muscatine and Louisa Counties, also the Harman Engineering Co., Peoria, Ill. Address County Audr. H. C. Shoemaker, Muscatine, Ohio.

No. 531—Frankfort, Ky.—Awards by the State Prison Commission for furnishing 12,000 tons of coal for the State Reformatory and 7000 for the School of Reform are expected to be made shortly. Address State Prison Commission, Frankfort, Ky.

No. 532—Cincinnati, Ohio—Sealed bids will be received until noon, Apr. 14, for furnishing and delivering coal for the River Pumping Station and Water-Works Department. Proposals must be accompanied by a bond for $1000 or a certified check. Bids must be submitted on printed forms, which will be furnished on request. Address Dir. of Pub. Service Philip Fosdick, City Hall, Cincinnati, Ohio.

No. 533—Chicago, Ill.—The Cole Manufacturing Co. here purchases 10 to 14 cars of Indiana mine-run coal per year for heating purposes only. The company does not contract. Address C. C. Cole, Cole Manufacturing Co., 3218 South Western Ave., Chicago, Ill.

CONTRACTS AWARDED

Note—Successful bidders are noted in **bold face** type.

+No. 312—Chicago, Ill.—The awards on this contract (p. 448), which provides for furnishing and delivering coal to the various pumping stations, were as follows, per ton:

Bickett Coal & Coke Co.—Chicago Ave. (lump), $2.301; 14th St., (lump), $2.394; Springfield Ave. (screenings), $2.02; Rogers Park (lump), $2.92; 68th St. (screenings), $1.59; Lake View (nut), $2.61.

Edner Coal & Coke Co.—Central Park Ave. (lump), $1.97; Roseland (screenings), $1.583.

Pilsen Coal Co.—22d St. (lump), $2.168; Harrison St. (screenings), $1.96.

Address Comr. of Pub. Wks. L. E. McGann, Room 406, City Hall, Chicago, Ill.

No. 331—Springfield, Mass.—This contract, which provides for furnishing 8000 to 10,000 tons of anthracite and bituminous coal (pp. 527 and 566), has been awarded as follows:

Maynard Coal Co.—250 tons Lackawanna stove or nut coal for Outside Poor; 55 tons Lackawanna stove or nut for Soldiers' Relief; delivery to be in ¼- and ½-ton lots as called for, at $7.24 per ton.

Ehrlich Coal Co.—600 tons of Lehigh stove for Departments of Streets and Engineering, delivery to steam rollers, etc., in any part of the city, 500 tons prior to Sept. 1, 1915, 100 tons after Sept. 1, at $6.78 per ton; 507 tons egg, 45 tons nut, 22 tons stove, for Fire Department; 12 tons Lehigh nut or stove for Board of Health; 25 tons Lehigh stove for Police Station No. 2; Indian Orchard, egg and stove, $6.90; nut, $7.10.

Converse Coal Co.—3300 tons bituminous for various schools; 700 tons for Almshouse; 900 tons for Municipal Heating Plant, at $4.43 per ton; 1475 tons of Lackawanna egg and stove for various schools, at $6.83 per ton.

Tait Coal Co.—1930 gross tons grate coal for various schools, at $6.50 per gross ton.

+No. 332—Buffalo, N. Y.—This contract (p. 528), involving 35,000 tons of ¾-in. slack coal, has been awarded to the **Frick Coal & Coke Co.** at $1.88 per ton. Address Comr.-Colonel Francis G. Ward, Department of Public Works, Buffalo, N. Y.

Cable Address, "COAGE," N. Y.

Correspondence suitable for the columns of COAL AGE solicited and paid for. Name and address of correspondents must be given—not necessarily for publication. Subscription price $3 per year, in advance, for 52 numbers to any postoffice in the United States or possessions, and Mexico. $4 to Canada. $5 or its equivalent to any other foreign country.

Subscribers in Great Britain, Europe and the British Colonies in the Eastern Hemisphere may send their subscriptions to the London Office, 6 Bouverie St., London, E. C., England. Notice to change address should be written to the NewYork Office in every instance.

Advertising copy should reach New York Office by Thursday of week prior to date of issue. Entered as second class matter, October 14, 1911, at the Postoffice at New York, New York, under the Act of March 3, 1879.

VOLUME 7 APRIL 17, 1915 NUMBER 16

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

Foreword—What Is a Coal Operator?: *Page* 667

A humorous answer to the query indicated in the subject. An attempt is made to show that the path of the coal-mine operator is not a smooth one. Timely reference, in a good-natured way, is made to some of the difficulties that beset operators. COAL AGE, Vol. 7.

Ideas and Suggestions: *Pages* 668-669

The Value of Coöperation among Employees at a Coal Mine—How One Company Solved the Question of Credits.

***The Coal Fields of West Virginia:** *Pages* 670-672

Description of the coal fields of West Virginia, showing the location of the important districts and the geology of the coal-bearing measures. A brief sketch is given of the commercial importance of the different seams, showing the principal railroads in the various districts. J. S. Burrows. COAL AGE, Vol. 7.

***The Successful Use of the Chain-Grate Stoker:** *Pages* 673-675

For many years the use of the chain-grate stoker was confined to the high-volatile, high-moisture and high-ash but noncoking coals of the West and Middle West. More recently a type of this machine has been devised which successfully handles the low-ash coking coals of the East. T. A. Marsh. COAL AGE, Vol. 7.

Efficiency as Applied to Mining: *Pages* 675-678

The basis of efficiency work, which is the increasing of the amount of work of the individual and the proper arrangement of that work, is as applicable to mining as to manufacturing. The means used for accomplishing this are keeping simple records and timing the details of each operation. Hugh Archbald. COAL AGE, Vol. 7.

***Of Interest to Miners:** *Pages* 678-679

John Majer. COAL AGE, Vol. 7.

Coal Used in Power Plants: *Page* 679

Rhode Island Anthracite: *Page* 679

***A Powerful Tractor for Heavy Delivery Service:** *Pages* 680-682

Description of the new Knox tractor, which embodies the latest ideas in heavy motor construction. The machine transports a load of 20 tons and is equipped with electric starter, a new type of direct and hydraulic brakes and several other novel features developed after considerable experimentation. COAL AGE, Vol. 7.

Extracts from a Superintendent's Diary: *Page* 682

***A British View on Our Export Opportunities—II:** *Pages* 683-685

This is the second and concluding article by Mr. Breffit. The ultimate prominence of the United States coals in the world's markets is now an accepted fact. The author also discusses the adaptability of our coals for export business and outlines a tentative scheme for entering the foreign markets. G. Breffit. COAL AGE, Vol. 7.

Some Notes on Fuel Consumption at San Francisco: *Page* 685

Developments in Ocean-Shipping Facilities: *Page* 685

RUN-OF-MINE TALKS

ON YOUR BUSINESS AND OURS

By the Business Manager

Seven Letters from Illinois

NELS G. JOHNSON, Mine Manager of the W. P. Rend Collieries Co., Rend, Ill., writes:

"I have read Coal Age for the last three years and have found it to be a great help in my work as it gives me the ideas of all the greatest mining men in the United States and the old countries. The advertising is certainly of the very best and no Superintendent can very well do without it."

* * *

A. H. SHAW, Superintendent of the Western Coal and Mining Co., at Bush, Ill., writes:

"The advertising features of Coal Age are especially good. We find practically all of the foremost companies engaged in the manufacturing and selling of mining supplies represented in the advertising section. Your magazine is especially useful at requisition time, as we look to the advertising columns and make recommendations for purchases from the many advertisers found therein."

* * *

HENRY D. THOMPSON, Superintendent of the Big Muddy Coal and Iron Co., at Herrin, Ill., writes·

"I have been reading Coal Age since the first copy was published and while there have been many articles published in it that were helpful to me, I must say that the advertising section has been equally helpful. It has kept me posted on new and up-to-date machinery and equipment, especially so with regard to coal cutting machines and haulage locomotives. The kind of advertising shown in Coal Age is reliable and very interesting to mining men."

W. B. MILLER, Manager of Madison Mine, No. 9, of the Madison Coal Corporation at Dewmaine, Ill., writes:

"I have been a subscriber to Coal Age for nearly two years and I read everything from cover to cover. I consider your paper very instructive to the Mine Manager or Superintendent and must say that I am especially impressed with your advertising columns."

* * *

B. SCHETTLER, General Manager of the Benton Coal Co., Benton, Ill., writes:

"We have found the advertising in Coal Age to be of great assistance to us in the purchase of supplies. We have also found in your advertisers only the most reliable firms in the country whose advertisements are always worth their face value."

* * *

LEE HASKINS, Superintendent of the Marion County Coal Co., Centralia, Ill., writes;

"Whenever I am in need of any equipment for the mine I look over the advertising pages of Coal Age."

* * *

JOHN BURKE, Mine Manager of Buxton Mine, of the Breese-Trenton Mining Co., at Beckemeyer, Ill., writes:

"I go through the advertising section of Coal Age as much as I do the editorials, and recommend the purchase of articles as advertised whenever in need of same."

Wise coal mine officials do their buying through Coal Age ads—they save time and eliminate taking chances.

COAL AGE

ONE OF THE HILL ENGINEERING WEEKLIES

Vol. 7 NEW YORK, APRIL 17, 1915 No. 16

What Is a Coal Operator?

The coal operator is an integral part of a coal mine, or rather, the coal mine might be called the product of the operator. To get a coal mine in operation you procure the component parts, which are as follows, figuratively speaking:

One tipple, one more or less complete line of mechanical equipment, one ditto electrical equipment, one hole in the ground, some capital and one large bonded indebtedness. After being carefully proportioned, mix, and add one labor union, and season with strikes. (Most operators prefer a very light seasoning.)

Some operators think labor unions are not at all essential; others who have labor unions wouldn't do without them—for the same reason that Bill Jones wouldn't do without the wart on his nose. The only way to get rid of the wart was to yield possession; that is—cut off the nose. The only way to get even with a labor union is to give 'em the mine; that would be about all from the labor union. Some operators think that's going too far.

Operators are both "homogeneous" and "cavernniverous—"homogeneous" because they have homes like real folks, and "cavernniverous" because they are supposed to dig millions out of a cavern or coal mine.

There was once an operator who made real money operating a coal mine. His coat sleeves were torn off and his arms yanked out of their sockets by brother operators who sought to lead him aside that he might tell them exactly how he did it.

Operators abound in Ohio and other valleys. They don't care much about abounding on the Ohio side—not in eastern Ohio anyway — they'd rather abound in West Virginia. Most of them that had car-fare are abounding down that way since "the little unpleasantness." Some one told them a mine in West Virginia would make a noise like a dividend.

Ohio operators are strong for Jimmy Cox—he's henchman and legislature. You know, they presented the operators with the "Run-of-Mine System."

Operators have unique forms of amusement. Among the more popular games is that of "Making an Agreement with the Miners." This game is not so popular in some sections as it is in others. They don't play it at all in Colorado. Someone tried to introduce it out that way, but after it had been censored by the Rockefeller Foundation it didn't look like the same old game. Another pleasant little game is called, "Going into the Hands of a Receiver"—very popular in Ohio since April 1, 1914. In Pennsylvania, they have for amusement a sport entitled, "Our Mines are Idle because the Men Don't Have their Buttons"—a very exciting little game. In Arkansas they play "Tipple, Tipple, Who Burned the Tipple?"

Some time ago a friend pointed out to me what he thought was a very typical specimen of the Genus Operatacuss. Much impressed, I approached and asked if I might have the privilege of propounding a personal question.

"Sure," replied the Operatacuss. "Shoot!"

"What is an operator?" quoth I.

"An operator, my boy, is the man who pays the bills. Most any one wins sometimes, but an operator—never!"

—By C. P. Shockley

Ideas and Suggestions

Value of Co-operation among Coal-Mine Employees

By George S. Brackett*

Coöperation at a mine means the united efforts of all employees working jointly to produce coal with a minimum waste of labor.

When real coöperation exists, an employee working by the hour will complete his allotted work and go home before the day is over on short time. If the services of a workman on day labor are not necessary, the man will promptly say so. Coöperation means further that employees at a mine take special pride in satisfying the consumers of the coal and in the prompt filling of the orders.

Most operators know what their coal is costing them under present conditions; but how many can even estimate what the cost will be under the above system of supposedly ideal coöperation? I have known small coal mines which approached such a coöperative plan, but I never saw that system in operation at a large mine.

Let us assume two average mines embodying the general run of mining difficulties, the only exception being that one mine has a force of day-men working efficiently and contentedly, saving in their supplies and tools and endeavoring to render the company a fair day's work in return for their wages. It is further assumed that these men act in every way as if they were working for themselves. In the other mine, the day laborers think only of doing as little work as possible.

The Mining Cost Differs

At the two mines in question the payroll cost will differ considerably, and the management of the first-mentioned mine has effected a great economy by having constructed an organization which will operate the mine successfully under adverse difficulties. Labor-saving machinery and modern appliances are undoubtedly paying investments; yet a force of men who have a fair conception of real honest coöperation and a genuine desire to do their duty will operate a mine successfully, even though handicapped by a lack of proper equipment.

Welfare work of all description is the honest effort on the part of operators to produce satisfaction and coöperation among their employees. It has called for the expenditure of large sums, and the result has been a sad misunderstanding in many cases. These expenditures appear to the miner to be monuments to excessive profits, while in effect they are a vain attempt on the part of the operator to produce a favorable spirit among the employees so that dividends may be declared some time in the future. It is a case where employer and employee are misunderstood to their mutual disadvantage.

Few men can put the proper energy into their work when they imagine that they are being imposed upon, and profits can be realized for long periods only where the employees are contented. These conditions may be brought about without expenditures on welfare work, and the operator's personality, fairness and fellowship may be his most valuable asset; for we find coöperative principles in small mines with crude houses and poor equipment.

An Interesting Question

I have asked many practical coal men the following question: "If you owned a small coal mine fully equipped and developed, ready to ship a small output, so arranged that you could with your own hands haul the coal, dump it, sharpen the miner's picks, trim the railroad car, clean the ditches, lay the track and do everything yourself that needed to be done other than the actual loading of the coal in the working places, how many tons of coal could you put on the railroad car per day? Remember that you are the only man on the job except the miners." The answers average 25 tons. This means that the actual value of all the work around a coal mine (excepting the miners') should follow the proportion of 25 tons per day-man per day. In order to confirm this base, the following are selected from a list of 454 mines in two states:

1. Averaged 42 tons per day for one year with two day employees, or 21 tons per day-man per day.
2. Averaged 365 tons per day for one year with 16 day employees, or 22.7 tons per day-man per day.
3. Averaged 429 tons per day for one year with 17 day employees, or 25 tons per day-man per day.
4. Averaged 218 tons per day for one year with eight day employees, or 27.2 tons per day-man per day.
5. Averaged 131 tons per day for one year with five day employees, or 26.2 tons per day-man per day.

The average of these is 24.4 tons per day-man per day, and these mines were selected for their unusually efficient operation. There are very few of them in the list of 454 mines, and they are given to show that this grade of efficiency has been reached by the willingness of the employees. The aggregate production and the number of day-men employed at all of the 454 mines show their average efficiency to be 11.4 tons per day-man per day. These figures and the following tabulation include all the employees inside and outside the mine:

	Tons per Day-Man per Day	Cost per ton (Labor Averaged at $2.20 per Day)
Five mines	24.4	$0.0902
454 mines	11.4	0.1930

In the 454 mines the labor work cost 10.28c. per ton more than it ought to have cost on a fair valuation.

Although I started out under an imaginary hypothesis the evidence that is brought to bear upon the subject points toward its realization in some cases. The saving of 10.28c. per ton is a minimum, as many of the 454 mines are operated with a very efficient force of men, and they include the five mines.

Looking at the question from another point of view, we have:

	Tons per Day-Man per Day	Cost per Ton (Labor Averaged at $2.20 per Day)	Saving
64 efficient pick mines	16.76	$0.1313	
100 inefficient pick mines	9.66	0.2277	$0.0964
139 efficient machine mines	13.44	0.1637	
151 inefficient machine mines	8.29	0.2654	0.1017

The average of the saving in these two classes of mines is 9.90c. per ton, which is practically the same result obtained before.

---

*Flemington, W. Va.

Another interesting observation is the fact that in mines approaching labor troubles there is invariably a low efficiency, while in mines where these troubles are not active and peace reigns we find the best production per day-man. Again the 10c. per ton saving must be a minimum, as all the mines are included in the averages and a great many just border on the line drawn between efficient and inefficient. If only the extremes were taken, the saving would run close to 20c. per ton. This variation can only be due to one or more of the following reasons: 1. Natural mining difficulties. 2. Plant deficiencies. 3. Inefficiency in day labor.

Waste of Labor Due to a Lack of Desire

I have had intimate knowledge of plants operating under many natural difficulties with a day force as economical as any of the averages above quoted; also, I am acquainted with mines having many natural advantages and yet running with a day force capable of handling double the tonnage that is now obtained. A long driver's haul, a poorly located motor sidetrack, a bad roof or dip workings are expensive difficulties, but it is almost impossible for them to have any material effect on the average of so many mines under such able management.

Fundamental contentment and happiness produce an effect on the miners themselves; a less number are required for the same tonnage, fewer working places are needed, less extensive mine tracks are required, and a more compact organization results. This all tends to effect an additional saving.

Twenty per cent. of the supply and material expense at a mine may be eliminated if all the employees have the interests of their employers at heart. The detective and guard systems may be abandoned. Full efficiency can never be realized until there is the inherent desire among all employees; its essential part is goodwill from the management down to the lowliest trapper. If followed energetically the idea here discussed will work to the mutual advantage of both employer and employee.

⁂

How One Company Solved the Question of Credits

That the operator often complains of the slowness with which many retail coal dealers pay their bills is well known to the creditman. There are large retail dealers who discount bills, and there are some small ones too; but the retail dealer frequently is slow and loses not only the advantage of discounts and favorable prices, but also suffers when suffering is needless.

A study of retailers' methods might throw some light on the situation that would be surprising. Not long ago a retail dealer in a Middle-Western city added two large automobile trucks to his delivery equipment. These trucks were larger than any he had used previously and reduced the cost of delivering several cents a ton, but he placed the few cents saved at the bottom of his footings. He even remarked that he could go back to the old wagon, scoop shovel and day labor and make a profit. Why?

That question was promptly asked, and credits was the reply. The credit-man of that company refuses to accept an account just because an order has been given. He asks many questions, calls for credit reports and then passes upon the financial standing of the prospective customer.

Two classes of accounts are not accepted on credit: First is the boarding- or rooming-house customer. Experience in a large city has shown that these consumers are likely to move, have very little ready capital as a rule and are without assets. A few who own property and have proven their ability to pay their bills promptly may be allowed a limited line of credit. But when they are, they are not in the class known as boarding-house or rooming-house proprietors.

The second class of poor credit is the apartment house. Though large consumers of coal, the responsibility of the average owner is small. In the first place the buildings are almost without exception heavily mortgaged. Frequently a second mortgage stands against the property, and the income is held to satisfy the second mortgage. Another serious feature is the speculation that develops in the real-estate business. The buildings are frequently sold, and the owner, having obtained his money, is not interested in old bills. The new owners dodge the bills by referring the collector to the former owner.

The known deadbeat is never given credit, and the man who owns large property, but lets his bills run four to six months, is promptly checked off the books of this company.

Limited credit is extended to home-owners who are paying for property on the monthly-payment plan. It has been found by experience that those who have bought homes with a few hundred dollars to pay down and are paying off the balance on monthly payments against land contracts will let every bill go rather than fall in arrears on their home-purchase payments.

Credit not to exceed 60 days is allowed any customer, and those who do not pay their bills within 30 days are not given large lines of credit.

Refuses Credit on Small Orders

This particular coal dealer makes it a rule to refuse a customer credit on orders for half a ton and a ton, unless the order is from an old customer of approved credit. Fully 50 per cent. of the retail coal business in a large city is half-ton and ton trade, and the smallness of the accounts makes collecting and losses such a large expense that there is no profit left.

The company that follows this strict plan of extending credit has grown from a single horse-and-wagon business to the largest trade in northern Ohio. The success of the venture has been in proportion to the extreme care exercised in extending credit. For one customer who is lost through careful inquiry into his paying quality and ability two have been gained. The company tries to purchase the best quality of coal it is possible to get, pays for it at discount terms and carefully grades prepared sizes in its own yards, and the trade appreciates the advantages thus obtained.

The credit-man takes the view that it is just as proper to require statements from retail customers as it is for the wholesale dealer to make inquiry of the large buyer. This is explained to the customer seeking credit, and except to those who are unable to stand investigation it seldom proves offensive. The system has been so carefully worked out that the retail business of the company is considered and has been proved less hazardous than its wholesale trade.

The Coal Fields of West Virginia

By J. S. Burrows*

SYNOPSIS—Description of the coal fields of West Virginia, showing the location of the important districts and the geology of the coal-bearing measures. A brief sketch of the commercial importance of the different seams is given and the principal railroads in the various districts.

Coal mining is by far the most important industry in West Virginia and in fact the only industry in that state in which any considerable proportion of the population is engaged. Out of a total area of slightly more than 24,000 sq.mi., 17,000, or more than 70 per cent. of the state, lies in the coal fields which form a part of the Appalachian region. Among the coal-producing states of the country, West Virginia now holds second place, having contested this position (next to Pennsylvania) with Illinois for a number of years. As the last of the important coal-producing states to open and develop its coal resources, West Virginia's rapid advance is truly remarkable. While a large proportion of Pennsylvania and Illinois coal is used within the borders of these states, almost the entire

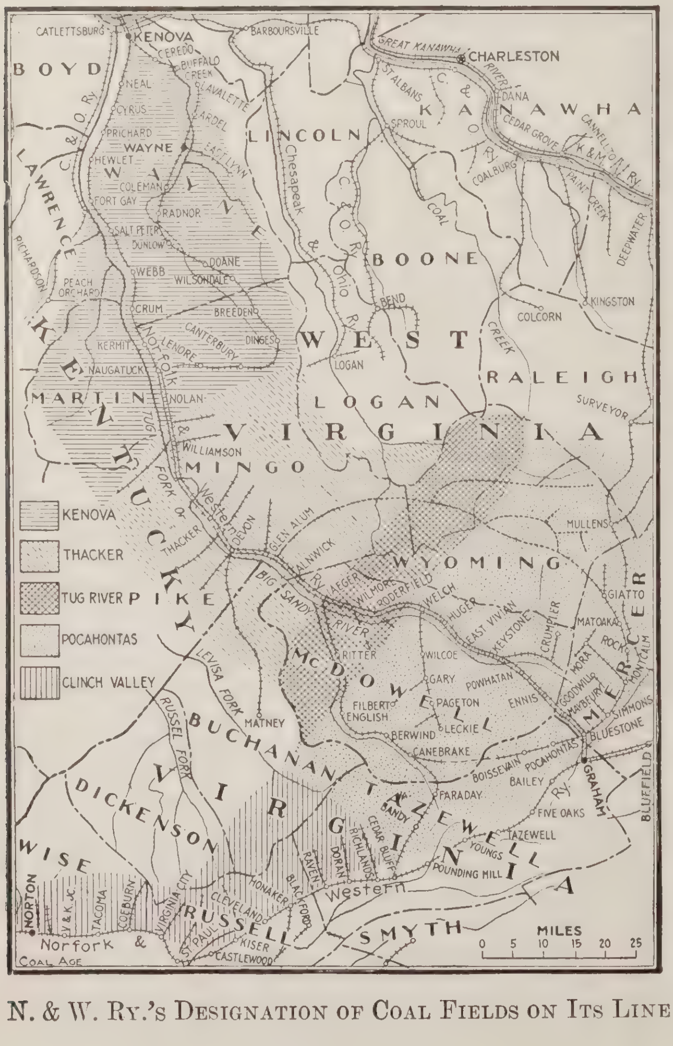
The Bituminous Coalbeds of West Virginia

Index No.	System	Series	FORMATIONS	NAMES OF COAL BEDS	LOCAL NAMES OF COAL BEDS	COMMERCIAL VALUE AND IMPORTANCE
1	(Upper) Carboniferous	Permian	Dunkard XVI	Windy Gap		No commercial value but of interest as the highest known coal, geologically, of the Appalachian field. Found near Belltown, Marshall Co.
2				Gilmore		No commercial value.
3				Ninevah		No commercial value.
4				Hostetter		No commercial value.
5				Fish Creek		No commercial value.
6				Dunkard		No commercial value.
7				Jollytown		No commercial value.
8				Hundred		No commercial value.
9				Washington A		No commercial value.
10				Washington	Hobson, Chestnut Oak coal, Hickory coal.	The only coal bed of this formation with any possible but doubtful value. No present commercial value.
11				Little Washington		No commercial value.
12				Waynesburg B		No commercial value.
13				Waynesburg A		No commercial value.
14		Pennsylvanian	Monongahela (Upper Productive) XV	Waynesburg		Dirty coal of doubtful value, mined for local use.
15				Little Waynesburg		No commercial value.
16				Uniontown		No commercial value.
17				Sewickley	Mapletown	Valuable along Monongahela River and Marion counties and mined for shipment to a small extent.
18				Redstone	Century coal.	High-volatile coal widely distributed south of the Fairmont region and mined to a considerable extent in the vicinity of Century.
19				Pittsburg	Fairmont coal, Clarksburg coal.	One of the most valuable coal beds in the United States occupying a large area in the northern part of the state where it is extensively mined in the Fairmont district and yields both high grade gas and coking coal.
20			Conemaugh (Lower Barren) XIV	Little Pittsburg		No commercial value.
21				Elk Lick	Threefoot bed, Jacksonville coal.	Mined to some extent on the C. & C. R. R. and on the Maryland side of the Upper Potomac region but generally of little value.
22				Harlem	Friendsville, Crinoidal	No commercial value.
23				Bakerstown	Fourfoot coal	Mined to some extent in Upper Potomac Region.
24				Brush Creek (Mahoning)		No commercial value; mined for local use.
25			Allegheny (Lower Productive) XIII	Upper Freeport		Of value only in northern counties. It is mined to some extent in the Upper Potomac district, where it yields a semi-bituminous coal and along the Morgantown & Kingwood R.R. as well as along the C. & C. R. R. where it yields medium and high-volatile coal.
26				Lower Freeport	Roger Vein	Found in the northern counties but of little or no commercial value except in the Panhandle where it is mined to some extent.
27				Upper Kittanning	Mahoning coal	Irregular coal of comparatively little commercial value mined for local use in northern part of the state where it is of the high-volatile type.
28				Middle Kittanning		No commercial value.
29				Lower Kittanning	Davis coal, Roaring Creek coal, North Coalburg coal, No. 5 Block coal, Mason coal.	One of the important coals of this state. Widely persistent throughout coalfields. Very extensively mined in northern part of the state where it yields a large tonnage of semi-bituminous coal in the Upper Potomac district, and high-volatile coal in the Roaring Creek district and vicinity. It has been traced southward as far as the Kanawha district where as the No. 5 Block it supplies considerable tonnage.
30				Clarion		No commercial value unless the No. 5 Block should prove to be at this horizon.
				Brookville (Possibly No. 5 Block)		
31			Upper Pottsville Kanawha Group	Stockton-Lewiston	Big bed of Mingo and Logan Counties	High-volatile bed of wide persistence in and to the northward of the Kanawha district. It has also been identified in the Thacker district and is mined on a commercial scale in both regions. Locally it yields a good cannel coal.
32				Coalburg	Twin seam; Buffalo Creek bed of Mingo Co.	One of the valuable coals of the Kanawha series. Extensively mined in the Kanawha district and although mined to a less extent in the Thacker district where it is sometimes known as the Buffalo Creek coal, it is also of great commercial importance there. This coal is of the high-volatile type and yields both gas and splint coal.
33				Winifrede	Black band coal	One of the most valuable beds of the Kanawha and Thacker districts. It has been mined for years in the former and is being extensively developed in the latter district. It is a high-volatile bed and yields a large tonnage of high grade splint coal.
34				Chilton		Irregular impure bed in the Kanawha district and of no commercial value.
35				Thacker (Possibly Cedar Grove)		The most important coal of the Thacker district, where it is mined on a large scale. It is a high-volatile coal and yields some splint.
36				Cedar Grove		Thin (high-volatile) coal mined to some extent in the Kanawha district and locally the source of high grade cannel coal. The Thacker coal may belong to this horizon.
37				Peerless	Alma in Thacker District	Comparatively unimportant high-volatile bed in the Kanawha district but as the Alma coal (provisional correlation) of the Thacker district it has considerable value.
38				No. 2 Gas	Island Creek coal in Logan Co.; Ansted in Fayette county; Warfield and Rawl coal in Thacker district.	The most widely distributed and important coal of the Kanawha series. Stands first in production in the Kanawha district and as the Warfield coal (provisional correlation) is extensively mined in the Thacker district. It is generally high-volatile in character but locally of the medium-volatile type and yields both gas and splint coal with occasionally some cannel.
39				Powellton		High-volatile bed somewhat extensively mined in the Kanawha district to which its workable area is practically confined.
40				Eagle		One of the important coals of the Kanawha series mined at a number of places in the Kanawha district and probably in the Thacker district where the Upper War Eagle may prove to be at this horizon. A typical high-volatile coal.
41				Little Eagle		Thin (medium-volatile) bed found in the Kanawha district, but not mined at present on a commercial scale.
42				Upper War Eagle (Probably Eagle)	War Eagle No. 2; Coking seam in Wyoming Co.	Medium and high-volatile bed. Mined somewhat extensively in Thacker district and locally in Wyoming County.
43				Middle War Eagle	War Eagle No. 1; Middle Warfield	Medium and high-volatile coal. Mined somewhat extensively in vicinity of Alnwick Thacker district and found also in Raleigh and southern Fayette County.
44				Lower War Eagle	War Eagle No. 0	Thin semi-bituminous bed found on southern margin of New River-Pocahontas districts and not mined on a commercial scale.

(Table continued on following page)

THE BITUMINOUS COAL BEDS OF WEST VIRGINIA—(Continued)

Index No.	System	Series	FORMATIONS		NAME OF COAL BEDS	LOCAL NAMES OF COAL BEDS	COMMERCIAL VALUE AND IMPORTANCE
45	(Upper) Carboniferous	Pennsylvanian	Lower Pottsville	New River Group	Hughes Ferry (Sharon Coal horizon)		No commercial value. Persistent over southern Nicholas and western Greenbrier County.
46					Iaeger		Thin dirty semi-bituminous coal. Possibly a split from the Sewell coal. Known area limited to Tug River district in the vicinity of the town of Iaeger, where it is mined to some extent.
47					Sewell	Davy, in Tug River district	The most extensively developed of the three important semi-bituminous beds of the New River district where it has held first place in production for many years. The Davy coal of the Tug River district is believed to represent the Sewell coal in McDowell County where it is extensively mined over a small area and yields an exceptionally pure soft coal which is used principally for by-product coke purposes.
48					Welch	Tug River seam; Hemphill; Lambert.	Provisionally considered a distinct bed. May be part of Sewell above. Found in McDowell County where it is semi-bituminous in character and where it is extensively mined in the Tug River district.
49					Beckley	War Creek in Tug River District; Whitestick.	One of the three valuable semi-bituminous beds of the New River district. The newest mining operations are in this bed, large areas having been made accessible in Raleigh County through the building of the Virginian Railway, on which the principal operations are located many of which also have a C. & O. Ry. connection. This bed is destined to take first place in the production of New River coal.
50					Fire Creek (Quinnimont)		The lowest of the three valuable semi-bituminous beds of the New River field. The first bed to be mined along New River and for many years the premier seam of this region. Partial exhaustion has relegated it to third place in production. Principal operations are on the C. & O. Ry. in the New River district.
51					Little Fire Creek		No commercial value.
52				Pocahontas Group	Pocahontas No. 6		Small areas of semi-bituminous coal of considerable value in McDowell County where at present it is occasionally mined on a small scale.
53					Pocahontas No. 5		Limited areas of semi-bituminous coal in McDowell County, not mined at present but has a possible future value.
54					Pocahontas No. 4	Thin Vein Pocahontas	Second in importance to the Pocahontas No. 3 coal and now mined extensively in the western end of the Pocahontas district and in the Tug River district with important undeveloped areas of good semi-bituminous coal in Raleigh, Wyoming, McDowell, and Mercer counties.
55					Pocahontas No. 3	Pocahontas Thick Vein Pocahontas Flat Top	One of the most valuable coal beds in the United States and the source of the well-known brands of Pocahontas semi-bituminous coal. The present operations in this bed are confined almost exclusively to the Pocahontas district of the N. & W. Ry. The workable areas are confined within Mercer, Raleigh, Wyoming and McDowell counties with a small adjoining area in Tazewell County, Virginia.
56					Pocahontas No. 2		Thin coal of no commercial value.
57					Pocahontas No. 1		Thin coal of no commercial value.



N. & W. Ry.'s Designation of Coal Fields on Its Line

output of West Virginia is shipped to markets beyond the state's boundaries and is used in a larger territory than the coal of any other state in the country.

The principal mining districts are shown in the accompanying table, which gives particulars as to kind of coal, railroads, etc. The index of important coals being mined in each district refers to the table of coal beds; as will be seen, this gives a complete list of all the coals recognized in the state, arranged in their geological sequence from the lowest to the highest. The arrangement of this table is the same as those I prepared for the states of Pennsylvania and Ohio, which have already appeared in Coal Age.

Of special geological interest in the West Virginia coal measures is the importance of the Pottsville formation. While this formation is of little or no commercial value as a coal-bearing horizon in Ohio and Pennsylvania, in West Virginia it carries the most important seams of the state and is probably the most valuable coal-bearing horizon in the United States if not in the world.

* * *

Recovery of Excessive Freight Charges—Suit cannot be maintained in a state court to recover against a railway company on the theory that freight charges collected on interstate shipments were excessive, if the rates charged conformed to published tariffs, and no order for a refund or reparation has been made by the Interstate Commerce Commission. (Nebraska Supreme Court, F. A. Foster Lumber Co. vs. Union Pacific R.R. Co., 151 Northwestern Reporter 168.)

* * *

Statutory Safety Requirement not Controlled by Custom—The requirement of the Kentucky Mining Law that miners select their own caps and props and mark them, cannot be controlled by a custom to the contrary in a particular mine, so as to charge the operator with liability for death of a miner in a suit based on claimed failure of the operator to furnish caps and props under a custom requiring the foreman to furnish them on mere request. (Kentucky Court of Appeals, Palmer's Administratrix vs. Empire Coal Co., 172 Southwestern Reporter 97.)

The Successful Use of the Chain Grate Stoker

By T. A. Marsh*

SYNOPSIS—For many years the use of the chain grate stoker was confined to the high-volatile, high-moisture, and high-ash but noncoking coals of the West and Middle West. More recently a type of this machine has been devised which successfully handles the low-ash coking coals of the East.

The type of stoker most extensively used in the districts tributary to the bituminous coal fields of the West is the chain grate, and the extensive development of this machine has been made in the Middle West where the free-burning bituminous coals are obtained.

An average analysis of the free-burning bituminous coal of the Middle West is as follows:

Moisture	5 per cent.
Volatile matter	30 per cent.
Fixed carbon	55 per cent.
Ash	10 per cent.
B.t.u. per lb. of dry coal	12,000

On account of the simplicity of operation, low maintenance and particularly the ability to obtain high efficiency in operation, this type of stoker has become more and more widely used until the Green Engineering Co. alone has over two million horsepower in service.

The successful results so generally obtained caused the demand for chain grates to broaden, and the ability to burn the semibituminous coking coals of the East, and also the high-ash and high-moisture coals of the West, has become a very important matter.

Previous to three years ago, the chain grate was considered absolutely inapplicable to the coking coals of the Eastern seaboard, and the Green Engineering Co. did not attempt to place its standard chain grate stoker in any locality which involved the use of a coking fuel. The characteristics of such a coal and its action when subjected to heat make it impossible to uniformly ignite, coke and consume this fuel unless it is treated by auxiliary means to an extent which the standard chain grate does not and cannot provide.

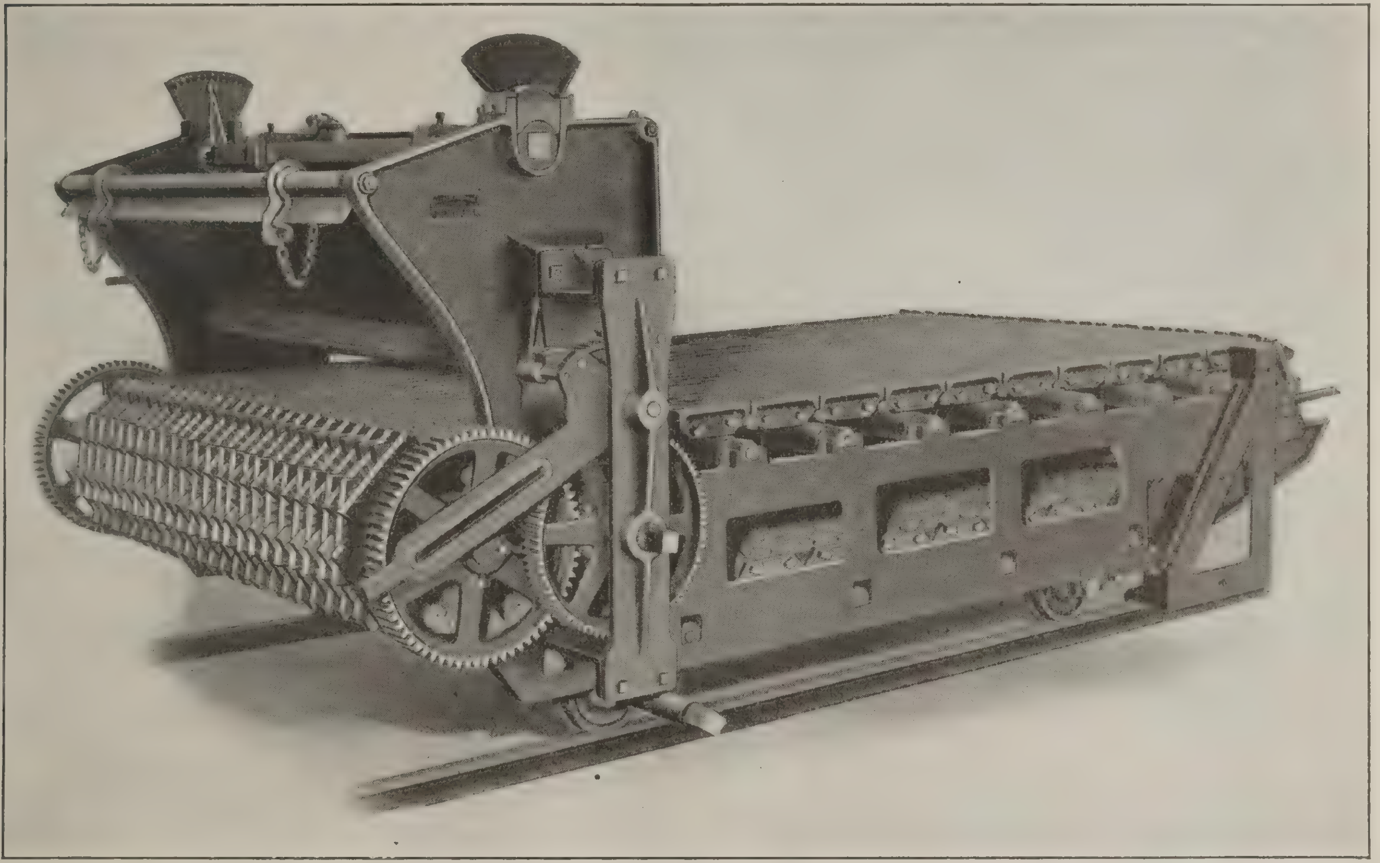


Fig. 1. A Standard Green Chain Grate Stoker Removed from the Boiler Furnace

Increase in the draft only serves to accentuate the difficulties which are found to be present in such cases, causing holes to develop in the fuel bed, permitting a marked short-circuiting of the free air and seriously diluting the furnace gases. Even though the fuel can be successfully ignited, it has a tendency to draw together into solid masses of coke which burn only on the surface. These masses will then remain almost indefinitely as coke and either form an undesirable accumulation at the bridgewall or pass into the ashpit unconsumed.

In addition to this unavoidable characteristic of this fuel, it forms a practically impervious layer near the front of the stoker and does not permit of the passage of air under the influence of the furnace draft. It is, therefore, most difficult to ignite if undisturbed and almost equally difficult to consume even if the ignition is successful and the draft sufficient to furnish oxygen.

---

*Chief engineer, Green Engineering Co., 28 East Jackson St., Chicago.

The Eastern coals do not as a rule carry much ash, but the intensity of the heat which results from the combustion of clean fuel is such that the impurities contained readily melt in the furnace, and those types of stokers which disturb the general formation of the fuel bed inevitably produce clinkers by the fusing of the ash. There is but one proper method of burning bituminous coal and that is to allow it to remain quiet during the latter stages of combustion. Ash is naturally formed first at the grate surface where the oxygen supply is greatest and where the combustion is therefore earliest completed. An inversion of the fuel bed brings this ash layer to the surface with the incandescent carbon below, and the fluxing of the ash is inevitable. There is no getting away from the fact that this action is objectionable to an extreme degree, it being the primary cause of both the brick and metal deterioration in the furnace of the stoker which inverts or mixes the fuel.

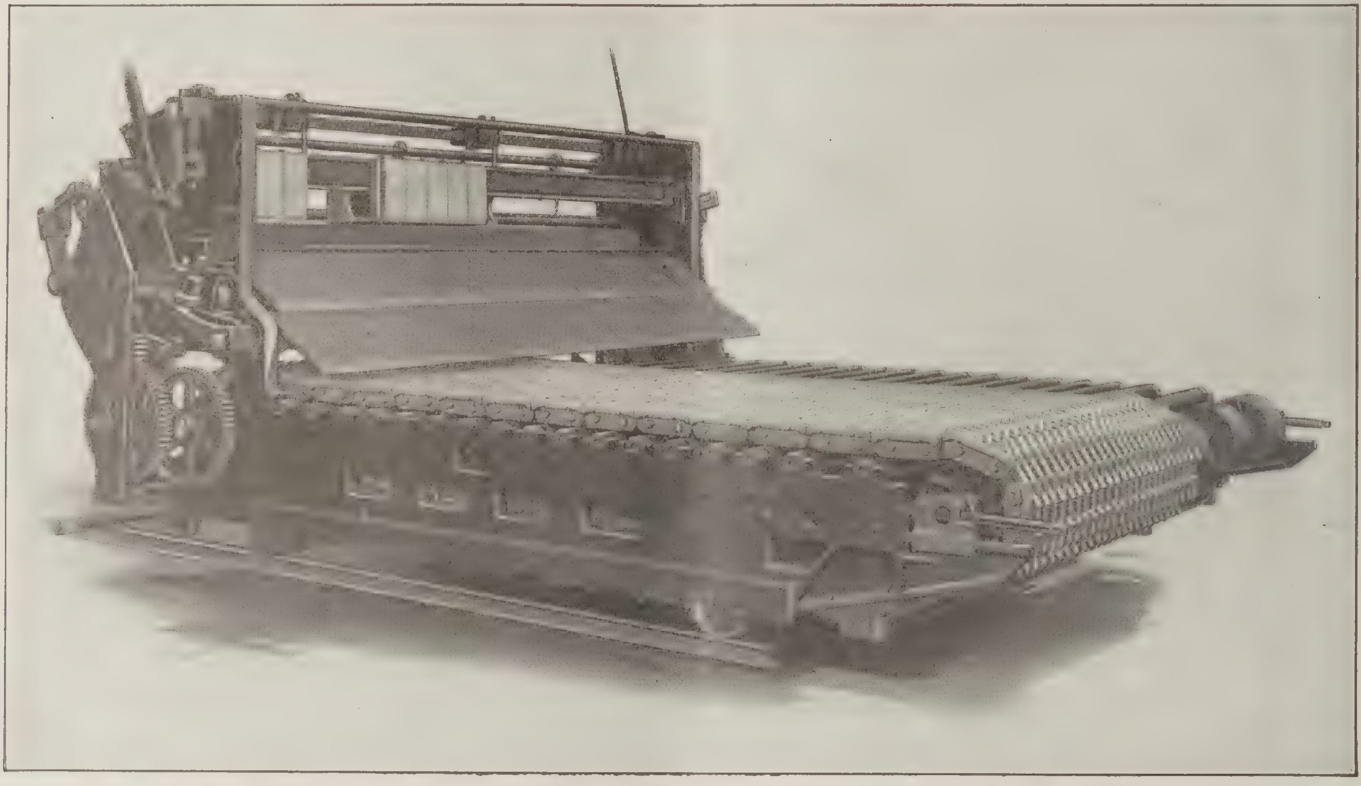

Fig. 2. The "L" Type of Chain Grate Stoker, Showing the Oscillating Inclined Coking Plates at Front End

Two Combustion Zones Are Provided

The "L" type of chain grate stoker manufactured by the Green Engineering Co. provides for two distinct zones in the combustion process—the first being for the distillation and ignition of the combustible volatiles; the second for the combustion of fixed carbon. The inclined coking plates, over which the fuel flows in its descent from the hopper to the chain grate surface, are agitated to a sufficient extent to keep the fuel particles in constant motion relative to one another. The binding substance which exudes from the particles of coal is thus not permitted to "set" so as to cement such particles together.

The length of the incline and the extent of its agitation are sufficient to provide for the complete distillation of the combustible volatiles. This precludes further caking of the material and produces a resultant fuel bed in the form of uniform coke of comparatively small size. The fragmentary and porous nature of such a fuel bed in turn permits the carrying of unusually thick fires and the nearly complete extraction of the oxygen from the entering air.

With this arrangement it is quite possible to develop 14 to 16 per cent. of CO_2 in the furnace gases under conditions of commercial operation.

The efficient burning of high-ash and of high-moisture coals is entirely a question of furnace proportions and design, and the individual fuels must be studied and treated on the basis of experience.

It is not generally known that the lignites of Colorado as well as the coals of Texas that contain more than 25 per cent. of moisture can be burned with excellent results. Figures given below are from actual tests and were obtained in plants burning these fuels regularly. These figures can be depended upon as reliable.

TEST NO. 1

Fuel—Colorado lignite.	
Fuel analysis—	
Moisture	23.73 per cent.
Volatile matter	33.23 per cent.
Fixed carbon	35.25 per cent.
Ash	7.79 per cent.
B.t.u. per lb. dry	11,160
B.t.u. per lb. as fired	8,520
Type of boiler—Babcock & Wilcox.	
Type of stoker—Green chain grate.	
Horsepower of boiler	400
Grate surface	103 sq.ft.
Pounds of coal burned per square foot of grate surface per hour	28
Horsepower developed	512
CO_2 at damper	12.1 per cent.
Combined efficiency of boiler and furnace	69.7 per cent.

TEST NO. 2

Fuel—Texas lignite.	
Fuel analysis—	
Moisture	29.8 per cent.
Volatile matter	31.34 per cent.
Fixed carbon	25.71 per cent.
Ash	13.15 per cent.
B.t.u. per lb. of coal dry	9,838
B.t.u. per lb. of coal as fired	6,906
Type of boiler—Babcock & Wilcox.	
Type of stoker—Green chain grate.	
Horsepower of boiler	600
Grate surface	132.5 sq.ft.
Pounds of coal burned per square foot of grate surface per hour	31.6
Horsepower developed	586
CO_2 at damper	12.2 per cent.
Combined efficiency of boiler and furnace	68 per cent.

TEST NO. 3

Fuel—Texas lignite.	
Fuel analysis—	
Moisture	30.93 per cent.
Volatile matter	30.96 per cent.
Fixed carbon	26.45 per cent.
Ash	11.66 per cent.
B.t.u. per lb. of coal dry	10,314
B.t.u. per lb.of coal as fired	7,124
Type of boiler—Babcock & Wilcox.	
Type of stoker—Green chain grate.	
Horsepower of boiler	600
Grate surface	132.5 sq.ft.
Pounds of coal burned per square foot of grate surface per hour	30.6
Horsepower developed	615
CO_2 at damper	11.3 per cent.
Combined efficiency of boiler and furnace	71.3 per cent.

Coals which contain a high percentage of ash require a materially different design of furnace from low-ash fuels, but in both cases the grate surface should be large and the igniting arch ample. Some results from high-ash coal from Texas and Arkansas are given below, indicating that with proper furnace design and proportions excellent results can be obtained. It should be noted that in all of these tests both the CO_2 and the boiler efficiency are fairly high.

TEST NO. 4

Fuel—Arkansas semibituminous.	
Fuel analysis—	
Moisture	3.74 per cent.
Volatile matter	14.71 per cent.
Fixed carbon	57.08 per cent.
Ash	24.47 per cent.
B.t.u. per lb. of coal dry	11,190
B.t.u. per lb. of coal as fired	10,771
Type of boiler—Babcock & Wilcox.	
Type of stoker—Green chain grate.	
Horsepower of boiler	600
Grate surface	132.5 sq.ft.
Pounds of coal burned per square foot of grate surface per hour	20.52
Horsepower developed	641
CO_2 at damper	11.6 per cent.
Combined efficiency of boiler and furnace	73.3 per cent.

TEST NO. 5

Fuel—Arkansas semibituminous.	
Fuel analysis—	
Moisture	1.77 per cent.
Volatile matter	15.91 per cent.
Fixed carbon	53.78 per cent.
Ash	28.54 per cent.
B.t.u. per lb. of coal dry	10,537
B.t.u. per lb.of coal as fired	10,351
Type of boiler—Babcock & Wilcox.	
Type of stoker—Green chain grate.	
Horsepower of boiler	600
Grate surface	132.5 sq.ft.
Pounds of coal burned per square foot of grate surface per hour	25.6
Horsepower developed	743
CO_2 at damper	11 per cent.
Combined efficiency of boiler and furnace	71.1 per cent.

TEST NO. 6

Fuel—Texas bituminous.	
Fuel analysis—	
Moisture	4.48 per cent.
Volatile matter	33.48 per cent.
Fixed carbon	35.38 per cent.
Ash	26.76 per cent.
B.t.u. per lb. of coal dry	10,255
B.t.u. per lb.of coal as fired	9,796
Type of boiler—Babcock & Wilcox.	
Type of stoker—Green chain grate.	
Horsepower of boiler	500
Grate surface	137
Pounds of coal burned per square foot of grate surface per hour	27.87
Horsepower developed	724
CO_2 at damper	10.6 per cent.
Combined efficiency of boiler and furnace	66 per cent.

Efficiency as Applied to Mining

By Hugh Archbald*

SYNOPSIS—The basis of efficiency work, which is the increasing of the amount of work of the individual and the proper arrangement of that work, is as applicable to mining as to manufacturing. The means used for accomplishing this is by keeping simple records and timing the details of each operation.

Gantt, in the opening sentence of his work entitled, "Work, Wages and Profits," makes the statement that "the greatest problem before engineers and managers today is the economical utilization of labor."

The greatest waste in mining is the waste of time. The proper balance between the efforts of each workman is not maintained, so that all suffer under unnecessary delays. As an instance a tracklayer may be sent to fix a certain piece of track without any definite instructions based on investigation as to how much work needs to be done and how long it is going to take. The result is that the man starts for his work and finds that someone has taken the rail-bender. He may first have to find out who took it. Then he must find that man to learn where he left it. Then he must get the rail-bender to the place where he is going to use it. Then he finds that he will need some ties; so he must hunt around for them and wait for a trip to get them to the place to be fixed. Finally after much wandering around he can get to work. A mine is a friendly place and one can get into a conversation at any time; so any man wandering around will stop often to chat. If he is being paid by the day, all these talks are at the expense of the company.

It is part of the duties of the supervisory force of a mine to see that the material needed on any job is at the place where it is to be used before the workman is sent to do it. Yet too often scorn is expressed for the workman who cannot do all his own planning. A separation should be made between the investigation of and the planning for the things that need to be done and the actual doing of them. No man should be turned loose in a mine to work out his own salvation. It is probable that the high rates which exist generally for piece-work in mines are due to this attitude of turning a man loose, combined with the attitude that as soon as a price is fixed for any piece of work it does not concern the interest of the company to help the man earn his living. On the contrary it is to the interest of the company just as much as seeing that a day's work is done for a day's pay. It is part of the organization of work.

COSTS MAY BE REDUCED

It is rather a delicate matter to suggest to any man that the organization which he has for accomplishing work is not the best. He is likely to be offended. And yet it is a fact that costs can be reduced and outputs increased in many places merely by putting into effect a better organization. It is a problem that has been successfully attacked in the manufacturing field by Taylor, Emerson and other leaders. Sooner or later the problem will be taken up as generally in mining as it now is in manufacturing, and the same results will be obtained.

---

*Mining engineer, Scranton, Penn.

Many kinds of machines are manufactured and offered for sale, each one differing in some way from the others. The consequence is that much is written about machines, and they are the subject of many discussions. In contrast, organizations are not for sale, are not easily transportable and have not as great a variety.

The proper equipment of a mine is of primary importance. Work cannot be done without tools. And it is not to be recommended that supplies should be ordered without discussion and due consideration. But the material cost for mining coal is one-fifth or less of the labor cost, and yet it seems often as if it received *the majority of the attention*. There seems to be an idea, not alone in mining but in other lines of work, that men can be employed almost without limit and the work turned out in proportion to the number employed. It is not so; there is a certain balance between the number of men and the equipment even in the simplest of mines.

At one mine the number of loaders employed was reduced about 50, and yet the tonnage was increased 300 tons a day. Before that, the cars had been spread so thin over the number of men that the company had not been getting the full number of cars for a day's work. And when a limited number of cars is spread over too large an area, there is a loss in the efficiency of the transportation units. At another mine where it was desired to increase the daily tonnage over the 600 tons a day which *were being* mined, advertisements were run in the papers for loaders. On counting up the number of loaders, it was found that over 170 were already employed and that they were not getting enough cars to load to be able to earn a day's wage. The reason for the inability to increase the tonnage lay in a different direction from the number employed.

The simplest proposition in mining is that where the miner either digs and shoots the coal or, blasting it from the solid, loads it into the mine car himself, and where the car is taken by mule power over a short haul to the tipple. In this case as there are only two classes of work and so only one point of contact between classes, there is only one point that needs constant supervision—that between the miners and the driver to maintain the proper balance of work. Moreover, the miner has more than one thing to do. When he is not loading coal, he is getting coal ready to load, so that delays on the part of one set of men are not as important as where a greater subdivision of work exists.

It may seem like stating things with which everyone is familiar to call attention to some of the things in mining, but the true significance of some of the relations is not appreciated.

Work Must Be Planned

Efficiency work means the following up of each man and the arrangement of work so that each man can do his best. Under it, the management is expected to know all that goes on. The recommendation which was given for a track-layer—that all that was needed was to give him a job and he would find his work—does not prevail in efficiency work. That track-layer may have been exceptional, but for the ordinary man the work must be planned out.

When machinery is used to cut the coal, three elements are introduced, and even more than three, so that the supervision is not so easy a matter. With undercutting machinery it is necessary to watch that the haulage and the undercutting and the loading come out even in order to get good results. In this case there is more than one point of contact, as the number of classes of work is increased.

With pick coal mining, a miner can dig coal while the cars are being changed. With machine mining, the loader must lie idle between cars. Therefore it is best to have the cars changed quickly, for idleness breeds idleness. When there is a long time between cars and the men have to sit in the cold, moist air of the mine, they get stiffened up and do not load fast nor pitch into their work with vim.

It is a fact that where men have plenty to do they work better than where they do not have enough. One morning in a mine I passed two men playing checkers while four others sat around wrapped up in their overcoats, watching them. The mine foreman, who was along with me, commented after we had passed them upon the fact that it was easier to get men to load coal on another road in that mine where the men got more cars than on this road. On the other road the men would fight over cars and come in early in the morning and stay late at night loading coal, while on this road the opposite was true, the men going home as soon as they had loaded one or maybe two cars. In support of this remark, he told me that a few days before he had found two loaders fighting over a car, one of the men asserting his right to the car because, as he said to the other, "You had 13 cars yesterday and we had only 12." The men on the other roads were only getting twos and threes.

It is a result to be expected, for it takes a man about 20 min. to load one ton of loose coal. If he loads four tons in a day, he would only be loading 80 min. He might have to stand three props for these four tons. With split props in a 4-ft. vein it takes hardly 5 min., more likely 3 min., to stand one, so that the man might work 95 min. in a day. That would leave 385 min. in an 8-hour day for a man to loaf around doing nothing. If there is bottom to take up or roof to take down to make height for a car, this loafing time might be reduced by 30 min. at a maximum, but that would leave 355 min., nearly 6 hours out of the 8 that the man is supposed to work.

When a man has to loaf that long, it is no wonder that he goes home as soon as he feels inclined. It is not good for the man. It is not good for the company.

There is the assumption in this calculation that the man can load the coal directly into the car without turning it over. It is best to have the rooms of such width that this can be done. There is always the question, too, of how much a man can do. The answer is generally given on a guess without any study of what actually is being done. One foreman guessed that at his mine one could hardly expect a man to load more than 4 tons of pick coal in a day. On examination it was found that 60 per cent. of his men were loading 4½ tons or better.

Just as the place to begin the cleaning up of a mine is at the face of the workings, in order that all that is gathered may travel always toward the pit-mouth, so, too, the place to begin efficiency work is at the face. The essentials of mining are two things—shoveling and transportation. If there is no shoveling done, there will be no transportation; so the problem to tackle first is shoveling.

If there is any coal loaded into mine cars by machines, it is so small at present that it can be neglected. All coal is practically loaded by hand. The size and the shape of the shovel used by the men are subjects for consideration in efficiency work. At a mine where an attempt was being made to work a seam 27 in. in height and irregular to boot, all the men were paid by the day, the shovels being supplied by the company. No. 1 and No. 2 flat coal shovels were used, but as these seemed to have too long a handle to be convenient, a few shovels were specially obtained with a very short handle, one where the D-shaped part began almost at the end of the iron. In every other respect the shovel was the same. But these shovels did not work well, and so a return was made to the long-handled shovels that were first used.

The trouble was not in the length of the handle, but in the shape of the whole shovel. A man uses with difficulty a shovel in which the space between his hands is less than his shoulder width—preferably a little greater, about 22 in. What was needed in a low vein such as this, where it is hard for a man to crowd himself in and where he would have to shovel with the blade vertical, was a scoop-shaped shovel having a low lift and a quick rise from the blade to the handle, so that the man could get his hand near to the load. The shovel that was being supplied had all the faults it could possibly possess. With a scoop, the men could pitch the coal about 12 ft. as against 9 ft. with the flat coal shovel—a gain in shoveling efficiency.

* In fourth left heading.

Men Should Be Treated as Individuals

There is one idea to be got rid of in starting efficiency work, and that is the consideration of the workmen as a mass. When one goes to a mine and begins to ask questions, the answers are often in the form "the men this" and "the men that," without specifying which particular men. The men in the mine should be treated as individuals, and after records have been made of the work of each one, sum totals showing the whole work can be made. The results will often be different from the guesses upon which the work had been proceeding.

As an example of the kind of records which can be made, Table 1 is given, which is the record of one heading in a mine for a period of two weeks. At this mine, which is a bituminous mine, with a seam of coal about 4 ft. in height, the men are paid by the ton. In the first column is given the number of the loader. Opposite each number is recorded the number of cars which were dumped over the tipple on each day in the two weeks. In the total columns are given first the total number of cars for the two weeks and beside them the total tons. The next column gives the average cars per day; it is merely the total cars divided by the number of working days in the period—in this case 14. The third column is the car weight of the loader expressed in tons and decimals of a ton. This is merely the total tons divided by the total cars. The last four columns are the essential ones.

The first is the column showing the attendance of each man expressed in the percentage of the number of days he sent out coal. As the men did not report for work at this mine and no record was kept of their attendance, it had to be assumed that they were at work on every day that a car was dumped having their check.

The second column is the car-weight efficiency. It was assumed in this case that, as some of the men regularly loaded their cars with 1 ton 13 cwt. (1.65 tons) of coal, all could do the same. This was purely a machine mine. and all the men were working under practically the same conditions; so each man's car weight was divided by 1.65 tons and the efficiency expressed in percentage. The highest car weight efficiency at this mine was 104; the lowest 72, or 1 ton 3.6 cwt.

The tonnage efficiency was calculated on a basis of a task of 7 tons a day. As the price per ton was 42c., 7 tons would give $2.94 as the earnings per day. Since in other regions the union scale calls for $3 a day as the amount a miner should earn, it was considered that 7 tons was a good basis, giving, as it does, almost $3. The highest tonnage efficiency was 134, while the lowest was 48. Twenty men had 100 per cent. or better; that is, they sent out over 7 tons on each day they were at work.

On What Does Efficiency Depend?

As the total efficiency of a man is dependent upon the regularity with which he sends out coal and the manner in which he loads his car, the total efficiency is the product of the attendance, the car-weight efficiency and the tonnage efficiency. As these are here all expressed in percentage, the last column is the product of multiplication of the three preceding ones. One man at this mine had an efficiency of 112, while his next-door neighbor, who was in attendance an equal number of days, had 41—quite a contrast!

Tables 2 and 3 show a summing up of all the sheets of the individual workers for this two weeks at the same mine. Table 2 shows the division of results according to headings. It is self-explanatory, column 1 being the name of the heading; column 2, the total number of cars from that heading, this being divided in two cases according to the work; column 3, the total tons; column 4, the sum of the number of days that the various men worked; column 5, the product of the division of column 2 by column 4; column 6, the product of the division of column 3 by column 4; column 7, the average car weight for that road. The standard car weight at the bottom means that at this mine the men were not paid for any weight which they might have on their car above 1 ton 15 cwt. (1.75 tons). The purpose of making this sheet was to find out where the men were getting the most cars and where the tonnage was greatest per man, as well as the car weight. Tonnage might be low on account of a poor machine runner or some other cause which would be discovered after investigation.

* Fourteen days worked in the second half of March.

† The standard haul for a mule is 100 tons 1000 feet per day. One mule should haul 1400 tons 1000 feet on a level road.

‡ 1.2% grade in main heading.

§ 2½-ton motor.

Table 3 is a further summation of the work. This was made to give a comparison between the transportation units used in gathering the coal up to the point where it was taken by the main road motor. As the work of getting the cars to the men should not be judged by the number of cars that come from a road without considering the conditions under which the work is done, the grades encountered are marked.

The general standard for mule haulage is that one mule can haul 20 ton-miles in a day; that is, a power equivalent to that required to haul one ton 20 miles or 20 tons one mile on a level road. This is equal to hauling 100 tons for 1000 ft. It will be seen from this transportation sheet that the two mules hauling to 4C and 5C headings are exceeding this standard, hauling 1474 tons a distance of 1000 ft. for the 14 days, part of the haul being on a 4½ per cent. grade. This is good work. In contrast is the work of the motor, which was doing only 203. It showed that the motor was not being used to its full advantage, though needed for a dip heading, since it was doing less than a mule. As a side light on the motor, it was found that the son of the boss was running it.

The examples shown for a mine are given for only two weeks. The application of efficiency principles means the keeping of continuous records. There are many forms that can be used, but the essential is that they shall be the record of each individual and not the record of a mass.

They may seem so simple as to be hardly worth keeping, but good use can be made of them. Bookkeeping is done for all money expended, whereas little is done for labor expended, but it is just as necessary. These records should be in the form of journals and ledger accounts.

As to the saving in dollars and cents that can be made, it runs in all directions. Perhaps as simple as any is the saving in arguments. There is nothing so deadly to an argument put up by a poor workman that he cannot make a day's pay as the fact, which he soon learns, of there being a complete record of his work in comparison to the men around him.

Then, too, it will be frequently found that 75 per cent. of the coal is sent out by 50 per cent. of the men. If the other 50 per cent. of the men were brought up to standard, normal output, the total output would be increased 50 per cent., with a consequent reduction in cost. But when an attempt is made to increase the output, it is a good plan to know in what particular each man falls down. On the sheet shown in Table 1, loader No. 127 got out less coal than No. 145 though he loaded three more cars, because his car weight was 2 cwt. less. At that he was 0.17 below the standard. This equals 11 per cent. of the weight on the car. His loading of a full car would decrease the transportation cost on his cars 10 per cent. If the transportation cost is 15c. a ton, this is a saving of 1½c.

Continuous records are particularly useful in any mine where allowances have to be frequently made on account of the dead work due to irregularities in the coal. As to the labor involved in keeping up records, one such as is shown in Table 1 can be posted each day in about 15 min. for each 100 men. The compilations at the end of the two weeks take about half a day.

Of Interest to Miners

By John Majer*

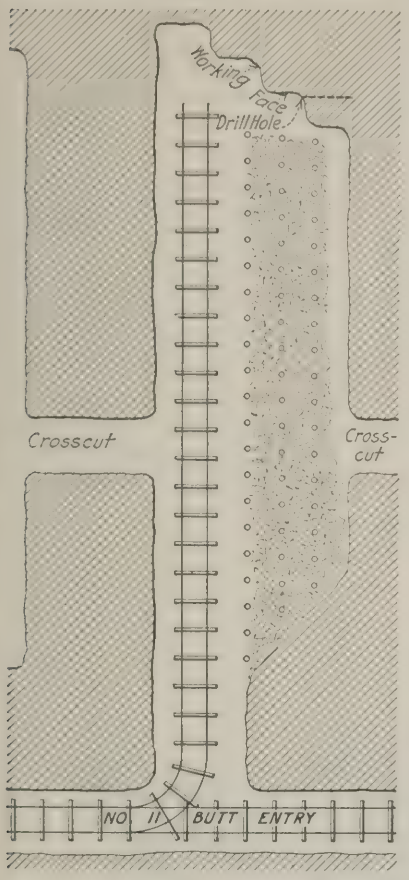
I was conversing with a friend a few days ago, and in speaking about mining laws he stated that at the mine where he was employed they were "compelled to use only permissible powder for blasting the coal" and complained that it "broke the coal too fine," which meant a great loss to the miner because he was paid only for lump coal. Frequently, also, a shot would misfire and the miner must then go home without having any coal ready for the next day. But the "greatest trouble," he claimed, "was to keep sufficient earth on hand for tamping the holes." Each miner was "compelled to provide his own earth for tamping," which was a requirement of the mining law.

At this point I interrupted him, to tell an incident in my own experience that, I believe, will be of interest to all Coal Age readers. I had been working three years in the mine at the time the accident happened that I am abount to relate. Previous to that time I had worked continuously as a miner in gaseous mines. My experience of nine years in mining coal convinces me that there is little fear of danger if miners will stop fooling with gas feeders and obey the mining law.

The mine where I was working was well ventilated and operated in full compliance with the law. The coal was 3 ft. 2 in. high and overlaid with a solid roof. There was a "binder" near the bottom of the seam, varying from 1 to 4 in. in thickness, and beneath this was 5 in. of coal. I found that it always took more powder to break down the coal when the shot was mined below than when the mining was done in the top of the seam and the shot placed below. For this reason I mined all my coal in the top of the seam, which gave better coal and made it easier to pick out the binder, which was then easily separated from the coal in large pieces.

---

*Garrett, Penn.



Plan of Room, Showing the Location of the Shot

In the accompanying sketch I have shown the condition that existed at the face of the room where we were working, at the time the accident happened. The room was driven about 50 ft. ahead of the crosscuts shown in the figure. We took out the coal, as indicated, in steps about 6 ft. wide and 3½ ft. deep, mining the coal at the top and placing the shots in the bottom of the seam. At this time, we had altogether about three cars of coal blasted down and ready to load when I suggested eating our dinner. My buddy, however, had drilled the hole shown in the right-hand corner, at the face of the room, and he wanted to shoot this hole and then take his dinner while the smoke was clearing away.

While I started to eat, he prepared a charge of 6 in. of a 4-F grade of black powder. I offered to assist him, but he preferred to do it himself; and when he was ready and called "Fire" we both hid in the crosscut between this room and the next and waited for the shot to go off. This shot failed to break the coal, however, blowing out the tamping with a whistling noise ("squealer"). I remarked that he had not used enough powder to break the binder. After eating our dinner, we examined the hole together, and I suggested that we load out the coal already shot down before shooting the hole again. My buddy was mad, however, and persisted in drilling and firing another hole in the middle of the seam.

While he was drilling this second hole, I prepared a charge of 7 in. of powder and after inserting this in the hole tamped it with coal slack. When this was done and the shot lighted we both hid, as before, in the crosscut. Whether the result was due to there being two holes or whether the first shot had sprung the coal I do not know, but the explosion filled the room with flame for several seconds, the flame extending to within 10 ft. of the crosscut. I shall remember the incident all my life as we were both terribly frightened. I want to urge, here, every miner never to fire a shot until all fine coal, slack and inflammable substances of any kind whatever have been cleared away, especially any powder remaining after charging the hole. I want to suggest, also, as a means of safety, that coal operators should furnish their miners with enough clay to tamp every shot. Coal-dust should never be used for this purpose.

Coal Used by Power Plants

R. E. Horton in *Engineering News* tabulates some computations of the yearly coal consumption in tons under various conditions and based on the use of 1 lb. of fuel per horsepower-hour:

COAL REQUIRED PER HORSEPOWER-YEAR, THE AMOUNT OF COAL USED WHEN RUNNING BEING TAKEN AS ONE POUND PER HORSEPOWER-HOUR

	Gross Tons, 2240 Lb.		Short Tons, 2000 Lb.	
Method of Operation	310 Days	365 Days	310 Days	365 Days
10 hr. per day, no banking.......	1.38	1.63	1.55	1.83
10 hr. per day plus ⅓ for banking	1.84	2.17	2.07	2.43
12 hr. per day, no banking.......	1.65	1.96	1.86	2.19
12 hr. per day plus ⅓ for banking	2.21	2.61	2.48	2.92
24 hr. per day, no banking.......	3.32	3.91	3.72	4.38

When the consumption per horsepower-hour is known or assumed it can be multiplied by the figures in the table. For example: A plant runs 10 hr. per day and 310 days per year, generating an average of 500 hp. It uses 2½ lb. of coal per hp.-hr. and needs an allowance of ⅓ for banking. Coal costs $3.50 per gross ton. From the table, the proper unit consumption per horsepower-year is 1.84 gross tons. Consequently

$$2.5 \times 1.84 \times 500 \times \$3.50 = \$7735 \textit{ annual cost.}$$

Sometimes it is necessary to know how many tons of ash will have to be disposed of each year; then the decimal proportion of ash in the coal can be substituted for the price per ton. For 15 per cent. ash the foregoing example shows

$$2.5 \times 1.84 \times 500 \times 0.15 = 345 \textit{ gross tons.}$$

Rhode Island Anthracite

Rhode Island anthracite has long been a puzzle to mining men and capitalists. Is it a fuel or can it be best used for making refractory linings for blast furnaces? After a study of the Rhode Island anthracite field, the character and qualities of the coal and the results of tests of its use in house and steam furnaces and in the making of briquettes and coke, the U. S. Geological Survey has published a preliminary report by George H. Ashley in Bulletin 541-F.

The coal has been known in Rhode Island for 150 years or more and during the last 100 years scores of attempts have been made to mine it commercially in many places. With one exception these attempts have not been successful, and most of the mines have been abandoned within three years.

In general it has been found that Rhode Island anthracite is difficult to handle, and that the cost of handling, on account of the large quantity required to produce a given amount of heat and the higher percentage of ash, will be greater than that of other coals; furthermore, when burned it can produce only from 40 to 80 per cent. of the heat units produced by the coals with which it necessarily must compete. In general it may be said to show about two-thirds the heat value of Pocahontas coal and when the extra cost of handling the coal and ash is reckoned it may be estimated that Rhode Island anthracite will yield not over one-half the heat afforded, dollar for dollar, by Pocahontas coal.

A Powerful Tractor for Heavy Delivery Service

SYNOPSIS—Description of the new Knox tractor, which embodies the latest ideas in heavy motor construction. The machine transports a load of 10 tons and is equipped with electric starter, a new type of direct and hydraulic brakes and several other novel features developed after considerable experimentation.

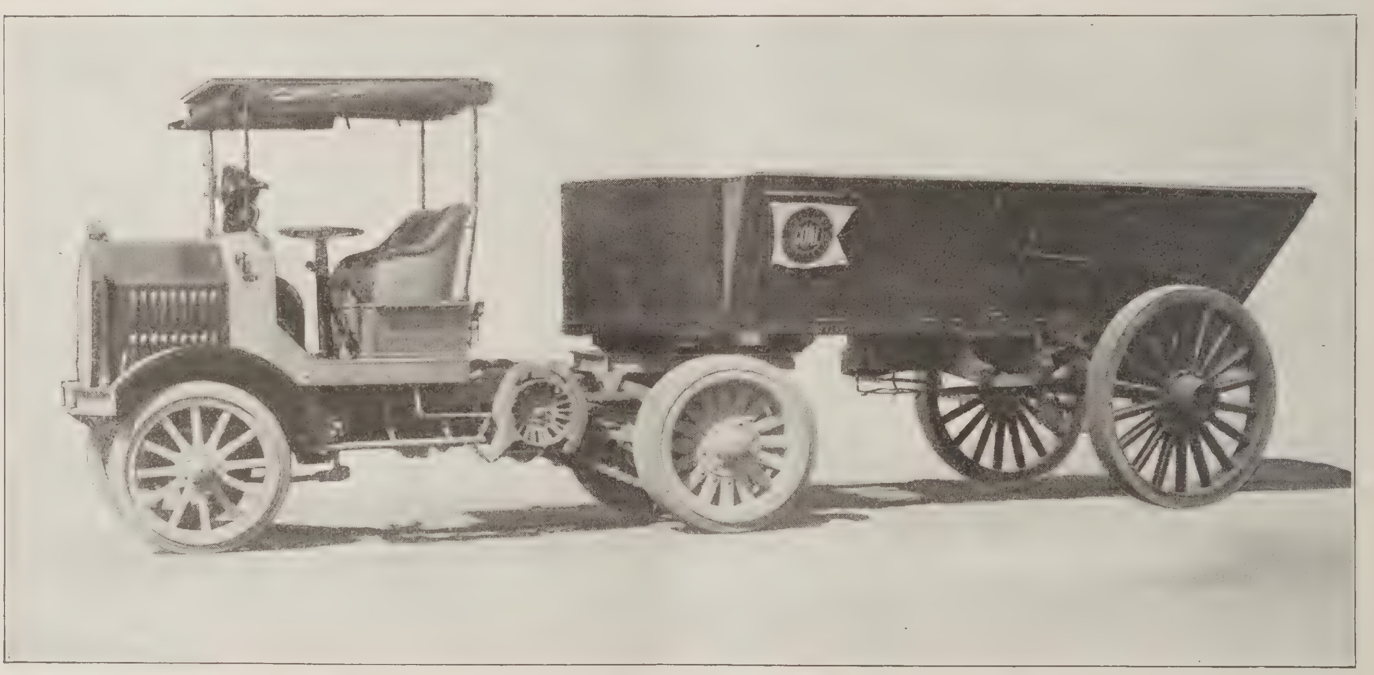
A motor vehicle capable of carrying a 10-ton load with 60% of the weight on large steel-tired wheels has just been put on the market by the Knox Motors Co., of Springfield, Mass. For several years this company has been manufacturing a three-wheel tractor in which the front end of an ordinary heavy truck was carried on a platform over the rear driving wheels of the tractor.

This machine has now been redesigned with two wheels in front instead of a single wheel and with a number of novel features. The illustration herewith shows one of the new type tractors equipped with a heavy truck as a trailer. The trailer vehicle may be of any type desired. The front end of the trailer vehicle rests on a turntable over the rear wheels of the tractor.

General Details of New Tractor

The new tractor, fully equipped but without a trailer, imposes a load on the front pair of tires of 3750 lb. and on the rear tires of 4700 lb. When the trailer is attached there is no increase of the load on the front tires, but with an ordinary truck about 40% of the weight of the trailer with its load is carried by the driving wheels of the tractor and 60% by the rear wheels. If the trailer carries a paying load of 20,000 lb. and its weight empty is 4000 lb., the total weight on the driving wheels of the tractor would be about 14,400 lb., and about the same weight would be carried by the rear wheels of the trailer. The wheelbase of the tractor itself is 108½ in.

The front wheels have 36x4-in. solid tires, and the driving wheels have 38x6-in. solid double tires. The width of the face of each section of the driving-wheel tires is about 4½ in., or 18 in. for the two wheels. Thus the total weight imposed on the road surface by the driving-wheel tires of the tractor when carrying a fully loaded trailer is about 800 lb. per in. of width. Notwithstanding the length of the whole vehicle when the trailer is attached, it can turn in very crowded quarters, as the front wheels are so designed that they can be skewed to a sharp angle, and the center plate on which the front end of the trailer rests is so designed that the tractor can swing to a sharp angle with the trailer and not foul anything.



Side View of the Tractor with Coal Wagon Attached

By an ingenious arrangement of springs, the tractor machinery and the driver are carried easily and smoothly over rough roads and left entirely free from the jar of the heavy load carried on the trailer and the driving wheels. The load on the center plate which supports the front end of the trailer is carried by very stiff and heavy springs to the driving-wheel axle, while flexible cantilever springs 48 in. long, entirely independent of the heavy springs, support the rear of the tractor chassis and have their rear ends resting in slideways under the rear axle. Thus the rear axle is isolated from the tractor chassis, and while it is maintained in line by strut rods it is free to move up and down, equally or unequally as to either of its wheels, without motion of the chassis. This construction should not only add materially to the comfort of the driver, but should be of advantage in relieving the engine and propelling machinery from the jar and vibration inevitable when a very heavy load is carried on a freight truck, besides relieving the tractor chassis from twisting stresses.

A very interesting feature in the design of the propelling machinery is the interlocking differential lock. As every driver of a motor car knows, the differential gear through which the rear axle is driven, while absolutely essential to enable the vehicle to turn corners, is a very serious drawback to the effective traction of the machine on slippery or muddy roads. If either driving wheel slips, the entire power is transmitted through the slipping wheel, while the other driving wheel remains stationary just at the time when its effective traction is most needed.

The differential lock is a mechanism by which the driver, by pressing down a lever in the floor of the cab, can lock the differential gears so that the two driving wheels are compelled to turn together as if the rear axle were one rigid piece. If, however, this lock were thrown into the gears with the engine running and one driving wheel slipping, perhaps at high speed, breakage of the gears would be inevitable. In order to prevent this, the mechanism by which the differential gear is locked is connected with sliding bars which move the transmission gears and throw the transmission into neutral position before the differential lock can engage. Of course, when the transmission gear is thrown to neutral, the slipping rear driver in contact with the road instantly stops. The mechanism by which this result is effected is quite similiar in its general design to the familiar mechanical interlocking apparatus for railway switches and signals. After the driver has locked the differential, he can then set the speed-change gear to any position he desires.

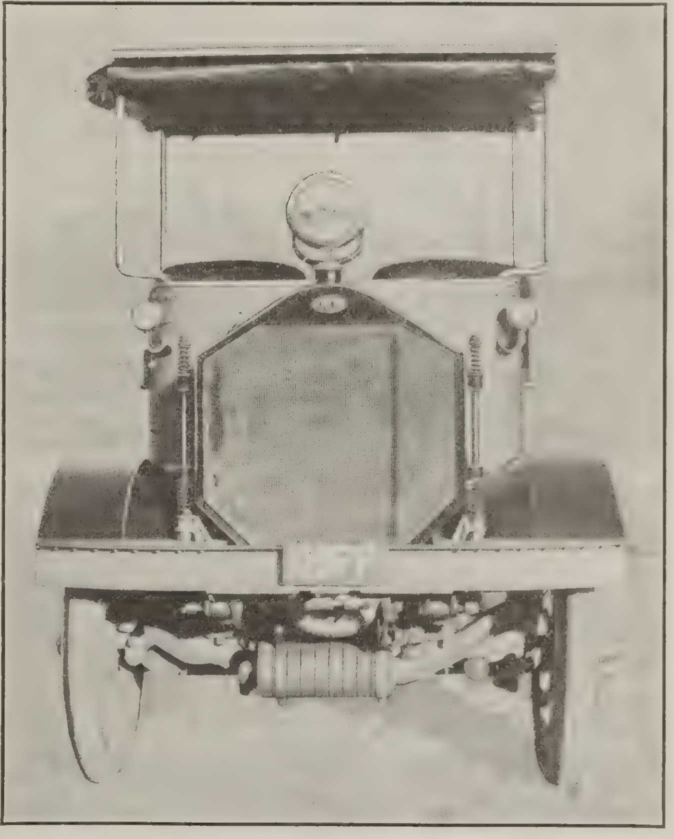
Brake Arrangement

A feature of truck design which has given much trouble with trucks operated in hilly country is the braking system. As every engineer knows, a brake is merely a mechanism for converting the inertia of a moving vehicle into heat. On an ordinary touring car weighing 1500 to 4000 lb. the usual type of brake, consisting of a contracting band on the exterior of a brake drum on the rear axle with an expanding band on the inner surface of the same drum, works satisfactorily. The amount of heat generated by the brake is not great enough to cause overheating of the parts, and on long and steep hills careful drivers generally use the engine to assist in retarding the car. When a heavily loaded truck is descending a long hill, however, the number of foot-pounds which must be converted into heat between the top of the hill and the bottom becomes so great that, unless sufficient surface is given the brakes and sufficient provision made for the dissipation of the heat, difficulty is apt to be experienced.

The service brake on the new Knox tractor is designed, not on the lines of the ordinary pleasure-car brakes, but on those of railway-car braking practice. A cast-steel drum, 14 in. in diameter and 4-in. face, is secured to each end of the jackshaft. A foot lever in the driver's cab enables him to bring a pair of cast-iron brake shoes in contact with the faces of this drum. The driver can automatically lock this brake lever in any position he desires. The inner surface of the drum has a large number of projecting ribs for radiating the heat developed. The cast-iron brake shoes are as easily removable and about as cheap to renew as the brake shoes on a railway car. As the jackshaft turns in fixed bearings and is not variable in position with reference to the chassis, as is the wheel of a railway car, the brake shoes can have a very close adjustment, so that very small motion of the foot lever is required to apply or release these service brakes.

In addition to this effective service brake, an emergency brake, operated by hydraulic power, is applied to the interior of two heavy drums 20 in. in diameter and 6½-in. face, secured to the rear axle, the driving spocket forming part of the same drum. The hydraulic pressure is transmitted by a flexible pipe from the pressure pump in the driver's cab to the brake-operating cylinder on the rear axle. Thus the rear axle may move as it pleases with reference to the chassis of the tractor without affecting in any way the adjustment of the brake.

The hydraulic pump applying the brakes is operated by a hand lever convenient to the driver's seat. Three or four quick strokes of the pump are sufficient to bring the expanding brake bands in contact with the drums on the driving axle. The ratio of the hydraulic pump plunger and of the brake-band setting plunger is 10 to 1, enabling the driver to exert an enormous braking force on the driving axle. This brake pressure is maintained until the handle of the hydraulic pump is moved forward to the end of its travel, when a valve is released, allowing the liquid to flow back to the reservoir, when the springs withdraw the brake shoes from contact.



Front View of Tractor

Speed Control, Oiling and Electric Starter

Another interesting departure from ordinary motor-truck design is the omission of the governor generally applied to motor trucks to limit the speed at which the vehicle may be run. Instead of applying a separate governor, the designers of the motor used on the tractor have adopted such proportions that at a speed of 1000 r.p.m. the horsepower of the motor begins to rapidly fall off, in whatever gear the transmission is running.

The gear ratios of the transmission are such that with the motor running at 1000 r.p.m. and the transmission in high gear, the tractor will run at 9.4 mi. per hr. In intermediate gear the speed of the tractor is 3.9 mi. per hr. In low gear the speed of the tractor is 1.6 mi. per hr.

Another interesting and important mechanical feature is the use of oil under pressure for lubrication. Lubricating oil is forced to the main bearings by a small gear pump which delivers the oil under a constant pressure of 30 lb. per sq.in. through holes drilled into the center of the main bearings. This is the system of lubrication now in use on the bearings of large marine naval engines, where the service is most severe. Experience has shown that under these conditions a constant film of oil under pressure is maintained between the shaft and its bearings, and wear is practically eliminated.

The truck is equipped with an electric lighting and starting system. There is little doubt that this will be considered an economic necessity in future motor-truck design. If hand-cranking must be used to start the motor, drivers will inevitably keep the engine running idle whenever the truck is standing rather than undergo the exertion of cranking it; thus idle running involves a constant waste of fuel and keeps the engine hot. With an electric starter the driver stops the engine whenever the truck stops, knowing that he can start it by pressing a button.

The motor of the tractor has four 5x5½-in. cylinders, cast in pairs and having the valves placed in the heads, which are bolted to the cylinders. The gasoline supply is contained in a 25-gal. reservoir and is fed by a vacuum system to the carburetor. Four gallons additional is carried as an automatic reserve supply.

Finally, it may be noted that the engine has been specially designed with a view to work in wet and muddy regions. The carburetor, magneto, generator and starting motor are all placed high upon the engine, at least 31 in. above the ground level, so that in case of necessity the machine can be run through water of a considerable depth without being put out of commission.

⁂

Extracts from a Superintendent's Diary

When our lawmakers perfect and put into operation suitable laws covering minimum wages, employers' liability, old-age pensions, etc., they will have made it possible for a superintendent to follow the dictates of his conscience at all times without violating general company rules governing rates of wages, maximum number of employees in different departments, etc.

Company auditors in general offices far removed from the base of operations can think only in terms of averages, and they have perfected systems based on averages that enable them to pick out all force-account and payroll variations, no matter how small the variation in wages or number of employees may be.

But model cost sheets with all the deadheads eliminated make no provision for tiding over faithful men who through circumstances often beyond their control, such as sickness or accidents out of working hours, are obliged to live somehow without working, often for long periods of time; nor do they carry pensions for men grown old in the service, nor for widows and orphans of men killed through their own carelessness, but killed nevertheless, and at inopportune times, often with cupboards left bare.

When the time arrives, then, when no more cripples or pensioners can be carried on the roll without exceeding the maximum and thus attracting the attention of the auditors, the superintendent's troubles will begin; I know whereof I write because my troubles began last month.

There has never been a time since I was granted a superintendent's title that I have not been contributing out of my personal income a small amount at least toward some unfortunate family's support; lately the demands (all of them worthy of generous response) have become so numerous that I have stretched my conscience almost to the breaking point by throwing some of the burden on the company, just as if the company had made regular provision for such emergencies.

It's all very well to say that Dick Brown lost his life through his own carelessness and deserved just what he got, but so long as Dick Brown's family remains on the verge of starvation within our camp the manner of Dick's death can have little effect on our treatment of his family. Likewise it's a simple matter to say that Old Man Smith would not have been penniless if he had persistently saved a very small portion of his savings over a period of years and therefore deserves little sympathy, but so long as Old Man Smith remains in our camp we are not going to sit calmly by and watch him starve, sympathy or no sympathy.

Friends of unfortunates are always willing enough to head subscription lists and take them through the camp, and most of our citizens do subscribe liberally to all such appeals; but the necessity of aiding by private subscription men grown old in a company's service has never seemed just to me. It is possible to use a certain number of cripples and old men to replace boys employed as trappers, tipple hands and the like, but here again one's conscience asserts itself, and the man who can serenely watch a crowd of broken-down old men and cripples forced into service that they may drive away the wolf at their doors would soon bring his company into bad repute.

I have just been reading an article dealing with compulsory old-age pensions, and the author characterizes all such legislation as a blow aimed at personal liberty; he sees in such legislation nothing but the secret workings of soulless corporations.

Evidently the author of that article never had his conscience put to a test by being called upon to create positions on corporation payrolls to take care of derelicts.

⁂

Coal Output of China

From a recent report of the Ministry of Agriculture and Commerce at Peking it appears that the output of coal in the various provinces of China during last year was 9,272,000 tons, says *Commerce Reports*, divided as follows: Manchuria, 840,000; Hupeh, 100,000; Chihli, 2,160,000; Anhuei, 60,000; Shansi, 2,500,000; Shantung, 932,000; Honan, 900,000; Szechwan, 300,000; Kiangsi, 800,000; Hunan, 500,000; Shensi, 50,000; Kwangtung, 50,000; Kansu, 50,000; Yunnan, 30,000.

⁂

Assumption of Risk by Miner—Notwithstanding the legal duty of a coal operator to make safe miners' places of work, a miner assumes the risk of being injured or killed in walking under a defective roof in the main entry of a mine, after he has been warned against the danger and his attention has been specially called to the defect. (United States Circuit Court of Appeals, Eighth Circuit; Pearson vs. Rocky Mountain Fuel Co.; 219 Federal Reporter 496.)

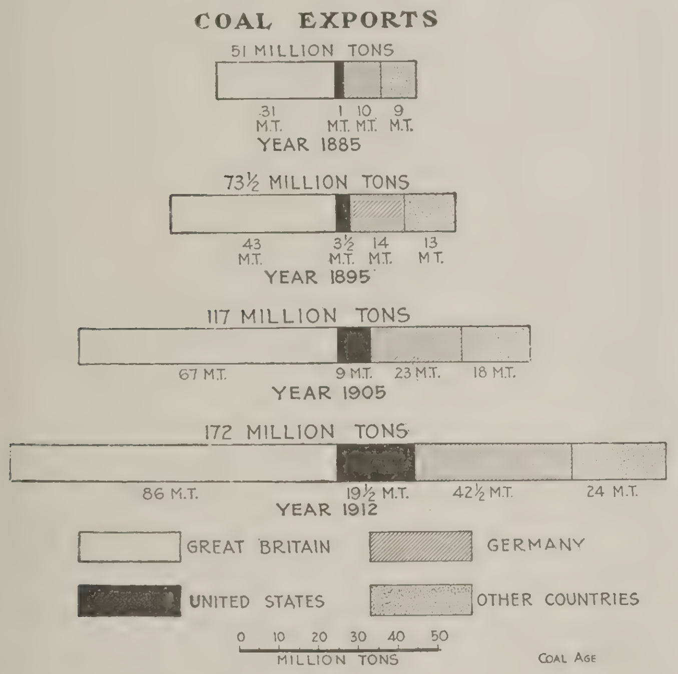
A British View on Our Export Opportunities--II

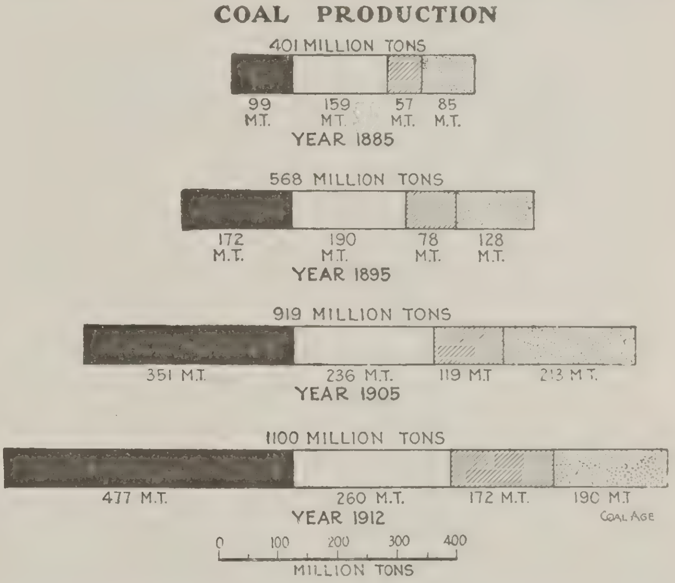
By G. Breffit*

SYNOPSIS—This is the second and concluding article by Mr. Breffit. The ultimate prominence of the United States coals in the world's markets is now an accepted fact. The author also discusses the adaptability of our coals for export business and outlines a tentative scheme for entering the foreign markets.

There is no doubt that America is destined to be the chief source of coal supply, and as soon as an export business from the United States is fairly commenced, the progress will be rapid. But a shop must be opened before customers come to buy, and at the present time foreign purchasers scarcely recognize this country as being in the market to sell.

As this export business grows, it will have its effect upon what has been best described as the "set of trade." New markets for the use of coal will be opened, while the transportation of coal itself will increase bunker requirements, and more coaling depots will be needed; in short, it is an example of business making business.





Graphic Representation of the World's Coal Production and Exports

An illustration of the gradual change in the "set of trade," as applied to the British coal exports, will be found in the accompanying statement (Table D) showing the quantities and percentages exported to each group of countries every fifth year for the last half century. Some lesson is usually to be learned from statistics, dry though they may be, and the object in working out these particular results is to show how, as the coalfields of the United States and of the Far East have developed, the British trade with groups 5, 6, 7 and 8 has dwindled, finding its replacement in the increase with groups 1, 2 and 9, while groups 3, 4 and 10 (at no time of any magnitude) have remained almost stationary. This is the grouping that has been adopted by the statistical department of the English Board of Trade, the boundaries of each being roughly shown on the map.

Export business should be cultivated. Although it is a healthy sign for a country to consume its own production of coal, the United States is really too dependent upon its home customers. An "equilibrium" is wanting, and as a result there is irregularity of work, which is bad for both employers and employed. Besides, regular work means cheaper coal, and in the long run it is the home consumers who benefit by this. Therefore an increase of exports becomes a benefit to the people and should be encouraged whenever possible by the state.

At first sight it would appear otherwise, as any addition to the vendors' list of customers would tend to strengthen prices, to the detriment of existing buyers; but this hardening tendency is more than compensated by the cheapening of production consequent upon more regular work, so that a coal owner could make larger profits without raising his price—or even in spite of lowering it.

Appended hereto is a statement showing the chief destinations of coal exported from Great Britain, Germany and the United States in 1905 and in 1912. It may be observed in this statement (see Table F) that the exports from Germany, although increasing annually to all countries, are chiefly in the direction of contiguous countries; exports to "other countries" being only from 3½ to 7 per cent. of the total.

Probably the ideal organization would be a coöperation of all the coal producers in the world, but this may be at once dismissed as entirely impracticable. Nor is it worth while to discuss the coöperation of all the producers in one country; the interests are too diffuse and the condi-

	47,476	16,831	9019	64,445	30,644	17,689

tions too various, to be brought together in one line.

But to associate all the producers of one district, or even the producers of a particular class of coal in one district, is both feasible and worthy of consideration; and when the success attending the Westphalian scheme is reviewed it is surprising that such associations are so rare.

Control may be obtained in several ways, such as:

(a) By purchase of the undertakings.
(b) By amalgamation.
(c) By pooling sales.
(d) By convergence of sales to one office.
(e) By purchase of the greater part of production.

(a) Entails an enormous capital outlay, even if the purchases can be effected at prices satisfactory to the buyer, which is unlikely.

(b) Cannot be hoped for to any large extent, owing to the difficulty in agreeing upon the valuation of each component part.

(c) Is only applicable either when the several interests all produce the same quality, in which case each is content to receive the same price as his neighbor, or when the variations in quality are so exactly represented by the variations in price that the results admit of no dissatisfaction.

TABLE D—EXPORTS OF COAL FROM GREAT BRITAIN—TO THE 10 GROUPS OF MARKETS (GIVEN IN THOUSANDS OF TONS)

(d) Is the simplest method, as it involves only the consent of individual operators to the principle and the assurance of a capable and trustworthy administrator. There is no disturbance of capital, no pooling, and no disclosure of internal affairs.

(e) Requires no "consent," and could be operated by anyone endowed with sufficient credit to make unlimited purchases. The actual cash for working capital (beyond payment of railroad freights) is not necessarily large, all depending on whether any longer credit is allowed to buyers than is obtained from sellers.

In any of these cases the principle sought is that of "selling from one office," in order that fluctuations in prices may be accommodated to the relation of supply to demand and nothing else, and so do away with the unnecessary competition which so frequently cuts prices needlessly.

In addition to this, the operator (or the administrator, as the case may be) could so handle his product as to be in a position to offer exceptional terms to consumers—particularly guaranties, under specified penalties, as to quality. Such a condition would be onerous to an individual coal owner, while it could be undertaken with comparatively little risk by a group of producers, or by the administrator, because of the varied sources of supply.

Adaptability of American Coal for Export

The production of coal in the United States is not only very large, but is so varied in character that there is little doubt as to the ability of this country to supply, with a few exceptions, the entire demands of the world. The exceptions include:

(1) The high-grade smokeless steam coal, which has so far been found only in South Wales and which has a special market (where price is not of first consideration) in warships and mailboats.

(2) The very dry steam coal, verging upon anthracite, suitable for the manufacture of producer gas, of which there appears to be no supply in the United States.

(3) Coking coal. Of this there is a large production, but it is all needed in this country and none can be spared for export; particularly as the area is not extensive and at the present rate of exhaustion will be worked out in a comparatively short period.

But with the exception of the special demand upon No. 1, which this country does not produce, and on No. 3, which is not for sale abroad, it appears that the United States has coal to offer suitable for every purpose and that it is only a matter of price, regulated by efficiency, as to what portion of the world's orders can be booked.

The classes of coal used and the proportions required vary considerably in different countries. From the point of view of quantity, the markets of France and Italy are, to the English merchant, of equal importance, both countries importing about 10 million tons of British coal annually, but there is much difference in the class of coal bought by each. Italy produces no coal, and the quantity imported from Great Britain is practically all Italy consumes, less than 5 per cent. coming from other countries. France, on the other hand, uses 35 million tons of native coal and buys another 10 million tons from Germany and other countries besides the 10 million tons from Great

Britain; so that French purchases are, to a greater or less extent, confined to selected qualities, while the Italian imports are fairly representative of the country's needs.

I would sum up the foregoing into three recommendations:

(1) Organize internally with the view of lessening competition and of economizing production.

(2) Please your customers by helping them to find out what best suits them; by giving them this, or the nearest approach to it possible, or, if you do not produce it, by getting it for them.

(3) Obtain all information of what is going on in other countries, statistical and otherwise; remembering that anything, no matter how trivial or apparently irrelevant, may have a bearing upon international competition.

Some Notes on Fuel Consumption at San Francisco

The population of Oakland, with Berkeley and Alameda, is estimated to be 300,000 at the present time, and taking all the cities and towns situated on San Francisco Bay into consideration, the population is very nearly a million. San Francisco has an even climate the year around; its highest mean temperature is given as 61 deg., for September, and its lowest as 50 deg., for January. The average date of the first frost in autumn is Dec. 10 and of the last in the spring is Jan. 25. San Francisco is the financial center of the West and occupies eighth place for bank clearings in the United States; these amounted to $2,624,428,532 in 1913.

RECEIPTS OF COAL AT SAN FRANCISCO (IN TONS)

Year	British Columbia	Australia	Great Britain	Japan	China	Washington	Oregon	Domestic Eastern	Rail	Grand Total
1906	311,099	72,638	37,215	.....	.....	110,670	42,975	11,455	.....	586,052

Oil has replaced coal for steam production on the Pacific Coast and nowhere to a greater extent than in California. In addition, coal has had to contend with the competition of electricity and gas here as in other places. Electricity is produced by water power, and for reserve power the companies are keeping steam plants that burn crude oil. The gas is produced and sold generally by the companies that sell electricity. The gas is now made from oil instead of from coal.

The marine department of the San Francisco Chamber of Commerce compiles an annual statistical report of all the coal brought into San Francisco harbor as cargo and of all that which enters by rail. The Oakland Chamber of Commerce does not compile statistics, and figures are not available for coal entering other ports of San Francisco Bay by rail. These figures as compiled are shown in the table herewith.

Developments in Ocean Shipping Facilities

That some shippers are intending to enter oversea markets as a permanent thing appears in a recent announcement of ships being built to carry coal from Chesapeake Bay to Mediterranean ports. Two steamers, each of 7500 tons' capacity, to be operated by the Coastwise Transportation Co., of Boston, have been chartered for six years in this service, and it is understood they will usually load in Baltimore. These ships will be 400 ft. long and 55 ft. beam, with engines amidships. The keels have already been laid at Camden, N. J., and one is to be ready in October and the other in December. Other ships are in process of construction, but are designed primarily for coastwise trade. Among these are the three steam colliers, of 5000 tons each, for the Pocahontas Navigation Co., which will be factors in the Pocahontas field.

Situation in the Middle West

The more hopeful Indiana and Illinois operators feel that any change would be for the better, conditions now being at their worst. Current shipments are confined absolutely to orders, and in consequence there is little consignment coal on hand to disturb things, which is encouraging. There is also a renewal of activity in manufacturing and industrial circles in the Chicago district, which should soon reflect favorably on the coal trade. On anthracite, some orders have been placed at April storage prices, but there is no movement of consequence. The old-line companies are maintaining circular prices, but the independents make concessions to obtain orders.

Conditions at Milwaukee

Summer retail rates on coal at Milwaukee went into effect on Apr. 1. Nearly all anthracite grades with the exception of buckwheat now retail at 50c. per ton below the winter rate. Egg and stove sizes of anthracite are quoted at $7.60 per ton instead of $8.10, chesnut at $7.85 instead of $8.35, and pea size at $6.55 instead of $6.60. Buckwheat remains at $5.25. On bituminous, Pocahontas sells at $6 as against $6.50 during the winter and Hocking Valley at $4.75 instead of $5.25.

With the exception of stove coal the supply of domestic fuel coal is ample; some dealers have been short on this grade and have been replenishing their stocks by rail. Some cargoes of anthracite now afloat at Buffalo will come forward as soon as navigation opens. Stocks of soft coal on the docks are a little above normal and the rate of shipment fair. Indications are that the movement for the coming season will be about the same as that of last year. It is the policy of Milwaukee coal-handlers to keep stocks replenished to the limit of storage capacity. Milwaukee's favorable situation as a distributing center is reflected in the stability of her coal trade.

* * *

The following values for power factors may be assumed for circuits and used in any calculations when exact values are not known:

Incandescent lighting and synchronous motors ..	95 per cent.
Lighting and induction motors	85 per cent.
Induction motors alone	80 per cent.

Coal in Canadian Middle West

The importance of the coal deposits of Saskatchewan, occurring as they do in a territory lacking almost entirely resources of timber or water power, has been to a great extent overlooked in the past, says Consul Samuel C. Reat, of Alberta, in *Commerce Reports*. Of late years the investigations carried on by both the Department of Mines, Ottawa, and the Geological Survey of the United States, on the coals of the same character on the other side of the international boundary, have brought out facts which place these deposits on a much higher plane, and these investigations have paved the way toward obtaining more definite data which will develop uses for these low-grade lignites for purposes hitherto thought impossible.

The more important districts, or rather those districts which have been studied in any detail, are very few; but there is no doubt, as the demand for coal grows, other districts will be developed.

The only important district at present from the shipping standpoint is the Estevan district, while the Willow Bunch area has been tapped by a railway only lately. From estimates computed by the Geological Survey of Canada, it is found that the coal resources are enormous. The estimated tonnage in the Belly River formation is 33,908,000,000 tons. In the Tertiary formation in the Souris area, consisting of eight townships, there are 2,304,000,000 tons, while the area to the west of Souris has possibilities up to 23,600,000,000 tons.

The principal mines of the Estevan district are those of the Western Dominion Collieries Co., whose property is equipped for an output of 1000 tons per diem; those of the Manitoba & Saskatchewan Coal Co., equipped for an output of 2000 tons per diem; and those of the Eureka Coal & Brick Co., with an output of 200 tons per day. There are some 15 to 18 other smaller mines, supplying mostly local markets and working intermittently.

According to a report just issued by the Dominion Government the 3,821,739 short tons of coal produced in Alberta for 1914 was 11.25 per cent. less than in 1913. The export of coal from Alberta to the United States last year was 106,087 tons, according to the official report. The declared export returns from this consular district show only 7774 tons.

There are 246 coal-producing mines in the Province of Alberta, of which 62 were new mines opened up last year. The cost in lives of this 3,821,739 tons of coal last year was 209 victims of fatal accidents, of whom 189 were killed in the Hillcrest mine alone and 1 man on the surface, making the mining accidents, aside from the Hillcrest, only 20 for the whole province.

North Dakota's New Coal Laws

By A. L. H. Street*

Coal was the subject of two laws adopted by the North Dakota Legislature, which adjourned Mar. 5, 1915.

One of these laws describes the word "coal" as including "all kinds of coal, and . . . what is known as lignite coal." The other law relates to the use of lignite coal in state and county institutions and schools. Summarized, the provisions of this act are as follows:

The various state institutions, county buildings and public school houses of the state must "use for fuel native or lignite coal or lignite-coal products, and it shall be unlawful for any officer to purchase for use in such institutions . . . any coal other than that taken from the mines within the boundaries of this state," except when the cost of other fuel does not exceed that of native coal, and excepting public schools located six miles or more from a mine or railroad station.

The purchases of lignite coal must be based upon proposals invited by notice in a newspaper published and having a general circulation in North Dakota and must be awarded to the lowest responsible bidder. Copies of such proposals must be filed with the Secretary of State. Proposals are to be based upon the standard of 2000 lb. per ton.

The law reads as follows:

> Standard contract grade of lignite coal shall contain as delivered 33 per cent. of moisture as determined at 105 deg. C. For actual weight of moisture above 35 per cent. deduct proportionately the price per ton. Standard contract-grade lignite coal, water-free basis, shall contain from 10 to 15 per cent. of ash. For each 1 per cent. of ash above 15 per cent. deduct 2½ per cent. of the bid price per ton. For each 1 per cent. below the 10 per cent. add 1⅜ per cent. of the bid price per ton. Standard contract-grade lignite coal shall contain, water-free basis, not over 2 per cent. of sulphur. For each 1 per cent. or major fraction thereof above 2 per cent. deduct 2 per cent. of the bid price per ton. Standard contract-grade lignite coal shall contain, water-free basis, 9500 B.t.u., and the price per ton shall be based upon that number of heat units. When the B.t.u. are in excess of that amount, such excess shall be paid for proportionately; and, if the contents are less than 9500 B.t.u., then a proportionate amount shall be deducted from the price. The method of ascertaining the above facts shall be agreed upon between buyer and seller; provided, that any school or institution which does not use to exceed 50 tons of coal in any one year shall not be required to publish for proposals.

Any board that violates the provisions of the act renders its members personally liable for the purchase price of the coal and exempts the institution from liability; "provided, however, that this act shall not apply to country schools or public buildings where no janitor is employed."

A Government Coal Mine

By A. P. Connor

This mine, which was shown on the front cover of Coal Age last week, is owned and operated by the Federal Government. The coal is a lignite variety and is deposited in a flat bed. The mine consists of a series of drifts in a 9-ft. seam, while the workings extend to an average depth of 100 ft. below the surface of the ground.

The main entry in the mine is about 2000 ft. long and 6 ft. in height and width. The rooms where the workings have progressed are about 150 ft. long and 16 ft. wide. The mine is ventilated by motor-driven fans. The workings are wet, the water being collected in sumps and taken out in barrels. The average output of the mine is 100 tons a day. The cost of mining the coal, including maintenance costs, has been found to be $1.78 a ton. The miners are provided with comfortable quarters free, and their wages average from $3.50 to $5 a day.

The mine is situated at Williston, N. D., on the governmental reclamation project there.

⁂

Claims to Ownership of Coal—When underlying coal is owned by a person other than the owner of the surface of land, any title acquired to the surface through adverse possession cannot be deemed to affect the title to the coal. (United States Circuit Court of Appeals, Fourth Circuit; Shrewsbury vs. Pocahontas Coal & Coke Co.; 219 Federal Reporter 142.)

---

*Attorney-at-law, St. Paul, Minn.

The Labor Situation

SYNOPSIS—The Coshocton miners of Ohio approve by referendum vote an agreement with the operators. The rate for run-of-mine coal machine-mined is 51c. for wide work and 60c. for narrow work. A reduction in wages is demanded at a small mine in Pennsylvania, and the duration of a shutdown is extended at Vesta No. 5. Floyd County, Kentucky, is organized.

The joint committee representing the miners and operators in the Coshocton district, which met at Coshocton, Ohio, last week, agreed on a wage scale. This was submitted to the referendum vote of the miners' organization on Apr. 10 and was carried almost unanimously. In all, about 1200 miners in the district are affected, and they have been idle since Apr. 1, 1914.

The scale as formulated by the joint committee provides for 67.6c. for pick-mining on a mine-run basis. In machine-mining in wide places 11c. will be paid for cutting and 40c. for loading, or a total of 51c. In mining by machine in narrow work 13c. will be paid for cutting and 47c. for loading, making 60c. Inside workers are to be paid at the rate of $2.84 per day and outside labor at the same rate as provided in the former scale. C. L. Barnes was chairman of the conference, and the secretaries were E. P. Miller and C. R. Thrapp.

Eastern Ohio Still on Strike

In the eastern Ohio district there were no developments during the past week. Everyone appears to be awaiting the action of the legislature on the Gallagher amendment to the mine-run bill. It is announced that it has been placed on the house calendar for action Apr. 12. Eastern Ohio operators in general believe it will be adopted.

The officials at the miners' headquarters at Bellaire have issued a statement saying that the miners will not sign except on the mine-run basis, no matter what the legislature does with the Gallagher bill.

A Mine Lowers Wages in Somerset County, Pennsylvania

A correspondent at Garrett, Penn., writes that the Atlantic Coal Co. has demanded a reduction of 10% on all day labor and 5c. on each ton of coal, the schedule applying to No. 2 plant. It was also declared that nothing would hereafter be paid for setting timbers. This resulted in a strike of about 200 miners. The Atlantic Coal Co. operates near Meyersdale, Penn., in the Somerset County district.

It is much to be regretted that some operators think they are justified in reducing wages so as to take contracts away from other companies which are still paying the scale customary before the depression. All attempts to secure such advantages over their competitors injure the employees of the other companies and should be resisted by the men working for any management seeking such a reduction. Everyone knows that no company would be disposed to reduce wages if it thought it would have to meet the competition resulting from equal reductions made by its rivals. The whole reasonableness of a cut in the wage-rate lies in the advantage it gives to one employer to undersell a competitor who pays a better wage. He is not out to create trade, but to secure it at the expense of another man who is more liberal to his men and who hesitates to add to their misfortunes by giving them at once both short pay and short time.

Vesta No. 5 mine, owned by the Jones & Laughlin Steel Co., of Pittsburgh, reopened Apr. 8 after a long period of idleness. It is said that the miners refused to return to work unless 18 men formerly employed by the company were reinstated. The company did not argue the matter, but closed down the mine.

The Union in Kentucky and West Virginia

In Floyd County, Kentucky, two organizers of the United Mine Workers of America have managed to form a strong branch of the organization, apparently with the approval of both miners, operators, business men and county officials. The meetings were held in the courthouse. Two hundred charter members were admitted.

The returns on the referendum in the New River and Winding Gulf coal field are now officially reported. The agreement recently made has been ratified by a majority of 156½ votes. Several local unions lost their votes because their returns were made under seal. These were Fayette, McAlpin, Tams, Glen White and Slab Fork. Eccles' returns arrived late. Had the votes of these locals been counted their vote would have stood 1007 for ratification as against 542½ for rejection; so the action of these unions would have been to swell the small majority in the other parts of the field. Of the 40 unions voting, 23 were for ratification and 17 for rejection. Of those favoring ratification, 12 voted unanimously. On the other side 11 were equally clear as to the right course of action.

With Her Liniments and Patches

The First-Aid Corps

By MICHAEL BERNARD

Written Expressly for COAL AGE

Always Swift and Always Ready

WHEN our youthful lives were pestered
With the boil that ached and festered,
And with gashes, bruises, scratches,
Blisters, burns and stings galore,
Mother soothed our wounded feelings
And accomplished wondrous healings
With her liniments and patches,
Like a first-aid corps.

SHE performed the dual mission
Of the surgeon and physician
Till we felt that she could handle
Any kind of cut or sore;
But, arrived at man's discretion,
We are forced to make confession
That she couldn't hold a candle
To the first-aid corps.

ALWAYS swift and always ready,
Calm, self-confident and steady,
Trained to shun the painful errors
Made by rescuers before;
Armed with bandage, gauze and lotion,
Filled with courage and devotion,
Grim disaster holds no terrors
For the first-aid corps.

ACCIDENTS like laceration,
Twisted limbs, asphyxiation,
Severed artery and bleeding,
And a half a hundred more,
Fail in modern times to frighten,
For the outlook's bound to brighten
When proficient help comes speeding
With the first-aid corps.

Editorials

Economic Utilization of Coal

The American coal operator of today is a thorough economist. There was a time perhaps when guesswork and the rule-of-thumb answered the purpose of carrying on his business. Fortunately that time is past, and the modern operator must know the facts and takes nothing for granted.

We have heard much in the recent past concerning the exhaustion of our coal measures, and "conservation of natural resources" has become a household word. Some people hold the view that we of the present generation are morally accountable to those that are to come after us for our profligate waste of the riches with which nature has endowed the world.

However ethical such a doctrine may appear and however high a literary polish may be given to the phraseology in which it is couched thinking people are of the belief that the present is ours to enjoy and that we should make such use of nature and her gifts as best to serve the present needs of humanity. Let the future take care of itself. Coming generations will have their problems as we have ours and will doubtless be able to solve them by ways and means quite as efficient as those which we employ.

We have long been accustomed to regard coal as a substance containing a certain number of British thermal units per pound, this heat being made available through chemical combination with a certain quality of atmospheric air. Coal has been and is now being purchased regularly on the basis of its heat content. A contract for fuel has been a balance between British thermal units upon one hand and dollars and cents upon the other. A ton of coal has meant so much heat and nothing else. It has been, and in large measure is still in the popular conception, a fuel and a fuel only—a storehouse of heat-energy which warms our homes, cooks our food, lights our buildings, hauls our trains, smelts our ores and drives our commerce to the four corners of the globe.

Within the comparatively recent past, however, man has learned that coal contains more than British thermal units; that a multiplicity of products useful in the arts and sciences may be recovered from the gases evolved in the process of coking. Furthermore, the heat, the principal constituent for which the coal is dug, remains practically undiminished.

Besides the coke and gas which may be employed advantageously for metallurgical purposes or for the generation of power, the tar, ammonia, benzol, etc., recovered in the process of coking frequently possess a market value almost, if not quite, equal to the original coal as it was delivered to the byproduct ovens.

In our present stage of development along economic lines, no one would venture the assertion that the utmost attainable has been reached. Development of the coal industry will proceed in the future as it has in the past, whenever and wherever such development and improvement will pay a reasonable dividend upon the capital necessarily invested.

The invested capital of production is increasing, but not so rapidly as is the cost of coal. Consequently the time may not be far distant when we may reasonably anticipate that, notwithstanding the high fixed charges of the by-product coking plant, we will no more consider burning raw coal for the sake only of the heat which is thus liberated than today we habitually eat wheat in preference to bread.

But this improvement in the utilization of coal will not come about as a measure of conservation. It will transpire rather from natural economic causes, such as the increasing cost of coal production and transportation. The products evolved will be many and varied, but their market value will be such that when the cost of the raw coal is properly proportioned, heat (or the primary product for which the coal is mined) will be little if any more expensive than it is at the present day.

*

The Have-Nots in California

California in 1913 had 35 coal miners and two operating coal mines, and it produced 24,839 tons of coal. It also at one time had a Special Commissioner of Mine Accidents who, once appointed, promptly muckraked the coal operators in other states than his own, not being able to find any at home, and made statements from which a competent technical mining man would have refrained largely because they were not true.

But California, being a revolutionary state, has not been satisfied with these services to the industry, but has recently memorialized Congress to inaugurate Government ownership of coal mines, the Assembly of the state showing a marvelous unanimity and voting for the resolution 49 to 5. Assemblyman Downing, a socialist of Los Angeles, introduced the bill.

The Sacramento, Calif., journalist who recorded the fact declares that the California legislature never did this before. It is its first offense apparently; let us hope it will be its last. The reporter declares that "the project calls for the supplying of citizens with coal at the cost-of-production price."

Herein is the goal of much of the present-day socialism—the abolition of profit. When, however, the government absorbs all the businesses of the world and runs them all without profit, when also all the sources of taxation are cut off because private ownership is at an end, shall we not long for some profits to build our plants, excavate our railroads and common roads and meet the constant needs for expansion? Everywhere we go we see evidences of profit—factories, bridges, docks, dwellings, tipples, power-houses and what not. Only where Indians and savages live are none to be found.

To seek an end of profits is nihilism and not socialism. We fear that the mild climate of the state has unbraced the Californians and made many of them disposed to policies which can end only in the death of civilization. And like the man who was asked where he preferred to have a carbuncle they declare they like best to have it on the other fellow. They would like to see the regulation of industry tried on the sister states.

A coal miners' organ quotes a diatribe by Scott Nearing, an instructor in political economy at the University of Pennsylvania and at Swarthmore College, Pennsylvania. In it he says:

> Is not the world beginning to realize that today the most sinister crimes against the ideals of Christ's religion are committed by the system of industry for profit?

If he will change *realize* to *imagine* we will agree with him. The world is truly beginning to believe that profits need an apology. But when we note that almost every improvement is derived from capital which is created by profit, then that profit becomes to us as dear as our homes, as indispensable as our means of employment. We know, when we reflect, that almost all construction is from the profits of some business somewhere if not of the business where the improvements are made.

⁂

Increasing Connellsville Coke Production

Iron and to a lesser extent metallurgical fuel are regarded as trade barometers. It is a well-recognized fact that when the steel mills of the land are busy other industries follow suit, and no man needs to go hungry if he is willing and able to work.

Metallurgical fuel such as coke is produced only about as fast as it is needed, and consequently its rate of production is an index to industrial conditions scarcely less sensitive and reliable than the manufacture of steel and iron.

During the past three months, or since the beginning of the present year, the production of coke in the Connellsville region has been steadily increasing. The first week in January saw about 200,000 tons of this fuel produced in that locality. At the present time the production is slightly over 280,000 tons weekly.

While many mines in the coke region have worked steadily for many months past, the majority have been on part time or closed down altogether. Many are now, however, either resuming operations after a shutdown or are increasing their capacity.

The reports from southwestern Pennsylvania have in the past few weeks been particularly encouraging. One hundred ovens have been blown in at Allison No. 2. The Ellsworth Colliery Co.'s works at Cokeburg and Ellsworth have been placed in full operation. The Marianna mine of the Pittsburgh-Buffalo Co. is working with 500 men. One hundred ovens were recently fired at Alicia, making 400 at that place. Reliance is operating 235 ovens six days per week; 35 additional ovens have been fired at the Century plant; 120 ovens were recently fired at Thompson No. 1 plant, making 400 in all, or the entire oven installation. Furthermore it appears to be the consensus of opinion that other plants will be starting within the next few weeks.

Whatever may have received the bulk of the blame for the present business depression, it would appear that one real cause of lessened prosperity lay in a lack of confidence. It would further appear that this lack of confidence is now vanishing and that better times are in store. While the wheels of industry are not turning as rapidly as they have sometimes done, their rapidity of rotation is at present increasing, slowly perhaps, but nevertheless steadily and surely.

State Mine Reports

Owing to the frequent changes in mine-inspection officials, the state mine reports are often less valuable and less readily usable than they should be. In the short tenure of office, the incumbents do not have time to observe, consider and correct the shortcomings of their reports. Some are, however, most complete, notably those of Pennsylvania, Illinois and West Virginia.

Every report should contain a preface stating the period which the report covers, the number of pounds in a ton, the inclusion or exclusion of mine managers, superintendents, clerks, safety bosses and firebosses in the enumeration of employees, the statement whether washery tonnages have reference to coal washed from culm banks only or to all coal received by such washeries, a declaration that coke-oven employees and strippers are or are not included in the enumeration of outside men and a statement showing which coal mines are recorded and which excluded and whether the coal output is supplemented by a clay or other noncarboniferous product at any of the mines the output of which is recorded. In this way false inferences will be avoided.

Then also all instructions given to those who fill the forms should be repeated here in full. The rules guiding the tabulating clerks should also be given. It is important to know, for instance, if the "number of days worked" is calculated as an average of the collieries taken as units or whether it is a weighted average and whether the weight is made dependent on tonnage produced or employees engaged.

Thus one tabulator might add the days worked at some 100 collieries and divide by 100. Another would multiply the tonnage produced by the days worked and finally add these products, dividing the sum by the total output. Another would take the products of days worked and men employed at each colliery, add these together and divide the result by the total number of employees. The last method is preferable to all others.

A list of the mine inspectors, the numbers and the geographic bounds of their districts would also be extremely valuable. Most of the reports omit one or more of the statements mentioned, and reference to the contents is thereby made difficult. One report on its cover even failed to record the name of the state to which the report referred.

It would be well if the nature of inquiries could be standardized in the various states so that results might be made more precisely comparable. Matters of this kind are well worthy of the attention of the Mine Inspectors' Institute of the United States of America.

⁂

A Profitable Season for the Retailer

The winter just closed has been a most satisfactory one to the retail dealers from the standpoint of profits, although the tonnage handled has been smaller. This is due to the fact that what coal has been shipped to the yards has been furnished at a minimum cost, including handling and hauling. Labor has been plentiful at less cost than in many seasons past, and the retailer has undoubtedly benefited on this score. The open winter has also permitted quick deliveries at a low cost, and the retailer has been able to buy his coal at the lowest prices in several years.

Discussion By Readers

Recognition of Bravery

Letter No. 11—I want to add a few words to what has already been said in regard to the recognition of acts of heroism in rescue work. I want to say, in the start, that I thoroughly believe that such acts of heroism and self-sacrifice in the mine warrant the same recognition as similar acts of bravery on the battlefield.

We read in our daily newspapers of the unselfish sacrifice of many lives in the European War. Men give their lives for the sole purpose of perpetuating the honor of their country and flag. These deeds are being enacted on the land, in the air, on the sea and beneath the waves. In many cases the actors face inevitable death. The same is true of the miner, with the difference that his acts are performed in the dark recesses of the mine away from public view. But the field of battle furnishes no greater danger than the mines, where rescue work often means "a race with death."

I am proud to say that in time of accident there are always men in large numbers willing, ready and anxious to go to the rescue of their fellows in danger. There is no spectacular display in this service, but trained men equipped with uptodate rescue apparatus and devices for resuscitating those overcome with gas enter the mine heedless of their own danger. Anything else would be cowardly and unworthy of a true miner.

Every precaution is taken in the training of men for rescue work. The apparatus is constantly inspected and kept in perfect working order ready for any emergency. The captain of the rescue team examines the apparatus twice a week. In addition to these precautions, in the event of an explosion, the rescuers wearing the apparatus, before entering the mine, examine carefully every part to see that the valves are in working order and the tanks fully charged with oxygen and that all unions and joints are gas-tight.

It is needless to say that these men recognize the dangers they are about to encounter. By all means their heroic work should receive recognition.

Mining Laws and Legislation

Letter No. 1—Referring to Mr. Hogarth's letter, Coal Age, Apr. 3, p. 613, regarding mining laws, etc., I wish to take issue with him in what he says about the need of the mine superintendent having a certificate, for two reasons.

The first reason is that the same line of argument could be extended to include the general superintendent, general manager and president, which would be impracticable. The same line of argument might be used also to show that because the superintendent, general superintendent or general manager is in authority over the mining engineer, master mechanic or electrician, he must in himself be all of these things.

The second reason is that one certificated official in charge of one job would seem to be enough; and the foreman, being in direct and immediate charge of the inside of the mine, should be that one. Also, it frequently happens that the superintendent is chosen as much for his executive ability as for his mining knowledge, and if he has sufficient executive ability to be a superintendent he will not insist on his foreman committing any act that would endanger the men under him; or doing so, he should be amenable to the law. The law must place the responsibility for the safe operation of a mine on some one person, and why not on the foreman?

If Mr. Hogarth's line of reasoning were followed to its logical conclusion the responsibility could not be placed on the superintendent on the ground that he must act in accordance with orders from his general manager; nor on the general manager, who must act in accordance with the orders of his president, and he in turn is controlled by his board of directors.

I do, however, agree with Mr. Hogarth in what he says about graded certificates for gaseous and nongaseous mines and with his suggestion that there should be more frequent inspection of the working faces with reference to roof and timbering conditions. I will even go further than Mr. Hogarth and suggest that in every mine the foreman should have sufficient competent assistants so that each working place shall be visited at least twice each working day by a competent person who shall have sufficient authority to see that the workmen properly protect and care for themselves.

Knoxville, Tenn.

The Layland Mine Explosion

Letter No. 1—In the issue of Coal Age, Mar. 27, p. 549, there appeared a criticism of the part taken by the federal Bureau of Mines in the rescue work at Layland, W. Va., following the explosion, Mar. 2, in the mine of the New River & Pocahontas Consolidated Coal Co.

Since the organization of the Bureau of Mines it or some of its officials have been the object of attack from men of the mining fraternity who should know better. Instead of handing out body-blows to the department at every opportunity afforded, these men should be their best friends and ardent supporters of the work the bureau was organized to perform. This would go far toward an early realization of the desired results; namely, to develop the most efficient rescue organization and, at the same time, carry on effective research work for the benefit of the men employed in the mine.

In regard to the criticism made in the Coal Age editorial referred to above, I want to suggest that if the federal rescue corps is open to criticism in this instance, the state inspection department is also worthy of the same charge. My purpose in writing at the present time is to point out the mistake of making a hasty criticism, which could be avoided by more mature thought.

All practical mining men know that the work of rescue in mines is often carried on under difficulties that render progress slow indeed. Such was the case in the Layland mine, where the haulage road was badly blocked by the débris resulting from the explosion; and the work of rescue, for that reason, had to be started and carried on through the air-course, until later when the clearing away of the wreckage made it possible to reverse the air current in the mine and enter by way of the main-haulage road.

As explained in Coal Age, Mar. 20, p. 509, the stoppage of the fan for the purpose of making this change in the circulation produced a decided change within the mine, which was shortly after noticed by the five men entombed behind an improvised stopping in the ninth-left entry. It did not take long for these five men, who had been well provided with food and water in their prison, to make their escape along the main-haulage road, under the changed conditions.

It is not claimed that either these five men or the remaining 42 men, for that matter, entombed behind two improvised stoppings in the tenth-left entry were rescued by the men who had labored so hard for nearly three days to accomplish this end. The rescue, if such it may be called, was the result of their own initiative; and yet the inference to be drawn from the criticism to which I have referred is that if the air was good enough for these men to walk out of the mine without the aid of helmets, it surely would have permitted rescuers to pursue their work of investigating those portions of the mine not yet reached. If this inference is merited, every man on the rescue corps should be awarded a leather medal.

It is not clear why the men on the staff of the bureau are subjected so often to special criticism, while the state mine inspector, who is naturally better acquainted with the local conditions and who is generally better paid for his service than men of the bureau corps, escapes such criticism. It should be recognized that more harm than good results from so doing. Messrs. Holmes, Rice and Paul, at the head of the rescue work of the bureau, have several times pointed out that the work of rescuing entombed men and the stoppage of mine fires is not regarded by them as a "secondary affair," as some miners and mine officials have assumed. It is this false idea of the bureau's work and aims that has led at times to unjust condemnation, because these men, trained to scientific work and methods, have refused to sacrifice their lives in what would prove, on more mature thought and the exercise of calm judgment, a futile effort. The fact is that, with all this caution on the part of a trained rescue corps, a greater percentage of the men engaged in this work have lost their lives than can be shown by the statistics of any other industry. This fact alone should answer any accusation of cowardice or indifference.

Fair Play.

Wheeling, W. Va.

Letter No. 2—I have been much interested in reading the account of the Layland mine explosion, Coal Age, Mar. 20, p. 508, which seems, however, to give undue credit to the rescue men of the state and federal departments. The account shows that 54 men in all escaped from the mine. Of these, seven owe their lives to the work of the hastily organized local rescuers, under the lead of General Manager Bertolet. My purpose in writing is not to cast any reflection on the heroic work of any class of mine rescuers, who certainly earn the right to all the credit due them. I only desire to rehearse a few facts of which I have personal knowledge, having engaged for a considerable time in the work of rescue at this mine.

The explosion occurred Tuesday morning, Mar. 2, shortly after the miners had started work at the face. The damage caused by the explosion has been previously described, but the general plan of the mine may not be thoroughly understood. The Layland mine or mines consists, practically, of a pair of main tunnels, running along the face of the mountain, a few hundred feet under cover. Cross-tunnels are driven into the hill off this main tunnel, and these cross-tunnels or entries form practically separate mines known as "No. 3 mine," "No. 4 mine," etc. There were 13 butt-entries turned to the left off the haulage road of No. 3 mine. The distance on the main tunnel, from No. 3 mine to No. 4 mine, is 2400 to 2600 ft. There were nine butt-entries driven to the left off the haulage road of No. 4 mine. No. 6 left entry, in No. 3 mine, is cut through to the No. 4 mine air-course. The main tunnel extends a few thousand feet beyond the mouth of No. 4 mine, and butt-entries are turned off this main tunnel, inby of that point. The face of the main tunnel is considerably higher in elevation than the face of No. 3 mine.

It was but a short time after the explosion occurred that the seven men referred to in the article in Coal Age walked out of the mine. These men had worked in No. 4 left entry, in No. 3 mine.

The fan had been disabled and put out of commission by the force of the explosion, but repairs were quickly made and the fan started again. The first efforts of the local rescuers were to establish a current of air in No. 3 mine, as they were of the opinion that more men were still alive in that time. They soon had the air conducted along No. 3 air-course to the sixth-left entry, which was cut through to No. 4 mine, as previously stated. The mouth of the sixth-left entry, in No. 3 mine, was 1200 to 1500 ft. from where the men were entombed, as was developed later. Up to this time the local rescue party had been led by a superintendent of the New River & Pocahontas Consolidated Coal Co.

It was about this time that the state officials arrived on the scene. Following a short conference, it was decided to abandon the idea of further exploring No. 3 mine at that time, and the men were withdrawn and started to explore the workings of No. 4 mine, advancing as rapidly as possible along the left air-course of the main tunnel. This work had the effect to reverse the air in No. 3 mine, which was soon filled with the return air from No. 4 mine, the intake to No. 4 being now conducted through the main-tunnel air-course to those workings.

This condition of the circulation in the mine continued from Tuesday night until Friday night, when the fan was stopped, as has been stated, for the purpose of reversing the air current in the mine, in order to make it possible to explore further the workings in No. 3 mine. The fan was stopped from about 12:30 Friday night until about noon Saturday, by which time all the entombed men were out of the mine.

As has been stated, about 8:15 Saturday morning, while the fan was stopped, to the surprise of everyone five miners walked out of No. 3 mine with their lighted carbide lamps on their heads. They stated that they had come from the ninth-left entry in No. 3 mine, in which entry they had barricaded themselves shortly after the explosion occurred. They stated, further, that 42 men were still in the tenth-left entry in the same mine, where they had gone immediately after the explosion to barricade themselves in a similar manner.

It is true that rescuers at once proceeded into the mine to find the 42 men reported to be in the tenth-left entry. They found these men and assisted them out. The fact remains, however, that the men could have come out themselves, in the same manner as the five men who preceded them from the ninth-left entry. They would have done this probably in another hour had not the rescuers appeared in the meantime. The escape of these men from their entombment should therefore not be credited to the rescue work, but rather to their own cool judgment and self-possession in barricading themselves in these entries and not attempting to escape from the mine immediately after the explosion occurred, in which attempt they would undoubtedly have perished.

It is fortunate, indeed, that the Layland mine was not a gaseous one, or there would have occurred a second explosion when the entombed men came out with their open lights. This would have proved a serious matter as there were then from 50 to 75 rescuers in the mine. Having recited these facts of my own observation I am willing to allow all readers to judge for themselves where credit belongs.

One of the Rescuers.

——, W. Va.

When Should Rescue Work Be Abandoned?

Letter No. 1—The editorial that appeared some time since in Coal Age, Jan. 9, p. 90, entitled "When Should Rescue Work Be Abandoned?" attracted my attention. The question of rescue work has always appealed to me very strongly by reason of its seriousness and importance.

The question of how far rescuers are justified in risking their own lives in the attempt to save others will always meet with a variety of opinions among mining men. For myself, I want to say emphatically that I am of the opinion that rescue work should *never* be abandoned as long as there is the remotest chance to get into the mine and until the last man has been rescued or accounted for.

The history of coal mining is replete with instances where entombed miners have been rescued days after the occurrence of the explosion that made them prisoners in the mines. In a few instances these unfortunate men have found their way out through the Stygian darkness of the mine and have come unassisted to daylight, safety and home, after they had been given up as lost. Such instances will be repeated from time to time in the annals of coal mining yet to be written.

There is manifested, too often, the tendency of mining men when reviewing the results of rescue work following a great mine disaster to criticize the actions of those who had charge of the work. This criticism is offered after the true conditions that existed at the time in the mine had become fully known. The story of rescue has been read, as it were from an open book, with all the knowledge that subsequent investigation has made available. The fact is ignored that the rescuers at the time knew nothing of the conditions prevailing in the workings, the location of the men whom they hoped to save or the possibilities of their own chances of success and safety. All of this information now clearly revealed had then to be judged by meager facts and experience, in the excitement of the moment when the fate of fellow-workers rested on instant and wise action.

In this connection I recall the words of Sir Thomas Holland, referring to the tragic death of W. H. Pickering, H. M., mine inspector, who sacrificed his life in the attempt to rescue any possible survivors of the first explosion in the Cadeby main colliery, of July 9, 1912. Mr. Holland remarked:

> It is easy to be wise after the event; it is easy apparently in the comfort of an office chair to criticize the wisdom of more experienced men; but we often fail to distinguish between the conclusions which were justified by the facts before the rescuers at the time and those which are developed later. . . .
>
> Fancy Pickering sitting at the surface estimating the risks of another explosion while his fellows were dying below! Doubtless if the rescue party had been restrained long enough, in this case as in similar cases, they could have proved the futility of an attempt, as the men would then have been dead.
>
> But the deeds of men like Pickering and Scott are worth more than lives; through their deaths the spirit of the race lives, for to this world a brave man dying in the face of danger is worth more than ten cowards living and carefully counting the costs.

The keynote of rescue work is a high degree of courage without recklessness. For this there should be selected men of strong physique, known courage and superior natural intelligence. Their motto should be, "Save the lives of others, if possible, even at the cost, perhaps, of our own."

In closing, I want to quote one verse from Berton Braley's poem entitled, "The Boys of the Rescue Crew," which appeared in Coal Age, Vol. 4, p. 685. It reads as follows:

"By day or night
It's theirs to fight
With death itself in view,
And they face their fate
With hearts elate,
The boys of the Rescue Crew!"

Longwall in the Pittsburgh Seam

Letter No. 5—There is only one way in which the No. 8 seam of coal in the eastern Ohio and the Panhandle district of West Virginia can be worked on the longwall system, and that is by the adoption of the *longwall-retreating* plan. If the capital invested will permit of driving the entries to the boundary lines of the property and longwall work be then started at that point, on the retreating system, I believe the work would undoubtedly prove successful.

It has long been the custom for Pennsylvania mining men who have migrated into these districts to hold up their hands in holy horror on being informed that from 45 to 50 per cent. of the coal must be left in the ground. When these men start to operate the mines in these districts, they immediately begin to devise plans for extracting the pillar coal. In many cases, they start recovery work on a splendid scale. They procure a couple of dozen good pick-men and for a period of from two to six months the work of recovery booms.

At about this time, however, by an inexorable rule, it is found necessary to rush timber, cement and other material into the mine to build cribs to control the squeeze that has set in and threatens to close the mine. This condition may continue for a couple of months longer, when the company gives up the idea of being able to recover the pillar coal, and the man with the big idea of "pillar recovery" is forced to hunt another job—an older and a wiser man.

It is not strange that a mining man used to a fairly good recovery becomes heartbroken when he is obliged to leave these pillars and stumps required for the successful working of the No. 8 seam in these districts. But let them take the advice of one who has tried, and *let it alone.* In working this seam the fact has to be learned by hard experience that the soft shale underlying the hard limerock will not permit the "gradual settlement" that has been claimed by longwall advocates in this discussion.

As far as I have been able to learn, this limerock has not been broken in eastern Ohio or in the Panhandle district of West Virginia. Another fact that must be learned in respect to the working of this seam is that the slate over the coal cannot be used to build the packwalls required in the longwall system. The nature of this slate is such that it air-slakes and crumbles to pieces in a few days, before it is possible to complete the brushing of the roof necessary to keep the roads open in longwall work.

Notwithstanding all these facts, I believe longwall *can* be introduced and successfully conducted, on the retreating plan, in both of these districts; but the man who attempts to work the longwall system in any other way will lose out so quickly that he will not know how it happened.

I would like to see a retreating plan of longwall submitted, in the pages of Coal Age, that would be adapted to the working of the No. 8 seam in eastern Ohio and the Panhandle district. I am convinced that if these discussions are continued practical results will follow, and a good plan will be developed that will avoid the deplorable loss of coal in the working of this seam. With the present plan of working this waste of coal is apparently unavoidable, but every effort should be made to stop such waste, by the adoption of a plan that will be feasible and practicable, in the operation of coal mines.

O. P. Rator.

——, Ohio.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

INFLAMMATION AND EXPLOSION OF GAS

Theory of Inflammation—The inflammation of a combustible gas involves, at least, two main conditions that are essential to the reaction. They are as follows:

1. The presence of another gas that will **support the combustion** by reason of the different affinities of the elements of the gases that invite dissociation and recombination to form other compounds.

2. A **rise of temperature,** at the point of contact of the two gases, sufficient to start the reaction.

The ignition of a combustible gas in some cases (carbon monoxide) requires, besides the above, the presence of **water vapor.**

Temperature of Ignition—At the same pressure and under the same conditions of ignition, the temperature at which a given gas inflames or the temperature of ignition for that gas **is fixed.** The following table gives the average temperatures of ignition, as determined by experiment:

AVERAGE TEMPERATURES OF IGNITION OF COMBUSTIBLE GASES IN NORMAL AIR

Gas	Symbol	Temperature of Ignition (Deg. F.)
Carbon monoxide..........	CO	1240
Methane	CH_4	1212
Ethane	C_2H_6	1140
Ethene (olefiant gas)......	C_2H_4	1124
Hydrogen	H_2	1077
Acetylene	C_2H_2	970

The Nature of Flame—Flame, as here considered, is burning gas. It may be **luminous** or **nonluminous,** according to the presence or absence of carbon either free or combined as hydrocarbons. The incandescence of the carbon particles when present renders the flame luminous. This is the case with most oil-fed flames and flames burning in a dusty atmosphere. The flame of hydrogen burning in clear, pure air is practically nonluminous. Methane produces an almost nonluminous flame, but the flame of the heavy hydrocarbon gases is always more or less luminous.

The Temperature of Flame—The temperature of flame is variable, owing to numerous conditions that affect the combustion of the gas both as to its **rapidity and completeness.** The temperature will vary in different parts of the same flame, because of a variable supply of air that not only affects the combustion of the gas but absorbs much of the heat developed and lowers the temperature of the flame.

Owing to these varying conditions it is clearly impossible to calculate the actual flame temperature of a burning gas. This is often roughly assumed to be about one-half of the **theoretical value** as calculated from the heat of combustion per pound of gas and the heat absorbed by the corresponding products of combustion, for each degree rise in temperature.

It is important not to confuse the **flame temperature** of a combustible gas with its **temperature of ignition,** as they have no connection with each other.

The Coal Age Pocket Book

Influence of Temperature on Explosion—A rise of the initial temperature of an explosive mixture slightly extends the lower inflammable limit, but has no appreciable effect on the higher limit, owing to the small relative value of the increase as compared with the high temperature developed in the explosion.

Influence of Pressure on Explosion—Pressure exerted on an explosive mixture increases its **power to absorb heat** and thus renders it more readily ignitable. In other words, an increase of pressure lowers the lower inflammable limit of an explosive gaseous mixture. An increase of pressure, by increasing the **velocity of propagation** of the explosion in the mixture, raises the temperature developed and extends the higher inflammable limit. In other words, an increase of pressure **widens the explosive range** of a combustible gas.

Influence of Relative Humidity on Explosion—While the presence of moisture (water vapor) in a gaseous mixture is often necessary to secure its explosion, as explained in reference to carbon monoxide, the water vapor absorbs much of the heat and lowers the temperature developed, thereby reducing the **rate of combination** and the **force of the explosion,** except where fine coal dust is suspended in the air, when partial dissociation may take place in the water vapor and result in increasing the energy of the reaction.

Influence of Catalysis to Cause Explosion—Catalysis is the effect produced by a foreign substance to assist chemical reaction between two other substances, while the substance itself undergoes no change—first discovered by Berzelius. Much differenec of opinion exists as to the suggested **catalytic action** of fine incombustible dust suspended in mine air, to assist the explosion of combustible gases. Finely powdered **stone dust** has been shown to retard the ignition of coal dust by mixing with and diluting the latter. This effect, however, is wholly physical and not related to the possible catalytic action referred to by Sir Frederick Abel and others who have studied the subject closely.

Influence of Character of Initial Impulse—The manner in which the gas is ignited or the character of the initial impulse determines largely the explosion of gaseous mixtures. For example, a firedamp mixture ignited by a **lamp flame** may not explode, while if fired by the flame of a **blownout** or **windy shot,** the greater volume and intensity of the flame may cause an explosion.

The **volume of the flame** is important, because it envelops a larger portion of the gaseous mixture and ignition is thus started generally throughout the mass, causing a greater development of heat and reducing the percentage of loss by radiation, convection and conduction.

The **intensity** of the initial impulse or the higher temperature of the igniting flame will often cause the explosion of a gaseous mixture that would burn quietly if ignited by a less intense source of heat energy. The dissipation of heat is so rapid and general in a burning gas that the transition from **inflammation** to **explosion** requires a conservation of heat or greater local energy than can often be realized in the large open workings of a well-ventilated mine.

Inquiries of General Interest

Shipment and Transportation of Coal

I would appreciate answers to the following questions:

1. Is it true that the loss of coal from steel coal cars while in motion and, particularly, by theft when the cars are standing on sidings at stations is sufficient to cause any material loss to shippers?

2. Are there standard specifications for use in constructing steel coal cars? If so, can you give me the dimensions required and the details of construction generally included in such specifications.

3. What is the clearance between the top of cars and coal chutes or loaders at the mine and at coal bergs? Can these chutes, as a general rule, be raised and lowered to accommodate cars of different types?

4. How is the coal distributed in the cars when loading; does the chute swing from end to end of the car so as to distribute the coal evenly, or is the coal distributed by manual labor?

5. Kindly mention a list of the principal coal companies shipping coal to market and give any data that may be available showing losses in transit between shippers and distributors of coal.

A. L. Wyman.

Ridgefield Park, N. J.

Replying to these questions in the order in which they are given, it may be stated that—

1. The shrinkage of coal shipments, in transit, is the result of several causes that vary in different localities and under different conditions of preparation of the coal for shipment. These losses are no greater in the use of steel coal cars than where wooden flats are employed. The loss is very much decreased by the use of box cars, for the reason that there is less loss by the drying out of the coal in transit and by theft while standing on the siding, since these cars are closed and sealed before the shipment is made.

The shrinkage of the shipping weight is sometimes only *apparent,* due to imperfect weighing of the coal either at the point of shipment or at the destination. A *real* shrinkage may be due to the drying out of the coal, which is often shipped from the mine in a wet condition, or to actual loss by falling off the cars when the coal has been improperly loaded; or it may be occasioned by theft while the cars have been standing on the siding or, as sometimes happens, the coal is taken from the cars for use on engines when the regular supply runs short. The loss by theft is always greater in the cold seasons of the year. These losses are all variable and cannot be accurately estimated.

2. Different railroads have different standard requirements regulating the dimensions of cars for different shipping purposes. The details of construction are determined by contract of the manufacturing company with the engineering department of the road for which the cars are made, or by the specifications furnished by that department to their own shops. An interesting table giving the limiting dimensions for different styles of cars and railroads was published in Coal Age, Vol. 6, p. 462.

3. A clearance of 4 or 6 in. is generally allowed between the top of the coal as loaded on the car and the bottom of the loading chute. Some railroads have regulations specifying the height to which coal can be loaded above the top of railroad flats. In this connection, an interesting article, giving the instructions issued by the St. Louis & San Francisco R.R. to coal shippers on its lines, appeared in Coal Age, Vol. 4, p. 747. The instructions provided, in that case, for a height of 26 in. from the top of steel cars to the top of coal. For wooden cars this height was reduced to 20 in.

In general, loading chutes are stationary and cannot be raised or lowered. In many cases, however, a movable apron is provided at the bottom of the chute that can be raised or lowered a few inches.

4. There are numerous appliances for distributing the coal evenly in the car when loading. The most of these are adapted to the loading of box cars, which present the difficulty that all the coal must be run into the car through the center door. Some of these loaders employ a chute that can be run into the car and turned so as to throw the coal into either end. In other forms of loaders, the platform on which the car stands when being loaded is tilted so as to throw the coal first to one end of the car and then to the other. For a more even loading of flat cars and to avoid the breaking of the coal, a special loading boom has been designed by the Roberts & Schaeffer Co. that can be raised and lowered as the coal is piled in the car. This loading boom has a shaking motion that assists the coal in sliding down the chute.

Loading chutes are not arranged to swing from one end of the car to the other when loading flat cars, but even distribution of the coal is effected by letting the car down on the track as the coal is loaded, the loading beginning at the lower end of the car. Manual labor is now only employed for distributing or "chunking" the coal when loading box cars and for trimming the top of coal flats ready for shipment.

5. Some of the largest shippers of coal, in different states, are as follows:

Tennessee Coal, Iron & R.R. Co., operating in Alabama and Tennessee; Colorado Fuel & Iron Co., operating in Colorado; New Staunton Coal Co.; the Superior Coal Co.; Bunsen Coal Co., operating in Illinois; Delaware, Lackawanna & Western R.R. Co., Lehigh Valley Coal Co., Lehigh & Wilkes-Barre Coal Co., Lehigh Coal & Navigation Co., Pennsylvania Coal Co., Delaware & Hudson Co., Susquehanna Coal Co., all operating in the Pennsylvania anthracite region; Pennsylvania Coal & Coke Corporation, Pittsburgh Coal Co., Consolidated Connellsville Coke Co., all operating in the Pennsylvania bituminous district; Consolidation Coal Co., Cabin Creek Consolidated Coal Co., Pocahontas Consolidated Collieries Co., all operating in West Virginia.

No tables are available showing the specific losses of coal in transit between shippers and distributors of coal. Information in this regard can be best obtained by applying directly to coal distributors.

Examination Questions

Alabama First-Class Mine Foremen's Examination, Held Jan. 25-28, 1915

(*Selected Questions*)

Ques.—Where shots are being fired in mines producing large volumes of explosive gas what precaution should be adopted in firing the same?

Ans.—Under these conditions, all shots should be fired by competent and authorized shotfirers after the men have withdrawn from the mine. A thorough and efficient system of inspection of all holes drilled in the coal should be employed. These holes should be charged and fired by the shotfirers, who should have authority to refuse to charge and fire any hole that in their judgment is unsafe. It would be an advantage to use only permissible powder. Each place should be examined for gas before a shot is fired therein. The firing should begin on the "end of the air" and proceed slowly against the current, time being given for the air to sweep away the gases and dust produced by the shooting.

Ques.—Specify the conditions that must be fulfilled in order to secure good ventilation in a mine employing a large number of men.

Ans.—The mine should be divided into separate ventilating districts and a limited number of men allowed to work in each district. The air should be regulated so as to proportion the amount to the requirement in each district. The air in each split should be conducted in such a manner as to sweep the entire working face before passing into the main-return airway. The ventilating power must be sufficient to supply the required quantity of air for the mine.

Ques.—What are the causes of falls of roof, and how would you make an inspection to determine the security of the roof in a coal mine?

Ans.—The immediate cause of a fall of roof is the removal of the coal from beneath without providing any adequate support by timbers or packwalls. The presence of slips or faults in the roof strata induces sudden and unexpected falls of the roof. Roof falls are often caused by gas pressure in the strata or by squeezes and movements in the roof following the extraction of the coal. Driving too wide openings or leaving insufficient pillars induces falls of roof. Much depends, however, on the nature of the roof strata and the method of working employed and amount of timber used.

The roof in a mine must be carefully inspected to detect any slips or fault-lines or a weak or jointed condition of the roof. It is usual also to sound the roof by tapping the slate or rock with the butt end of a pick handle or other implement. Experience is required to sound a roof in this manner and determine its security.

Ques.—What dangers arise from the use of electricity in mines, and what methods would you employ to prevent accidents therefrom?

Ans.—The chief dangers are the liability of shock to men and animals by coming in contact with live wires, also the ignition of gaseous mixtures that may accumulate in the mine, or the ignition of combustible material by the sparking of wires, brushes and switches, or the blowing out of fuses, or the breaking of wire conductors.

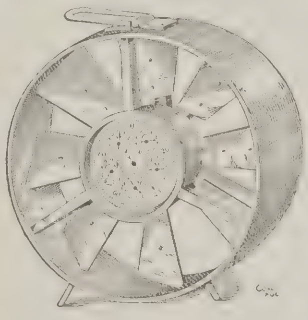
To prevent these accidents as far as possible, suitable danger signals should be displayed at all points in the mine where men are liable to receive a shock. All electric installations should be made by a competent electrician, and switchboards and other electric appliances should be carefully guarded. Live wires should be well insulated whenever possible. Men should not be permitted to travel on haulage roads where electric haulage is employed, and trolley wires should be suitably protected at all points where it is necessary for men or animals to cross such roads. The entire electric installation should be carefully inspected every day by a competent man.

Ques.—What percentage of relative humidity would you consider necessary in a dry and dusty mine?

Ans.—Inasmuch as the absorption of moisture by the air does not increase rapidly for a rise of relative humidity above 70 per cent. and since 60 per cent. presents a healthful condition of the atmosphere at ordinary temperatures, it would seem advisable to endeavor to maintain a relative humidity of the mine air, varying from 60 to, say, 75 per cent.

Ques.—Describe the anemometer and state its use in connection with mine ventilation.

Ans.—The form of anemometer generally employed in mining practice is that known as the "Biram anemometer." As shown in the accompanying figure, this consists of a metal ring within which is poised a rotating vane, the blades of which are inclined to the plane of rotation. The air current striking the inclined blades rotates the vane, the number of revolutions being recorded on the face of the dial by means of a series of gears. The instrument is so calibrated that each revolution of the vane corresponds to 1 lin.ft. of air travel. This instrument is employed to measure the velocity of the air current in mine airways as expressed in feet per minute. It is important, however, to hold the instrument so that the vane revolves in a plane perpendicular to the direction of the current.

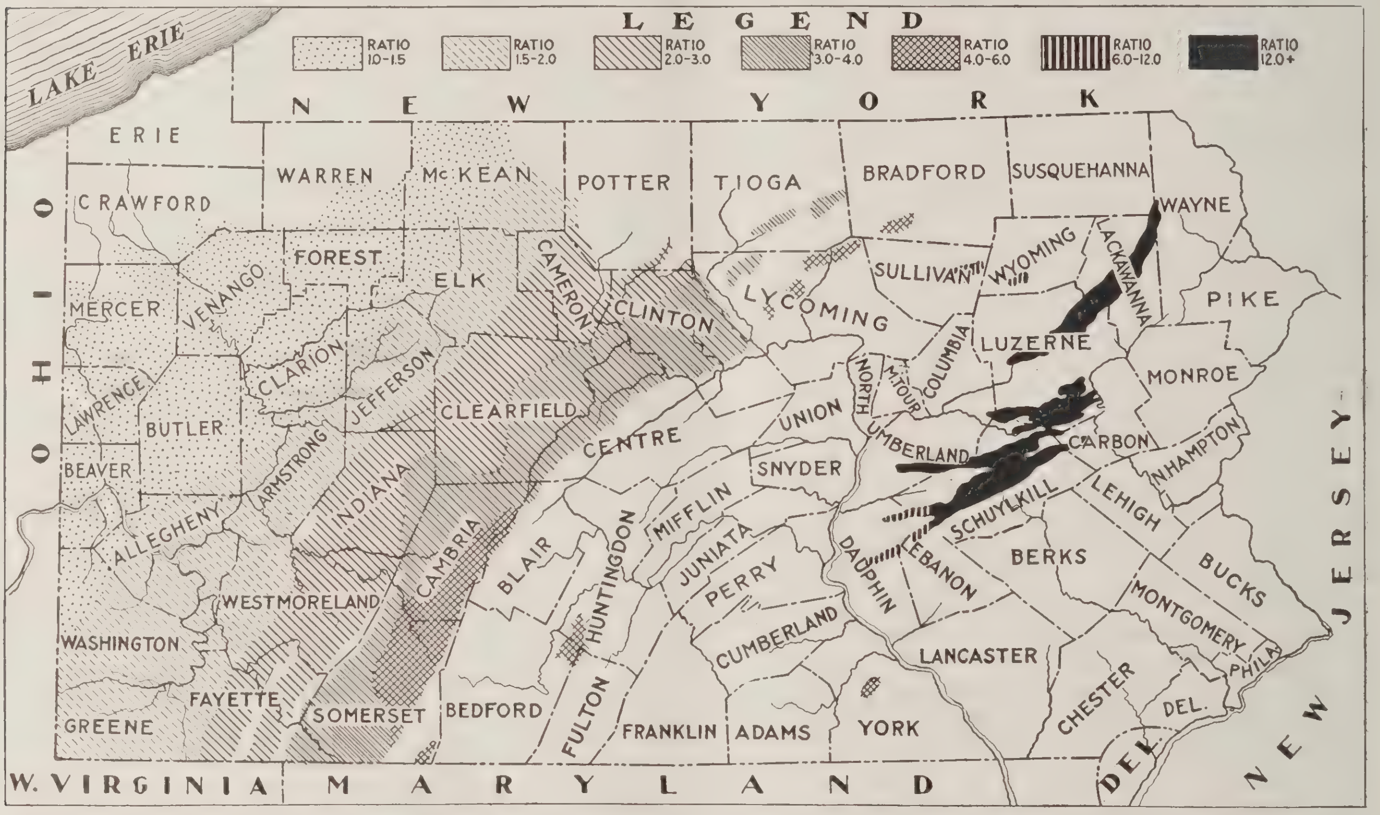


THE ANEMOMETER

Ques.—Is it safe to pass a current of intake air through the abandoned portions of a mine and then conduct it to the face of the workings?

Ans.—No. The intake air should be conducted at once to the working face before being permitted to pass through abandoned workings. Otherwise the gases accumulated in the abandoned workings would be swept by the air current onto the men working at the face, and this would menace both the health of the men and the safety of the mine.

Book Reviews



Map of Pennsylvania Showing How the Percentage of Volatile Matter in the Coal Varies with Its Location in Relation to the Great Appalachian Uplift

MINERALS OF PENNSYLVANIA, REPORT NO. 9, Topographic and Geologic Survey Commission of Pennsylvania, 1913. By Amos P. Brown and Frederick Ehrenfeld. Richard R. Hice, state geologist. 143 p. + 16 p. index. 6x9⅜ in. 10 plates and 1 fig. Cloth boards. For public distribution.

An alphabetically arranged account of the minerals found in Pennsylvania, included somewhat broadly under this list being buhrstone, grindstone, millstones, allanite, amphibole, pyroxene, asbestos, barite, beryl, brick, cement materials, chromite, clay, coal, copper, corundum, cyanite, epidote, feldspar, fluorite, garnet, natural gas, glass materials, glass-pot clay, gold, granite, graphite, greenockite, iron, lead and zinc ores, limestone, lime and cement rock, magnesium and manganese minerals, marble, marl, mica, mineral paints, molybdenum, tungsten, nickel, cobalt, petroleum, phosphate minerals, potash and saline minerals, salt, pyrite, marcasite, quartz, serpentine, shales, silica, silver, slate, strontium minerals, talc, titanium minerals, tourmaline, trap, uranium, radium minerals, and zircon.

We rejoice to see that the proof reading is much improved over that of last year's report. This year the volume is in this manner more worthy of the state which publishes it.

Coal receives 16 pages and 5 cuts, one of which we reproduce. On page 56 reference is made to the "Reynolds and Walton" coking coal. In case the people who live in that section fail to realize that they are listed as coke producers we will state that "Reynolds" should be "Reynoldsville" and "Walton" "Walston." The Pittsburgh district strange to say, does not get a number, though it is mentioned.

The descriptive matter is quite one-sided. Too much is taken from the reports of a few of the quadrangles, but otherwise the information is well chosen. A good cross section showing the order of the beds if not their thickness would have been helpful.

To enable readers to understand the map we republish, we will say that the fuel ratio is obtained by dividing the percentage of fixed carbon by the percentage of volatile hydrocarbons. It is a relation existing in the pure coal and has nothing to do with the impurities. The map illustrates in an excellent manner the editorial which appeared in our issue of Jan. 16 of this year entitled "Coal Beds and Their Characteristics." In this editorial we pointed out the fatuity of attempting to judge the character of a coal from its geological horizon. Its position geographically is equally important in many cases. For the readers' advantage we have calculated the following table showing the practical meaning of the fuel ratios to which reference is made in the map.

ANALYSES CORRESPONDING TO CERTAIN FUEL RATIOS

Fuel Ratio	Ash and Moisture	Fixed Carbon	Volatile Matter
12.0	0.00 Pure Coal	92.31	7.69
12.0	6.00	86.77	7.23
12.0	8.00	84.92	7.08
12.0	10.00	83.08	6.92
6.0	0.00 Pure Coal	85.72	14.29
6.0	6.00	80.57	13.43
6.0	8.00	78.86	13.14
6.0	10.00	77.15	12.86
4.0	0.00 Pure Coal	80.00	20.00
4.0	6.00	75.20	18.80
4.0	8.00	73.60	18.40
4.0	10.00	72.00	18.00
3.0	0.00 Pure Coal	75.00	25.00
3.0	6.00	70.50	23.50
3.0	8.00	69.00	23.00
3.0	10.00	67.50	22.50
2.0	0.00 Pure Coal	66.67	33.33
2.0	6.00	62.67	31.33
2.0	8.00	61.33	30.67
2.0	10.00	60.00	30.00
1.5	0.00 Pure Coal	60.00	40.00
1.5	6.00	56.40	37.60
1.5	8.00	55.20	36.80
1.5	10.00	54.00	36.00
1.0	0.00 Pure Coal	50.00	50.00
1.0	6.00	47.00	47.00
1.0	8.00	46.00	46.00
1.0	10.00	45.00	45.00

Thus a coal having impurities of ash and moisture of 10 per cent. and a fuel ratio of 1.5 would have a fixed carbon percentage of 54 and a volatile matter percentage of 36.

Coal and Coke News

Washington, D. C.

President Wilson has acted upon Secretary Lane's recommendations relative to the choice of a route for the new Alaskan line, and in so doing he has brought the Alaska coal controversy of such long previous standing considerably nearer to a definite status. The order relating to the line and its route was signed on Saturday, Apr. 12, and designates the Alaska Northern R.R. as the first link in the Government line, the existing road to be bought by the Government and then extended up the Susitna Valley to Fairbanks, a total of 471 miles from Tidewater at Resurrection Bay. There will be according to the present plan a branch 38 miles long into the Matanuska coal field.

The latter field is to be opened and exploited, it being understood that the navy coal tests resulted in favor of the coals of the Matanuska field. Believing, however, that the coal of the Bering River field is also good, further tests have been ordered and will be made with a view to constructing a line to open up these deposits as well as the others.

Many coal claims have been filed in both fields and an effort is being made to dispose of these claims as fast as possible and close them up by passing upon their validity. The decisions that are being handed down will probably clear up the titles to the coal that have been in doubt since the days of the Ballinger controversy and by the time the branch line is open it will be possible to make new entries in accordance with law. The Government expects to reserve for its own use 5000 acres of the best coal land, thereby providing a supply for the navy. Many expect that within a year or two, it will also be possible to supply Pacific Coast ports with Alaska coal in commercial quantities.

The Alaska Northern is to cost the Government $1,150,000, and the construction of the new mileage is to be made in sections by contract. The work will be in charge of the Alaska Engineering Commission which will have charge of the letting of the contracts and the conditions of work generally. It is believed that the region to be opened will be available for settlement and agriculture as well as for mining.

A Supreme Court Decision

The Supreme Court of the United States has made public the complete text of the opinion lately handed down in the case of the Pennsylvania R.R. Co. vs. the Puritan Coal Mining Co. As has already been announced, the decision of the upper court is in support of the decision of the Supreme Court of Pennsylvania which held that the plaintiff in the lower court (the coal company) was entitled to recover damages due to unfair distribution of coal cars by the road. The decision as now published, however, throws new light on the outcome and offers some important points not previously given much attention.

The main facts in the case were shown to be as follows:

Usually the carrier was able to furnish shippers with cars on demand; but in 1902 there was a strike in the anthracite region which cut off the usual supply of anthracite coal to Eastern cities and compelled them to use bituminous coal mined along the lines of the Pennsylvania Ry. The new demand for soft coal was so great that the railroad company was not able to supply the full number of cars called for by the mining companies on its line. Its established rule in such cases was that cars should be allotted to the several coal districts in proportion to their output, the cars thus allotted to the districts being then distributed to the mining companies there in proportion to their capacity. During the anthracite coal strike, however, the carrier violated this rule and made excessive allotments to the "scalp level region," in which the Berwind mines were located, and made too small an allotment to the "mountain region" in which the Puritan mines were situated.

There was evidence that the Puritan company had orders for coal at a price which would have netted it a large profit. The coal so ordered was to be delivered "free on board" the cars at the Puritan mines—the purchaser and consignee paying the freight to points of destination within and without the state. There was evidence that the Puritan company was ready, willing and able to make such sales and deliveries and constantly demanded cars in order to enable it to fill these orders. Sometimes the carrier for days would fail to furnish cars, with the result that the company's mining operations were seriously interrupted. Sometimes the Puritan got cars but not the full number to which it was entitled on the basis of distribution according to mine capacity, although the Berwind-White Co. during the same period received more than its proportion.

In the lower court there was a total judgment for the coal company amounting to $74,323.88. The railroad company took the case to the Supreme Court, urging that the lower court had erred.

(1) In holding that the state court has jurisdiction.

(2) In failing to hold that under the Commerce Act the Federal Court alone had jurisdiction.

(3) In holding that the business between the Puritan company and the railroad was intrastate business where coal was sold f.o.b. the cars at the mines.

(4) In holding that the plaintiff could recover damages for failure to receive cars intended for use in shipping coal outside the state.

(5) In adopting the method for distributing cars on which the damages were collected.

(6) In failing "to take into account the private or individual cars, socalled, which were delivered to the plaintiff during the period of the action in determining the number which it would have been entitled to receive of the additional cars which the court has found should have been allotted to the region or district in which the plaintiff's mines were located."

When the railroad company appealed to the Supreme Court of the United States from the verdict as thus handed down, it urged that:

(1) The determination of the proper basis for the distribution of cars was a matter calling for the exercise of the power of the Interstate Commerce Commission; (2) that no court had jurisdiction of a suit against it for discriminatory allotment until after the Commission had determined that its rule for distribution was improper; and (3) that no suit for damages against an interstate carrier could be brought for damages occasioned by a failure to deliver cars or for an unjust discrimination in distribution except in a United States Court.

In passing upon these matters the Court turns first to the question of jurisdiction under the Interstate Commerce Act and holds that the act in question "did not supersede the jurisdiction of state courts in any case, new or old, where the decision did not involve the determination of matters calling for the exercise of the administrative power and discretion of the Commission; or relate to a subject as to which the jurisdiction of the Federal courts had otherwise been made exclusive."

It then goes on to consider whether suits relating to discriminatory acts be confined to state courts. As to this "it must be" says the court's opinion, "borne in mind that there are two forms of discrimination—one in the rule and the other in the manner of its enforcement; one in promulgating a discriminatory rule, the other in the unfair enforcement of a reasonable rule. In a suit where the rule of practice itself is attacked as unfair or discriminatory, a question is raised which calls for the exercise of the judgment and discretion of the administrative power which has been vested by Congress in the Commission. It is for that body to say whether such a rule unjustly discriminates against one class of shippers in favor of another. Until that body has declared the practice to be discriminatory and unjust no court has jurisdiction of a suit against an interstate carrier for damages occasioned by its enforcement. When the Commission has declared the rule to be unjust, redress must be sought before the Commission or in the United States courts of competent jurisdiction as provided in section 9."

As to the claim that private cars should have been reckoned in and considered in determining the proper car apportionment the court finally concludes that:

Probably because of the carrier's own rule of distribution, there was no pleading raising such an issue, and there was no sufficient evidence as to the number of private cars received by the Puritan, the Berwind-White, or other companies. The information on that subject was peculiarly within the knowledge of the carrier and proof adequate to furnish a basis for the contention should have been offered—if, indeed, the carrier could have been heard to insist that private cars should have been counted when its own rule, as well as the general practice in the United States, was to exclude them in calculating the number of coal cars to which each mine was entitled. Neither need we inquire whether the fact that the Commission subsequently announced a rule, under which private cars had to be taken into account in making the distribution, could be given a retrospective effect. For, be that as it may be, the exception was properly disallowed, because, as held by the Supreme Court of Pennsylvania, no relevant evidence was offered to support the contention, and no point was raised during the trial, that private cars should be counted in the distribution.

HARRISBURG, PENN.

In a rather emasculated condition the Catlin Bill No. 160 was on Apr. 7 reported out of the Mines and Mining Committee of the Senate.

There are but three sections in the bill left intact. The principal one is that allowing an attorney for a victim of a mine accident to appear at the coroner's inquest. A slight amendment is inserted regarding the definition of a miner and as the bill now reads "any person competent to do the work of a miner" goes into the class of miners.

The section prohibiting the use of gasoline engines in the mines so as to prevent accidents from white damp is eliminated entirely, as is that compelling a man to work five years at the face cutting coal before being qualified to become a foreman.

The section pertaining to workmen's compensation is amended so that a company may go outside of the mine foreman class to select a foreman, but adds that a mine cannot be operated without a certified mine foreman. This the miners claim is a direct contradiction. The words "equally as competent" have been inserted.

The mine workers have asked that the interpretation of Attorney John G. Johnson as to what law is necessary to bring miners under compensation be incorporated in the Catlin bill, and this has been agreed to.

Representative Hugh L. Dawson, at the request of the attorney-general, introduced a bill on Apr. 7, providing that mine foremen and their assistants in and about the coal mines of the state shall be agents and employees of the operators of such mines, and shall be employed and discharged as are other agents and employees, and that operators shall be responsible for the acts and neglects of such mine foremen and their assistants as in the case of other agents and employees, and notwithstanding the employment of such mine foremen and their assistants, and shall at all times be under the supervision, management and control of such operators.

Representative Schaeffer has introduced a bill that no person under the age of 18 years shall be employed in any capacity whatever in or about any of the anthracite coal mines of the state for a longer period than 8 hours out of each day of 24 hours.

A bill to amend the act of 1911 providing for the powers, etc,. of sealers of weights and measures, so as to include instruments and devices for weighing coal has been introduced by Mr. Dodds.

Mr. Hess, chairman of the Committee on Mines and Mining in the House, has introduced a bill which provides that the governor shall have the power to appoint a board of five men to hold examinations for mine inspector in the anthracite region and do away with the district boards. The governor is to make the appointments during the month of June, two of the members are to be engineers, and three miners. The board is to meet in Harrisburg on the second Tuesday in July following its appointment to prepare questions and answers, and on the fourth Tuesday in July examinations are to be conducted in Harrisburg.

Candidates must not be under 35 nor over 60 years of age. The governor will have the power to appoint any person who has received a percentage of 90 or over. The inspectors named during 1915 shall serve until Dec. 31, 1915 and the inspectors elected or appointed under the act of 1901 are to serve until Dec. 31, 1915, after Jan. 1, 1916, the term of all inspectors shall be for four years. In the case of a vacancy the governor is to appoint the person having the highest percentage of those who have received over 90 per cent. The anthracite district is to be divided into 25 inspection districts instead of 21 as at present.

PENNSYLVANIA

Anthracite

Hazleton—Flooded since 1899, although rich with virtually untouched veins of anthracite coal, Stockton mines, which are one mile from here, will be thrown open to operation again. The new tunnel to be driven from Hazleton to Butler Valley will tap the water in the Stockton workings.

.It is reported that miners driving a rock tunnel at the Drifton colliery of the Lehigh Valley Coal Co. recently struck a thick bed of anthracite in a portion of the workings which were on the verge of abandonment. This discovery signified a considerable lease of life to the mine which has been in steady operation since 1863.

Shenandoah—The Mine Inspectors' Examining Board of Schuylkill, Northumberland, Dauphin and Columbia counties, examined 17 candidates for mine inspector on Apr. 6 and 7. There are 7 vacancies to be filled at the November election, but all candidates must have a certificate of eligibility before their names may be placed on the primary ballots. Mine Inspectors A. B. Lamb, P. C. Fenton, J. A. O'Donnell, B. I. Evans, P. J. Friel, John Curran and Charles J. Price, whose terms expire, are all candidates for reëlection and took the examination.

Pottsville—The Philadelphia & Reading Coal & Iron Co. through its counsel, on Apr. 8, made a legal fight in court to have dissolved the injunction preventing it from using the water of the Little Schuylkill River, for its collieries and locomotives. The company anticipates another severe drought like that of last year, and declares that it will be absolutely necessary to use this water. The water company contends that the Reading violated its charter in its furnishing water to the collieries of the Lehigh Coal & Navigation Co., from the river, whereas its charter only entitles it to furnish it for domestic purposes.

Plymouth—Several hundred men on Apr. 7 refused to work and declared a strike because the foreman prohibited them using the slope in going to or from their work. It being a violation of mining laws to trespass on slopes, the men must use the manway provided for that purpose, but this they refuse to do unless the company dampens the dust with which it is laden and kept in continuous circulation by mules which use the same passage in getting to the work of the vein.

Wilkes-Barre—At a conferencé recently held in this city it was decided to hold the Tri-District Convention of the United Mine Workers to formulate their demands to be presented to the anthracite operators at the expiration of their present agreement in this city on Sept. 7. It is thought that an increase of about 20 per cent. in wages will be asked.

Bethlehem—Navigation on the Lehigh Canal between Mauch Chunk, Bethlehem, Easton and Philadelphia was recently brought to a standstill by a strike of boatmen who demanded more money for conveying the coal from the mines to tidewater. Forty-three boats were at one time tied up at Walnutport alone.

Bituminous

Connellsville—The Connellsville coke trade shows a slight decrease, the production and shipment approximating 280,000 tons during the present week. There has been a marked increase in merchant production, the decline being due to decreased furnace demand. A sale of 40,000 tons of Pocahontas furnace coke for delivery, 6000 to 7000 tons per month for the next six months, is reported. This is the only transaction of importance in Southern coke in some months.

WEST VIRGINIA

Fairmont—At a meeting of operators from all sections of the state held here for the purpose of taking action to protect the industry against unwarranted legislative attacks, it was indicated that action may be taken looking toward the establishment of uniform prices for the product, graded in a proper manner. The evils of unrestricted competition and of price-cutting were pointed out, and the obvious remedy suggested. No agreement which might have the effect of making the proposed price basis illegal will be entered into, something on the order of the present circular plan being contemplated.

Heberton—The Willis Branch Coal Co., Thomas K. Laing, president, made its first shipment of coal a few days ago. This company is mining the Eagle Seam of the Kanawha measures and expects to produce between 4000 and 8000 tons per month

KENTUCKY

Lexington—Students from all parts of Kentucky and some from West Virginia have matriculated in the practical miners' course which has opened at the State University here. All the classes are well filled.

Domino—The Himyar Coal Co. here has increased the output from 600 to 1200 tons daily and is now running every day in the week. Louis Des Cognets, manager of the operation, has just returned from the Northwest, where he secured some good-sized orders, so the plant will run regularly for some time.

Hazard—The Hazard Coal Co. made a record run one day recently, 15 cars being loaded. A little later the company expects to fill that number every day in the week.

Ashland—Because several stockholders were absent from the meeting recently held at Ashland where arrangements for the consolidation of several companies as the Kentucky River Coal Corporation was to have been perfected, the meeting was postponed. Some of the details also had not yet been arranged.

OHIO

Columbus—A death rate of three to every million tons of coal mined in Ohio in 1914 is reported by the State Industrial Commission, the figures being 59 deaths, to 18,500,571 tons of coal mined during the year, or one death to each 313,569 tons of coal. There were 162 deaths in 1913, but the difference is largely due to the general idleness in the eastern Ohio field during 1914.

Upon his own motion, Senator Vorheis, author of the bill pending in the Ohio legislature, seeking to regulate coal rates in Ohio killed the measure. So much opposition to the bill developed that its friends did not want to bring it to a vote. Operators also lost the bill providing that all state institutions shall use Ohio coal only.

A bill has been introduced in the Ohio legislature appropriating $6000 for the state mine department to establish "first aid" schools and stations at various mining camps. A portion of the money, if appropriated, will be available for the operation of the mine rescue car.

Belleaire—The resumption of the payment of strike benefits to miners in the eastern Ohio field occurred a few days ago, after a suspension of several weeks. Miners receive $3 a week, women 50c. and children 25 cents. Community gardens are being prepared, for the purpose of enabling the men to get through the spring and summer as economically as possible, although it is rumored that a settlement on a 47-cent basis, run-of-mine, is being discussed by one of the large companies.

INDIANA

Linton—Prospects seem good in the Linton coal field for the summer months. Business is about up to the April average and in addition the Vandalia Coal Co. is to sink a new mine just south of this city while the Gould Co. has its 500 acres southwest of the city to open up.

Terre Haute—William Houston, who has retired as president of the Indiana Mine Workers, Henry Pigg, member of the executive board, and others have organized the Ohio & Indiana Collieries Co. and will operate a large coal stripping plant near Jasonville, Ind., which has been in operation about three months. There are 400 acres in the property.

UTAH

Salt Lake City—Application for an injunction to prevent the transfer of the Castle Valley Coal Co.'s holdings to the United States Fuel Co. in connection with the recent $10,000,000 merger of four Utah coal properties was recently filed with the clerk of the United States District Court. The complaint set forth that by the carrying out of a resolution adopted by the board of directors of the Castle Valley Coal Co. on Mar. 13, 1915, holders of the company's stock will be forced to liquidate and accept in lieu of their stock shares in the United States Fuel Co. It is maintained by the plaintiff that this is unfair to the holders of stock that voted against the adoption of the resolution at the stockholders' meeting on Mar. 30, 1915, held in Evanston, Wyo.

FOREIGN NEWS

Tokio, Japan—Three hundred miners were buried alive by a cave-in that wrecked the interior of a colliery near Shimonoseki, Apr. 13. The entrapped miners are 700 ft. below the surface and it is believed that their rescue is impossible.

PERSONALS

Jonathan Bryan, of Richmond, Va., recently paid a visit of inspection to his properties in the Birmingham, Ala., district.

James H. Cassidy was recently removed by Federal Judge John H. Clarke from the receivership of the Cleveland & Pittsburgh Coal Co. Carl C. Friebolin was appointed in his place.

W. H. Cunningham has bought the interest of C. R. Conner in the engineering firm of which they were members, and will practice as a consulting mining engineer and geologist in Huntington, W. Va.

J. B. Whitnall, president of the Pennsylvania Coal & Supply Co., of Milwaukee, Wis., resigned on Apr. 10 on account of ill-health. He will continue to serve on the board of directors. Frank S. Peabody, of Chicago, was elected as his successor.

F. P. Wright, of Bevier, Ky., was recently reëlected president of the Western Kentucky Coal Operators' Association. C. W. Taylor, of Central City, was named vice-president and D. Stewart Miller, of Owensboro, chosen secretary and treasurer.

A. F. MacKennon, for 16 years superintendent of the Pennsylvania Coal & Coke Corporation, has severed his connection with that company. Mr. MacKennon has not yet announced his plans for the future, but anticipates taking a trip through the South shortly.

Charles Finley, of Williamsburg, Ky., president of the Proctor Coal Co., operating in Kentucky and Tennessee, has taken options on a large body of coal land in the Hazard, Ky., field and is having the same prospected, with the idea of buying and developing it at once if the prospects prove satisfactory.

B. J. Rowe, coal traffic manager of the Illinois Central R.R., recently testified in the Interstate Commerce Commission hearing of the Western freight rate case that more reductions than increases in the freight rates on soft coal would result from the Western railroads' proposed readjustments of rates on certain commodities.

Milton H. Smith, president of the Louisville & Nashville R.R. Co., and a number of the directors of the road recently concluded an inspection trip over the new Winchester-Irvine extension of the road. Freight has been carried over the road for a month or more and it is hoped that passenger traffic may be begun in the near future.

S. B. Warriner, president of the Lehigh Coal & Navigation Co., Attorney Thomas D. Shea, of Nanticoke, and State Labor Commissioner John Price Jackson were recently selected as a board of arbitration to settle the strike of the Wilkes-Barre street railway employees. Pending the decision of this board, the employees have returned to work.

L. P. Johnson, of Wallins Creek, Ky., recently resigned his position as superintendent of the Wallins Creek Coal Co., to take part in the organization of a new coal company which will soon open up a new mine in the Harlan field in Kentucky. Mr. Johnson expects to spend the present month in traveling before assuming his new duties.

L. D. Kniffin, sales manager of the Sheridan Coal Co., lately spent a few days at the company's mines in Paris, Ark., and in southern Kansas. He reports that only a small quantity of steam coal is now being taken from the mines and that otherwise everything is running in good shape. There is something of a shortage of steam coal on the local market.

Lynn W. Searles, mining engineer, of Birmingham, Ala., has been appointed consulting engineer for the Deepwater Coal & Coke Co., with headquarters at Evansville, Ind. This company is a syndicate formed to take over a large number of operations, in the western Kentucky field in the vicinity of Henderson, Uniontown and Morganfield, and furnish river transportation for them.

J. M. Roan, state mining inspector of Ohio, gave an examination to 21 applicants for the position of deputy mine inspector in Columbus, Apr. 9 and 10. Since the positions are under civil service all appointees must take the civil service examination. There is one vacancy in the service, in No. 4 district, and the appointment will be made as soon as the eligible list is completed.

Barney Day, of the Sanford-Day Iron Works Co., of Knoxville, Tenn., has assumed the indebtedness of the Dean Coal Co., of Artemus, Ky., which was recently placed in the hands of a receiver, and has taken over the mine, which he will put in operation at once. This property contains 6 ft. of the Dean seam of coal which is being worked, besides carrying the Jellico seam. It is understood that Mr. Day will offer the property for sale, as he is not a coal operator, and does not aspire to that honor.

John Mayer, president of the Mayer Coal Co., has been in southeastern Kansas for several days superintending the development of new mines. At Rabley the company is building one of the largest mines in the state and claims that it is one of the most up-to-date mines in America, since all the material used in the construction is steel. The mine is on the Sante Fe R.R. and the company expects to be operating it in three or four weeks. The mine will eventually have a capacity of 1000 tons daily.

INDUSTRIAL NEWS

Lorain, Ohio—The Baltimore & Ohio dock at this port will start loading coal on or about May 1. The steamer "D. J. Morrell" is fitting out and will be ready to sail at that date.

Pittsburgh, Penn.—The Wilson-Snyder Mfg. Co. of Pittsburgh, Penn., has opened a branch office at 52 Vanderbilt Ave., New York City. This office will be in charge of A. H. Sherwood.

Washington, D. C.—Rates on bituminous coal from mines in Illinois and Indiana, to St. Paul and Minneapolis over the Chicago & Alton and other railroads were found not unreasonable Apr. 10, by the Interstate Commerce Commission.

Lexington, Ky.—It is estimated that the Lexington & Eastern R.R. extension of the Louisville & Nashville, when present improvements are finished, will be able to handle about 10,000,000 tons of coal annually from the Elkhorn field in Kentucky.

Hazelton, Penn.—Contractor Lawrence Carey has a force of men engaged in driving a tunnel in the No. 23 slope at Tresckow. This tunnel is being pushed with all possible speed, and when completed will develop a large body of coal chiefly in the thinner measures.

Columbus, Ohio—J. M. Roan, Ohio mine and safety commissioner, has issued Bulletin A-4, dated Mar. 30. The bulletin takes up every fatal accident for the year 1914 and gives the causes in detail. The effort is made to teach other miners to avoid such accidents in the future.

Columbus, Ohio—The Hocking Valley R.R. Co. has appealed the case where the Ohio Utilities Commission ordered the company to resume electric service on the branch between Wellston and Hamden to the Supreme Court of Ohio. A bond of $5000 was given by the railroad company to appeal.

Charlestown, W. Va.—A petition in voluntary bankruptcy has been filed by the Hughes Creek Coal Co. The liabilities are placed at $125,373.16 and the assets at $150,162.56, the petition was filed by James Kay, president of the company, after the Board of Directors had met and decided that the company was insolvent.

New Orleans, La.—The "Captain Bud," the new $50,000 tug built at Dubuque, Iowa, for the Bisso Towboat Co., which is managed by the New Orleans Coal Co., arrived in New Orleans recently and has been put in commission on the Mississippi and has made an important addition to the Bisso fleet.

Washington, D. C.—It has been informally announced that the Federal Trade Commission will make an early investigation into conditions in the Indiana and Illinois coal fields. Operators in these fields have been pleading with the Commission for its advice as to the best method for conducting their business in order to escape prosecution under the provision of the Sherman Anti-Trust Law.

Bismarck, N. D. — New lignite coal rates in North Dakota may be made on a basis that will be in the nature of a compromise between the rates established by the Legislature and declared confiscatory by the Supreme Court, and the rate formerly maintained by the railroads. Pending an anticipated conference between state and railroad officials, no steps are being taken by the railroads in the matter of establishing new lignite coal tariffs.

Dante, Va.—On June 26, 1914 the Clinchfield Coal Corporation awarded a $50,000 contract to the Roberts & Schaefer Co. for the designing and building of a fireproof coal tipple at mine Nos. 2 and 5, similar to the one installed at Hurricane, W. Va. Just after the outbreak of the European war, the directors of the coal company suspended operations on this contract. They have now, however, authorized the immediate completion of this new plant.

Fairmont, W. Va.—The first trial growing out of the Farmington strike riot began here Apr. 12, before Judge W. G. Haymond, of the Circuit Court and Dock Urich, a Croatian miner, was called by the Commonwealth to answer a charge of the murder of Constable W. R. Riggs. One hundred and thirty-four men in all, are charged with murder, conspiracy to commit murder and riot. The trials of the other men are scheduled to follow that of Urich.

Trenton, N. J.—The Central R.R. of New Jersey was fined $200,000 in the U. S. District Court on Apr. 5, for granting rebates to the Lehigh Coal & Navigation Co., for the shipment of coal from Nesquehoning, Penn., to points in Pennsylvania, New York and New Jersey. Sentences on 25 counts of an indictment of 185 counts on which the railroad was found guilty were imposed. An appeal will be taken by the railroad to the U. S. Circuit Court of Appeals.

Charleston, W. Va.—Figures showing the March shipments over the Chesapeake & Ohio R.R. indicate a gain of 85,655 tons over the preceding month, gains in the New River and Kentucky fields being responsible for the increase, as the Kanawha and Guyan districts both showed decreases. As compared with March, 1913, the movement was 157,000 tons less, the Kanawha output being only about half as large this year as last.

Washington, D. C.—Work on the new Bureau of Mines plant adjoining Schenley Park in Pittsburgh will be started in the near future. The Treasury Department announced on the afternoon of Apr. 10, that the contract for the construction of the main building had been let to the George W. Will Co., of New York, whose bid was $287,540. The contract for grading and excavating the site was awarded to the C. A. Riffle Co., of Pittsburgh, the price being $27,242.

Norton, Va.—Work was recently started on the government building which is to be used for a post office and federal mine rescue station and to cost $90,000. It will be erected on the site formerly owned by the Norton Grocery Co. The building will be one of the most expensive and handsome structures in southwest Virginia. A United States mine rescue car with its crew will be stationed at this building for use in the southwest Virginia coal fields. It will be several months before the structure is completed.

Cincinnati, Ohio—The United States Circuit Court of Appeals has affirmed the judgment of $125,000 in favor of Mrs. Jean D. McKell recently handed down by the district court, against the Chesapeake & Ohio Ry. Co. This is the fourth time the case has been decided by the appellate court, and is the first time the judgment of the lower court has been sustained. The case was instituted by the late Thomas G. McKell, banker and coal operator, in 1902, and damages to the amount of $3,575,000 were demanded from the railroad company by reason of its alleged failure to carry out an agreement for the development of West Virginia properties.

Toledo, Ohio—A new coal-car dumper, costing $360,000, will be put in service shortly by the Cincinnati, Hamilton & Dayton R.R. at Toledo. This is the first time a machine as large as this, with necessary extension to docks, has been constructed during winter weather. The new machine will pick up bodily a 75-ton car loaded with coal and dump the entire contents into a vessel returning the car to its track. It will handle cars of this size at the rate of 40 per hour. The Cincinnati, Hamilton & Dayton handled at Toledo for shipment by Lake to the Northwest during the 1914 season more than 2,000,000 tons of coal.

Washington, Penn.—A proceeding was recently instituted by George S. Harah, of Uniontown, to save from sacrifice the properties of Altha L. Moser, for whom Harah is receiver. Moser owns large coal holdings in this county and the court handed down a decree in which it was ordered that the exemplification of the record in Fayette County be filed among the equity records of this county. The outstanding obligations of Mr. Moser are placed at $300,000, of which $48,000 is personal indebtedness and unsecured. He owns 152 acres of coal in Washington County and 706 acres in Greene County. He also holds real estate in Pittsburgh and farm land in Fayette County.

St. Louis, Mo.—In the Supreme Court in New York City recently a decision was handed down that will be of interest to coal men in the Middle West. It was in the case of Robert Holmes vs. the directors of the St. Joseph Lead Co., in which the judge overruled the demurrer of E. C. Smith, vice-president of the St. Joseph Lead Co. and president of the Central Vermont R.R., and ordered that the case go to trial. This is a case of where the plaintiff demands that the directors sue certain coal companies in the Middle West that substituted Standard coal on Carterville coal contracts, causing the lead company to lose several hundred thousand dollars.

Shamokin, Penn.—An interesting and important case affecting the miners of this section was recently heard before Justice Heslop. The question involved was whether a contractor or the mining company is responsible for the pay of the men employed on a mine contract. A few months ago Louis Randall took a contract at the Colbert colliery. The work was more rifficult than he had anticipated, and he did not make sufficient money on the contract to pay his employees the full amount of their wages. The men appealed to the company for pay which was refused. It is claimed that the operator or mining company is responsible for the pay of the men if the contractor fails. Justice Heslop upheld the contention of the workmen and entered a judgment in favor of the plaintiff for $40. It is understood that this case in the form of a test suit will probably be appealed from the justice's decision in order to get the court's opinion on the question.

Johnstown, Penn.—As a sequel to the purchase by John D. Rockefeller of a controlling interest in the Consolidation Coal Co., an important trackage agreement has just been concluded between the Baltimore & Ohio and Western Maryland railroads, whereby the latter will gain access, with comparatively little construction work, to two coal fields off its present lines, and will share in the tonnage of a third field. It is estimated the Baltimore & Ohio's revenues will be affected to the extent of between $700,000 and $800,000 annually by the new arrangement. It will receive a rental for the use of its tracks. The coal fields involved in the competition for tonnage are in the Somerset and Fairmont districts. The Pennsylvania R.R. is already in the Somerset field and the New York Central recently completed a joint line into a portion of the Fairmont field. The future increase in production in these important fields may be the object of much more active competition than now exists.

Coal Trade Reviews

General Review

Anthracite trade active in all departments. Improved sentiment in bituminous though movement continues light. Less tendency to force the market and contract prices are fair. Unfavorable outlook in Lake trade a depressing feature.

The anthracite trade is shaping up in better form than anticipated, and the market will have no difficulty in absorbing the maximum production throughout the current month with the possible exception of some of the steam grades which are showing a tendency to drag. Shipments to Down East points are going forward as rapidly as the barge fleets can move. The general demand is undoubtedly less than normal which is due, in part, to the fact that collections are so slow that dealers are unable to purchase as heavily as usual. Shipments in the Lake trade will be slow in getting under way because of the large ice fields in Lake Erie. In the Middle West the demand is somewhat stronger, and the tonnage will closely approximate that of previous years.

There are undoubted indications of an improved undertone in the bituminous situation though the market continues irregular and rather mixed. Current prices undoubtedly rule slightly under the 1914 level, but there is less distress coal being forced on the market, and it is a significant fact that no particularly low bids are developing on any of the large public contracts, while there is a growing disposition to wipe out the differential over last year's prices. There is less tendency on the part of the operators to force the market, and the more cautious buyers are showing a greater interest.

The poor outlook in the Lake trade continues to exert a depressing influence in the Pittsburgh district, and buyers are still adverse to committing themselves on contracts, preferring to take their chances in the open market; they evidently plan to hold off contracting until late in the fall when they will endeavor to cover their requirements so as to insure a supply during the active period, occasioned by the possibility of a general suspension Apr. 1. Domestic coal has ceased to be a factor in the situation, but the steam demand has increased slightly though it is still substantially below the average.

The usual between-season dullness prevails in the Ohio market though there is a slightly better undertone. Coal is beginning to move towards the Lakes, but chartering is slow and it is clear that there will be no shipments of importance before July 1. What little demand there is centers entirely on slack coal, the supply of which is much curtailed as a result of the restricted mining operations.

In the Middle West the domestic coals have been more buoyant due essentially to the generally cool weather though some of the agencies are inclined to interpret this as an indication of an upturn in the trade. An improved sentiment is noted in the prompt market which is causing buyers to show more interest in contracts, and the steam coals are somewhat steadier. Mining operations are now on about the usual summer basis, and there is less free coal on the market. Unusually favorable crop reports are creating an improved sentiment in this section.

BUSINESS OPINIONS

Bradstreets—This week's reports, trade and industrial, are the best noted for some time past, being in some respects the most favorable received since the spring of 1914.

Dun's Review—Influences favoring business are now more numerous and potent and there is unmistakable trend toward expanding activity. In certain lines conservatism continues the controlling policy and thus there is some irregularity, with the aggregate of transactions below producing capacity, trade development naturally being subject to the changes and checks produced by the international crisis.

Financial Chronicle—The performances now being witnessed on the Stock Exchange cannot be viewed with unconcern. The element of artificiality in them is altogether too patent to be ignored. The improvement in the situation is being used as the lever for boosting prices with a dazzling recklessness. If one may judge from Stock Exchange records, manipulation is the governing factor in the speculation. Many of the stocks which have been taken hold of and whirled up so furiously must be assumed to have considerable intrinsic merit, but their worth remains to be tested, and in the meantime future prospects are being discounted with a freedom that staggers the beholder. The movement has now been continued for several successive weeks; and with each succeeding day the manipulators have been getting more bold, until it seemed as if, frenzied by success, they had now completely lost their heads, and become possessed with the idea that there was no limit or bound to which their daring and recklessness might not go without risk of ill-consequences.

Boston News Bureau—If general trade has not improved to a point that indicates enlarged wants and buying power, it is certainly in a position that warrants more hope and cheerfulness. There is a better undertone prevailing everywhere, and this is gradually changing sentiment and causing an inclination to expand. If the crop outlook continues promising, we shall probably see a quickening of activity from coast to coast. The time will come when the country will feel the effects of the economy which has been such a potent factor in the affairs of both corporations and individuals.

American Wool and Cotton Reporter—A duller season in the wool market for the last 25 years is not recalled, and the reason ascribed is the retrenchments made in the expenditures for clothing. This applies to the domestic business, of course, for Government orders have created an abnormal situation. If it were not for the foreign trade many mills would be idle.

The Iron and Steel Industry—The production of pig iron in March amounted to more than 2,000,000 tons, the highest record since May of last year. It is at the rate of 75% of the pig iron capacity of the country. Unfilled orders decreased 90,000 tons in March as compared with 350,000 tons in the corresponding month last year; the total unfilled orders now aggregate 4,200,000 tons. Foundry iron business has been slightly better. The automobile makers in Detroit took about 10,000 tons, and there have been other sales of merchant iron. Stocks of foundry iron decreased rapidly in March, and undoubtedly took care of the increase which piled up during January and February. Finished steel products are not in so good demand. There is quite a little heavy work, notably bridge work, which has come out within the last fortnight.

ATLANTIC SEABOARD

BOSTON

Pocahontas and New River prices fail to show expected weakness. More hopeful tone. Contract demand slightly improved. Georges Creek and Pennsylvania grades quiet at tide. Water freights easier. Anthracite being shipped freely.

Bituminous—Prices on Pocahontas and New River are holding better than was expected. Recent bids on public contracts show no particularly low figures and there is more of a disposition on the part of shippers to accept the situation as they find it and not to try to force coal on a reluctant market. At the distribution points for inland delivery supply is still in excess of demand. Cargoes are absorbed very slowly. Only a few season orders are being placed now, and those mostly in the same channels as last year. Prices for the year on a delivered basis are usually found to be somewhat under the 1914 level.

The market for Georges Creek is not much improved. The shippers are very actively canvassing for business but prices are being held along the usual lines. The unfavorable weather has tended to retard arrivals and there has therefore been somewhat less pressure to move cargoes this week.

Cambria and Somerset coals are quiet at Tidewater but are still aggressive in the all-rail territory. New England is being thoroughly combed over for new business but buyers are rather unresponsive. Prices on these grades show small concessions as compared with a year ago.

Boston retail dealers reduced the current price for bituminous this week from $4.65 to $4.40 per short ton for delivery by team. This is the lowest current price for more than two years and is the result of friction between some of the larger distributors.

Water Freights are easier, if anything; 80c. has been quoted on barge transportation, 3000 tons upwards, Hampton Roads to Boston, and the same figure still prevails on bituminous in anthracite barges from Philadelphia; 40c. is the current rate on barges from New York to Providence, 700 tons and up.

Anthracite—Shipments are coming forward as fast as the barge fleets can move, although some of the smaller dealers have already taken on all they can receive for the present. All the regular shippers are well supplied with orders for April, but May is expected to be slower. That some of the individual shippers have coal here on the market only serves to emphasize 1915 as a notably easy year to get anthracite forward on minimum prices.

Current quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.90@1.40	$1.15@1.60	$1.67@1.77	
Philadelphia*	2.15@2.65	2.40@2.85	2.92@3.02	
New York*	2.45@2.95	2.70@3.15	3.22@3.32	
Baltimore*	....	....	2.85@2.95	
Hampton Roads*	....	....	....	$2.60@2.75
Boston†	....	....	....	3.55@3.73
Providence†	....	....	....	3.50@3.73

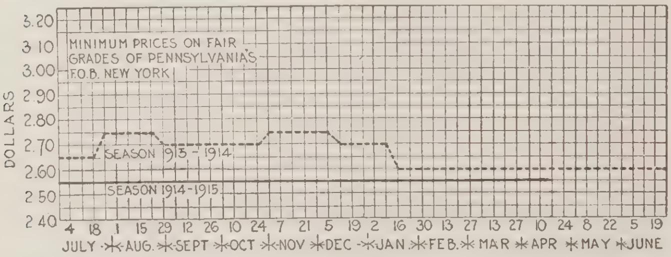
* F.o.b. †On cars.

NEW YORK

The situation on new bituminous contracts regarded as favorable. Improved sentiment in the trade. Anthracite more active as the month advances. Summer outlook more optimistic.

Bituminous—Now that the religious holidays are over and the men back at work, coal is beginning to come forward again on a more uniform basis and a considerable tonnage is being moved over the piers, relieving any immediate prospect of demurrage conditions such as existed during March and before.

Reports from the leading soft-coal distributors indicate that contracts have been closing up in encouraging fashion, nearly all of last year's business being accounted for and at fair prices, equal in many instances to those which prevailed during the season of 1914-1915. Some concessions have been made to secure the business of a certain element which usually seeks to set its own prices but this is a small percentage of the whole. It can truthfully be said that general conditions are improving and that the spirit of optimism which has become evident in the trade is but a natural reflection of the general business improvement so noticeable in financial circles. The market is now quotable on the following basis: West Virginia steam, $2.35@2.55; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.05@3.10; Georges Creek, $3.15.



Anthracite—With the collieries working full time again the usual tonnage is now being produced, with sufficient orders from the retail dealers to absorb each day's output. As the last half of the month approaches the activity seems to become more pronounced, the retailers being eager to get under cover for as much coal as possible at the April circular. From present indications the retail trade will not be able to make all the deliveries now on their books during this month.

Whether those who last month predicted April prices to prevail in the summer feel the same now is questionable, for there is no apparent desire to await that time. This prediction may be verified but it is most unlikely as the fear of labor troubles at the expiration of the present agreement hangs heavily over the situation and will become more ominous as the season advances.

Egg and stove are about in equal demand. Chestnut is moving easily but is not so active as the former two sizes. Pea is active apparently for filling in apartment houses, which business is always heavy at this season. The buckwheats are in good demand and No. 2 buckwheat in the better grades is really short with loading delayed for several days. There is no doubt that these sizes will be the leading factor in a lively market which will characterize next fall and winter.

The anthracite market is now quotable on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$4.60	$4.60	$4.55	$4.55
Egg	4.85	4.85	4.80	4.80
Stove	4.85	4.85	4.80	4.80
Chestnut	5.10	5.10	5.05	5.05
Pea	3.55	3.35@3.55	3.50	3.15@3.50
Buckwheat	2.80	2.60@2.80	2.50@2.75	2.35@2.75
Rice	2.30	2.30@2.40	2.00@2.25	2.10@2.35
Barley	1.80	1.60@1.80	1.75	1.40@1.75

PHILADELPHIA

Outlook on anthracite favorable for balance of month, although small sizes are weak. Domestic grades in good demand. Bituminous inclined to drag, with no prospect for immediate improvement.

Anthracite—From the present outlook, there is likely to be little or no difficulty in disposing of the output of the domestic sizes for the balance of the month. Operators report a distinctly better attitude on the part of the trade, which indicates that the dealers are rapidly disposing of the surplus carried over from the winter months, and are in the market for fresh supplies. The steam sizes are likely to hamper operations as the warm weather approaches, as the demand for these will fall off sharply. This applies to the large apartment houses, hotels, department stores, and many industrial establishments.

Dealers claim to be having difficulty in securing egg coal and it is understood that the large companies are drawing on their stocks for this grade. Broken has eased off somewhat, and will probably be reduced to supply the call for other sizes. Stove coal is considerably easier than egg, and dealers experience little or no difficulty in securing all they require, promptly. Nut appears to be absorbed readily although the market is far from bullish on this size. Pea coal is generally held at $2 at the mines. There is apparently a desire to push the sale of this grade coal rather than place it in stock, and this attractive price is having its effect, for the present at least; the circular is $2.50 plus the tax, for line and local delivery. Altogether, the market presents a favorable aspect, with only weakness here and there.

Prices at Tidewater rule about as follows:

	Circular	Individuals
Broken	$4.25	$4.25
Egg	4.50	4.50@4.60
Stove	4.50	4.50
Chestnut	4.75	4.60@4.70

Bituminous—This branch of the trade still continues to evince little or no indications of improvement. It is understood that many contracts have been renewed on the old basis, but in some cases it has been necessary to make some slight reductions. The medium coals are still quoted about $1 to $1.10 at the mines, with the better grades $1.35 to $1.40.

BALTIMORE

Better feeling in the trade but spot business remains poor. Exports hold up well.

There is a stronger feeling in the trade. A number of large contracts were placed here the past week, and while prices are less than last years figures, there is a growing tendency to cut down the margin and purchasers who continue to hold off are likely to pay close to the old prices. That operators are stiffening up is evident. Interests in southern West Virginia have held a meeting at Fairmont with a view to fixing prices and the result will probably be no more cutting. Toward the end of the week operators refused to consider prices that have prevailed for several weeks past along contract lines.

Spot business remains very poor, however. In the gas coal section of West Virginia three-quarter and run-of-mine are about on a par, offering to the trade at the mines as low as 75 and 80c. Slack, is selling at 75c. and low grade steam coals from West Virginia were offering at 80 to 85c., with best grades around $1.20. Pennsylvania coals ranged from 90c. to $1.25.

The charters for the past week included the following:

Vessel	Nationality	To	Rate
Harrington	British	West Coast, Italy	$10.56
Rio Perahy	British	West Coast, Italy	10.56
Bedeburn	British	Savona or Genoa	9.60
Governor Powers		San Juan, P. R.	3.00

Note—Steamers are indicated by **bold face type**, all others being schooners

HAMPTON ROADS

Exports and coastwise shipments holding up satisfactorily. Government takings during week heavy. Prices relatively firm.

The movement has been satisfactory considering existing conditions. The government has taken a large tonnage during the week to supply the battleships which have arrived from Guantanamo. The coal movement by sail seems to be falling off somewhat as compared with March. Coastwise shipments were heaviest to Boston and Providence with other cargoes to Bath, Portland, Allyns Point and Everett.

All of the large cargoes of the week have been New River and Pocahontas mine run although there have been several fair sized cargoes of nut and slack and high volatile going to the New England ports. Prices seem to be firm. The accumulation is being reduced somewhat and a number of shippers are rather short and urging the railroads to rush coal forward from the mines.

The new Collier "Ulysses" recently completed for the Canal Zone trade arrived in port during the week and after loading will go on her trial trip.

Although it is difficult at this time to predict what the movement for the month of April will amount to the prevailing opinion seems to be that dumpings will show up well. Dumpings over the N. & W. Ry. pier for the week ended Apr. 10 amounted to 141,134 tons.

Vessels clearing from Hampton Roads week of Apr. 2 to 9 inclusive were:

Norfolk			Newport News		
Vessel	Tons	Destination	Vessel	Tons	Destination
Alban	673	Para	**Sif**	4700	Fort de France
Windermere	3700	Vera Cruz	Frank W. Benedict	750	San Juan

Note—Steamers are indicated by **bold face type**, all others being schooners.

OCEAN CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Itasca		Norfolk	Bermuda	989	$4.00
Rio Pirahy	British	Baltimore	West cost, Italy	2297	
Bedeburn	British	Baltimore	West coast, Italy	2177	
Edward B. Winslow		Norfolk	Rio Janeiro	2482	8.50
Jacksonville		Philadelphia	Bermuda	547	3.00
St. Kilda	British	Virginia	River Plate	2469	9.36
Governor Powers		Baltimore	San Juan, Porto Rico	1578	3.00
White Wings		Philadelphia	Mayport	654	0.95
		Baltimore or Virginia	West Italy or Sicily		10.54
Gardiner G. Deering		Philadelphia	Guantanamo	1714	
Henry O. Barrett		Philadelphia	San Juan, P. R.	1564	
Three Marys		Norfolk	Bermuda	1024	3.00
A. & M. Carlisle		Philadelphia	Jacksonville	302	0.95
Edith		Norfolk	Rio Janeiro	1051	
Sallie C. Marvil		Norfolk	Pernambuco	546	
T. W. Dunn		Philadelphia	Para or Maranham	635	5.75
James T. Maxwell, Jr.		Norfolk	Maranhao	461	
Alice M. Colburn		Baltimore	San Juan, P. R.	1335	

Note—Steamers are indicated by **bold face type**, all others being schooners.

OCEAN FREIGHTS

Since our last report we have chartered a number of steamers for export coal, principally to South American and West Indian ports, and rates are practically the same as a week ago.

To	Rate	To	Rate
Havana	$2.50@2.75	Guantanamo	$3.00@3.25
Cardenas or Sagua	2.50@2.75	Demerara	5.50@6.00
Cienfuegos	2.75@3.00	Bermuda	3.50@3.75
Port au Spain, Trinidad	2.75@4.00	Vera Cruz	**3.50**
St. Lucia	3.50@3.75	Tampico	**3.50**
St. Thomas	**3.25**	Rio	**10.04**
Barbados	3.75@4.00	Montevideo, Buenos Aires or La Plata	**9.36**
Kingston	3.00@3.25	Mediterranean*	**10.80**
Curacao	3.75@4.00	Valparaiso†	8.40@9.60
Santiago	3.00@3.25		

Note—Rates noted in **bold face** type are only approximate.
* To a direct port not east of the West coast of Italy, Spain excluded.
† With 800 tons per day discharge.
W. W. Battie & Co.'s Coal Trade Freight Report.

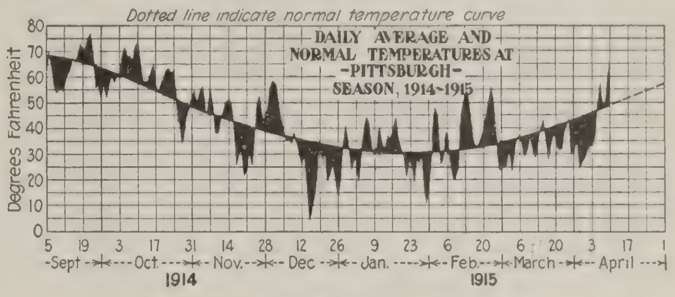
LAKE MARKETS

PITTSBURGH

Market shows no improvement and prices continue very irregular, with many consumers refusing to contract. Operations at 55 to 60% of capacity.

Demand for domestic coal continues light and no further activity of importance is expected in this branch of the market. Demand for steam coal has increased slightly but remains well below normal. Railroad demand has not increased to any noticeable extent as there is little more traffic moving than formerly. Demand for gas coal is very nearly normal, but prices are only a shade firmer for gas than for steam coal. What is injuring the market in particular is the poor Lake trade prospects as very little coal is likely to move before July 1 and unless industrial conditions in the Northwest improve greatly the total movement this season in the Lake trade will be poor, and perhaps below that of last year.

Buyers still show an aversion to making contracts for the twelve-month and it seems probable that unless there is a decided improvement in general conditions and coal market prospects many consumers will buy prompt coal from time to time and not make contracts until late in the year, when they will presumably desire to have contracts to carry them to Apr. 1, providing coal in the period in which buyers will be stocking up against a possible suspension of mining for adjustment of the wage scale. The contract market continues to be quotable roundly on the basis of $1.15 for mine-run, with shading possible on contracts at all desirable. Prompt lots are irregular, and asking prices, frequently shaded, may be quoted the same as last week: Slack, 90c@$1; nut and slack, 95c.@$1.05; nut, $1.05@1.10; mine-run, $1.05@1.15; ¾-in., $1.15; 1¼-in., $1.25, per net ton at mine. Mining operations are at 55 to 60% of capacity.



BUFFALO

Little activity shown in bituminous. Contracts not so numerous as in most years. Operators begin to ship coal to the Lakes. Anthracite business good, but not so large as a year ago.

Bituminous—The same dullness prevails in the bituminous market and everybody complains of trade being lighter than usual for the spring season. A notable unwillingness to enter into contracts is prevailing and many buyers evidently expect to confine their purchases to the open market for some time to come. They have no difficulty in getting plenty of coal, though mine operations are not at more than half capacity. Business in Canada is exceedingly quiet; plants manufacturing war materials are working over time, but the number is not large and the Canadian tonnage has fallen off largely with many contracts suspended.

Shipments of bituminous coal to Lake points have started. The season will begin within the next week or so, and the car ferries across Lake Erie are already in operation. It is doubtful if the Lake business will be heavy until late in the season; buyers are showing indifference at present, because of the large stocks left over from last fall. The outlook is for a poor volume of business at the beginning of the season.

Pittsburgh prices show some weakness and trade in spot coal has dwindled down to a small basis. Some cutting of contract prices is reported, though most sellers will not close far ahead at reduced figures. Prices are $2.80 for Pittsburgh select lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack, with Allegheny Valley sizes about 25c. lower than Pittsburgh.

Anthracite—The demand is running somewhat below that of last year, but most dealers are desirous of getting stocks at the April quotations. They are handicapped to some extent by the fact that their collections have been poor. Many have cut down their orders a third or so, while others are preparing to buy next month.

Shipments of anthracite up the Lakes will be slow in starting, because of the large ice fields at this end of Lake Erie. The nominal date for the opening is Apr. 15, but it will be some days after that before vessels can clear. The movement of water coal is likely to be on a less active basis than last spring.

TORONTO, CAN.

Trade quiet and marking time pending the spring discount.

The market is dull and featureless, the principal demand being for bituminous screenings. Supplies are now coming forward freely and the first cargoes by water are being received. Consumers are buying principally for immediate requirements until the spring reductions in price take place. Quotations for best grades are as follows: Retail anthracite egg, stove and nut $8; grate, $7.75; pea, $6.75; bituminous steam, $5.25; screenings, $4.25 to $4.50; domestic lump, $6; cannel, $7.50; wholesale f.o.b. cars three-quarter lump, $3.56; screenings, $2.90.

TOLEDO

Some coal moving to the Lakes. Prices on certain grades well maintained. Pocahontas scarce.

The coal trade is improving some due in part to the cold weather of the past two or three weeks. Pocahontas egg is quite scarce and is holding firm at the circular price of $1.60. Splint lump is in good demand at from $1.15 to $1.25. Slack continues strong and somewhat scarce, selling at from 55 to 60c. Some operators are shipping small quantities to the Lake. Real Lake business, however, will not commence until late in the season.

COLUMBUS

Trade continues quiet. Domestic business about over for the season and little is doing in the steam market.

The domestic trade is about over for the season and dealers are devoting their attention to cleaning up stocks. The tone of the market is fair, despite the unfavorable conditions but future prospects are not considered particularly bright.

Some difference is reported on dealers' stocks. In some sections stocks are light but in others dealers have bought liberally and their supplies are large. Retail business is slow and only a few small orders have been received; prices remain the same as last week.

In the steam trade things are also quiet. Manufacturing does not appear to improve and consequently fuel requisitions are still small. Buying off the open market is the rule and cheap prices are given. There is considerable difficulty in renewing steam contracts, many of which expire at this time. Some railroad fuel business is reported but numbers of these contracts are still hanging fire.

Lake trade shows no signs of awakening. Chartering is slow and only a few bottoms have been contracted for. Reports from the docks of the Northwest show that the surplus carried over is larger than ever before and there is little likelihood of any Lake shipments until July 1 if that early.

Production in Ohio fields has been small during the past week. Reports received from the Hocking Valley, Jackson, Crooksville and Cambridge fields show an output of approximately 25% of normal. In the Pomeroy Bend field the output is about 40% of the average.

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.45	$1.50	.....
Inch and a quarter	1.30	1.35	$1.30
Three-quarter inch	1.25	1.30	1.25
Nut	1.15	1.25	1.15
Mine-run	1.05	1.10	1.05
Nut, pea and slack	0.65	0.70	0.60
Coarse slack	0.55	0.60	0.50

CINCINNATI

The demand for nut and slack has continued to strengthen. Other departments of the market are quiet.

The domestic market is extremely dull, although it can hardly be called abnormally so for a between-seasons period. The scarcity of screenings has increased, if anything; the obvious uselessness of trying to force the domestic market has caused producers to cut down their output of the prepared sizes still further, and nut and slack are strong. The general situation is regarded as fairly good, and hopes are expressed that the season will yet develop into a satisfactory one.

CLEVELAND

Fine coal shows an unaccountable weakness. Lake shipping officially opens. Freights and insurance for the season.

Fine coal showed marked signs of being sold for lower prices at the beginning of the week with no apparent reason for the tendency. Lake coal is beginning to arrive.

Fine coal sold Monday at $1.70 to $1.75 with an undercurrent to the market that indicated still lower prices. Some Pennsylvania and West Virginia Lake coal is being produced, but the fine coal that was on the market did not come from the districts producing three-quarter for the Lake trade. Three-quarter and mine-run coals are selling as low as $1.80. There was a good supply of coal on track Monday morning.

Lake Trade—In the Lake trade boats are being loaded for the first trip. The first cargo was loaded Saturday at Huron for St. Clair River points. Lake Superior coal is being loaded at Ashtabula and Lake Michigan coal is being offered, but not being taken. It is too early for most of the boats. Lake coal prices have not been made.

Navigation opened Thursday midnight but only a few boats sailed because it is not customary to send out ships on an opening trip on Friday. Insurance this year as 3$\frac{3}{8}$c. on steel vessels, but an effort is being made to advance cargo rates on coal and ore to $\frac{1}{10}$ of 1% as against the 1914 rate of $^1/_{20}$ of 1%.

The Sunday Creek Coal Co. has appointed W. S. & J. S. Manuel, agents for Lake transportation of Sunday Creek coal. About 500,000 tons will be shipped. The forwarding agents placed the coal for delivery at the principal Lake Superior and Lake Michigan ports at 30c. a ton.

Quotations on coal for shipment are:

	Pocahontas	Youghiogheny	Bergholz	Fairmont	W. Va. No. 8
Lump	$2.95	......	......	......	......
Lump, $\frac{3}{4}$ in.	......	2.20@2.25	2.00	$1.90	$1.90@2.00
Egg	2.95	......	......	......	......
Mine run	2.45@2.50	2.10	1.90	1.80	1.75@1.90
Slack	......	1.80	1.75	1.70	......

LOUISVILLE

Operations down to a summer basis and there is still surplus coal.

Part time operations are the rule, while some mines are shut down altogether, and even at that it is reported stocks are accumulating. The domestic market is practically over for the season and the industrial and stocking demand is the only business that can be expected for several months. Reports of new operations to be opened up, extension of the rail facilities and combinations of mining operations, indicate greater activity than ever the coming fall and winter.

The best grades of block coal range from $1.30 to $1.60; 2x4-in. round, $1.10 to $1.20; run-of-mine, from 85c. to $1, according to dimensions, with the top quality nut and slack 65 to 75c., all prices f.o.b. mines.

NEW ORLEANS

Domestic business was particularly good during the past season. Interest of the New Orleans dealers will center this month on the big Government contract for coal to be delivered to the mouth of the Mississippi River.

Despite a dull market at present, there is some activity on the river front. England's recent orders have kept a great many ships from putting into this port for bunkering. The New Orleans Coal Co., the Monongahela River Consolidated Coal & Coke Co. and the W. G. Coyle Coal Co., which control practically all of the river bunkering, were the principal sufferers.

COKE

CONNELLSVILLE

No general activity, but slightly better tone. Production decreased slightly, following recent increases.

The coke market has shown a slight stiffening, though the change is largely a sentimental one, operators having come to expect somewhat better things for the future than formerly and being a trifle stiffer in their views as to prices. In the past week or ten days prompt furnace coke has been bringing $1.55, apparently as minimum, whereas for some time it was easy to do $1.50 on fairly desirable brands. There are still quotations at $1.60 and $1.65. Contracts extending to Jan. 1 would be quoted more strictly at $1.75 than formerly and for any deliveries running into next year operators are talking above $2. Prompt foundry is bringing $2@2.35, according to brand, while contracts seem to be a shade stiffer at $2.20@2.30.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Apr. 3 at 281,251 tons, a decrease of 3986 tons, and shipments at 278,014 tons, a decrease of 6699 tons.

Buffalo—Lack of trade is still reported and the demand shows no tendency to increase. Local handlers have done much less business than formerly this year. Prices remain the same at $4.25 for the best 72-hr. Connellsville foundry and $3.30 for stock coke.

Chicago—Some tonnage shipped here on consignment has been sold at prices below usual quotations. Improvement is noted in the buying of domestic sizes. Furnace and foundry coke shows no change, but gas house has declined. Quotations are as follows: Byproduct, $4.45@4.75; Connellsville, $4.65@4.75; Wise County 72-hr. (select), $4.50@4.65; gas coke, $3.85@$4; furnace, $4.45@4.65.

MIDDLE WESTERN

GENERAL REVIEW

Some improvement noted. Contracting unsatisfactory. Screenings steady.

Domestic coals have been more bullish, due to cool weather and buying of retail yards for household purposes. Although the market is not buoyant, it is felt by many that an upturn is in progress. The volume of coal moved from Indiana and Illinois mines is still moderate, and steam coals, if anything, have a better tone. The supply of screenings is about equal to the demand, and in some districts the prices have advanced as much as 10c. per ton.

Renewals of contracts are unusually slow for this time of year and buyers continue holding back awaiting developments. The industrial situation looks brighter, however, and if the improvement is more marked the closing of contracts will soon be on in full swing.

Production has slowed down to what may be considered a normal summer basis and the minima prices for the Indiana and Illinois coals have now been seen. Mine operations are so restricted and prices better maintained that very little consignment coal is to be found. Reports on the coming wheat crop are favorable, and while a deficiency of moisture has existed, recent rains over nearly all the Western wheat-growing states have caused favorable prospects for another bumper crop. This condition should reflect favorably for the Illinois and Indiana operators later.

CHICAGO

Better demand for domestic coals. Contracts closed on same basis as last year. Very little free coal offered. Anthracite about normal but considerable complaint as regards quality.

Increased orders have been received by Indiana mines for domestic sizes, and screenings have been in demand. Such contracts as have been closed for Indiana coals are on the basis of last year's prices. The best quotations reported for domestic lump this week has been $1.45 at the mines.

Southern Illinois screenings have been frequently sold at $1 per ton, and many orders remain unfilled. The demand for domestic coals from this district has improved, and prices on all sizes are held steady.

In the Springfield district the situation shows slight improvement. More contracts have been closed for Springfield and Peoria coals than elsewhere, and it is said that some railroad business has been placed for another year at the same prices as last year.

Splint coals are flat, although there is little free coal on hand. But little contracting for these grades is reported thus far.

Eastern Kentucky coals are in a state of inertia, and few shipments have come into this territory. A little consignment coal has been sold at about 15c. per ton under regular quotations.

Hockings have been in fair demand, and prices well held. No free coal has been reported on the market this week.

The smokeless situation is spotty, although no consignment coal is reported on track. Contracting is slow, but jobbers in this territory are showing a good deal of activity in this respect. There is some placing of orders for prepared sizes for future delivery.

Anthracite buying is about equal to last year at this time. Independent anthracite shipments of inferior quality and preparation have come into this territory and sold at low figures. Some independents do not seem to realize that they cannot use the Western markets as a dumping place for their inferior production. Improvement is shown in buying at April storage prices, but retailers are slow in placing orders.

Prevailing quotations are as follows:

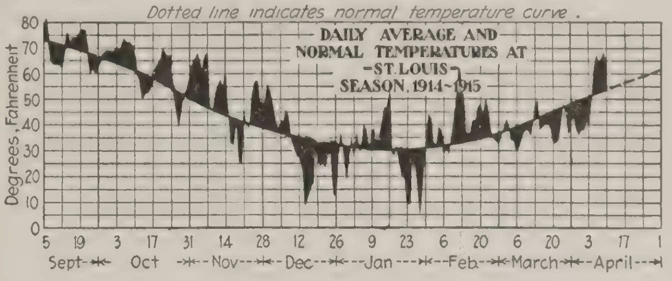
INDIANAPOLIS

Weather warm and consumption small in most lines. Contract-making proceeding satisfactorily at old prices.

Mines are not making better than half-time, prices are at the summer level, retailers are buying sparingly and the railroad and industrial demand is quiet. The weather has been the warmest of the spring and house fires were unnecessary many days. This reduced the demand for domestic lump and consumers have about completed their season's purchases. The retailers are apparently not going to reduce prices to the summer level until the first of May. Slack is easily sold at around 80c. to 90c. according to the grade, and mine-run ranges from $1 to $1.20. Contracts are generally being renewed at satisfactory figures to the operators.



ST. LOUIS

Market inactive and movement light. Important readjustment in marketing conditions. Anthracite movement normal.

There is very little activity even in the steam sizes which should be strong. There seems to be no tonnage of any consequence moving from either the Standard or the high grade fields, and there is nothing to indicate any improvement. The only size in demand is No. 4 washed, and this scarcity is due to the Chicago contracts being short.

Arrangements have been practically perfected, with a few exceptions, for the distribution of coal in the St. Louis market from the mines on the various railroads. Some of these arrangements are now in working order, and others will go into effect shortly. An operator is selected on each railroad, who handles the tonnage of all the mines on that road, and sees that it is evenly distributed. This has a tendency to group the coals from the different roads, and maintain a standard price for them. Similar arrangements have not as yet been made in the Williamson and Franklin County field. In carrying out this plan, the selling expense is reduced to a minimum and the jobber eliminated; it is expected that the public will eventually get its coal at a lower figure than heretofore, and the operator realize a better profit at the same time.

There is a fairly good tonnage of anthracite moving in, and orders are being booked well ahead. Smokeless is dull with very little doing, and no indications of any improvement. There has been practically no change in the circular prices.

KANSAS CITY, MO.

Both retail and wholesale business has suffered slight decrease. Prices unchanged.

The coal business has practically reverted to the summer conditions. There is plenty of coal on the tracks and many of the mines in this vicinity have completely quit operating and others are operating on a short time basis. Steam coals are in about the same demand that they have been all winter and no decrease is expected by the operators. The demand for slack has not changed while other types have decreased in demand.

Prices are as follows:

	At Mines	Freight		At Mines	Freight
Cherokee lump....	$1.85@2.00	$0.80	Waverly nut......	$1.75	$0.40

Total	4,985,398	5,164,703	1[illegible],995,040	14,461,886

Stocks at Tidewater Mar. 31 were 873,698 tons.

THE CAR SITUATION

Gross surplus of idle coal cars Apr. 1 was 145,069 as compared with 158,293 on Mar. 1. Shortage on the same dates was 33 on Apr. 1 and 14 on Mar. 1.

I. C. C. No. 5591—New England Coal & Coke Co. vs. Norfolk & Western Ry. Co.

Defendants make a charge for dumping coal into boats from their piers in the harbors of Norfolk and Newport News, Va., in addition to the regular transportation rate applying to the port on business destined beyond the Virginia capes; **Held,** That this practice is not unlawful. Complaint dismissed.

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

Recast

This section gives a synopsis of items previously announced that will come up for consideration during the ensuing week, together with the number of the page on which the former notice appeared; also additional or supplemental information, such as bids, etc., on other old contracts.

No. 287—Chambersburg, Penn.—The Chambersburg Electric Light Department will be in the market during the current month for approximately 2000 tons of bituminous "Jerome" coal (p. 487). Address Supt. J. H. Mowrey, Chambersburg Electric Light Dept., Chambersburg, Penn.

+No. 288—Troy, N. Y.—The Board of Public Works will contract during April or May for about 1200 tons of egg and stove coal, to be used by the city schools (p. 487). Address Commissioner of Public Works, Troy, N. Y.

No. 289—Chicopee, Mass.—The Board of Education at this place usually contracts for coal in April (p. 487). Address Committee on Supplies, Chicopee, Mass.

+No. 290—East Orange, N. J.—The Board of Education will be in the market during April or May for about 1800 gross tons of anthracite coal (p. 487). Address Secy. Warren A. Clapp, Board of Education, East Orange, N. J.

No. 335—Terre Haute, Ind.—The Board of Education at this place will be in the market during the current month for approximately 4500 tons of 1¼-in. No. 4 vein soft coal (p. 528). Address Board of Trustees, Terre Haute, Ind.

No. 336—Albany, N. Y.—The Board of Education will contract either in April or May for about 5000 tons of egg, chestnut and stove coal (p. 528). Address Board of Contract & Supply, City Hall, Albany, N. Y.

No. 362—Portland, Ore.—The bids on this contract (p. 566), which provides for furnishing coal for the local schools, have been duly referred to the Supply Committee, and awards are expected to be made on Apr. 19. Address School Clk. R. H. Thomas, Board of Education, Portland, Ore.

+No. 372—Noblesville, Ind.—We have been advised by the Union Sanitary Mfg. Co. that the present contract does not expire until Apr. 1, 1916 (p. 567). Address Pur. Agt. C. H. Ritchie, Union Sanitary Mfg. Co., Noblesville, Ind.

No. 376—Marion, Ind.—The Marion Paper Co. advises that it will not contract as noted in a previous issue (p. 567), but will buy its requirements for the present in the open market. Address Marion Paper Co., Marion, Ind.

+No. 384—Savannah, Ga.—The Savannah Electric Co. advises that this contract (p. 557) is handled through its Boston office. Address Stone & Webster, 147 Milk St., Boston, Mass.

+No. 397—Lorain, Ohio—Bids will be received until noon, Apr. 19, for furnishing coal for the school year 1915-16 to the Board of Education (p. 567). Address Clk. E. Bruell, Board of Education, High School Bldg., Lorain, Ohio.

+No. 432—Minneapolis, Minn.—The Board of Education at this place will be in the market during April or June for about 15,000 tons of bituminous and semibituminous coal (p. 626). Address Business Agt. F. E. Reidhead, Board of Education, 407 City Hall, Minneapolis, Minn.

+433—Reading, Penn.—The Board of Education at this place will be in the market during April or May for approximately 2500 tons of pea, egg and stove coal (p. 626). Address Secy. F. Roland, Jr., Board of School Directors, Reading, Penn.

+No. 435—Gloversville, N. Y.—The Board of Education at this place will purchase about 800 tons of egg coal during May or April (p. 626). Address Supply Committee, Board of Education, Gloversville, N. Y.

+No. 436—West Point, N. Y.—Sealed proposals in triplicate will be received until 2 p.m., Apr. 26, for furnishing anthracite coal required at the U. S. Military Academy during the fiscal year ending June 30, 1916 (p. 626). Address Quartermaster, U. S. Military Academy, West Point, N. Y.

+No. 438—Fort Reno, Okla.—Sealed proposals will be received until noon, Apr. 22, for furnishing coal required during the fiscal year, commencing July 1, 1915 (p. 627). Address Depot Quartermaster, Fort Reno, Okla.

No. 440—Chicago, Ill.—The American Compound Door Co. will be in the market about Apr. 20 for a month's supply of Franklin County, Illinois, No. 2 nut coal (p. 627). Address the Purchasing Agent, American Compound Door Co., Chicago, Ill.

+No. 445—National Soldiers' Home, Tenn.—Sealed proposals will be received until 2 p.m., Apr. 19, for furnishing and delivering 10,500 tons of bituminous coal to the National Soldiers' Home, Mountain Branch, N. H. D. V. S. (p. 627). Address Treas. Oliver K. Marshall, Mountain Branch, N. H. D. V. S. National Soldiers' Home, Tenn.

+No. 453—Fort Keogh, Mont.—Sealed proposals will be received until 11 a.m., Apr. 26, for furnishing 600 tons of lump coal and 150 tons of pile-run coal, at the Fort Keogh Remount Depot, Mont. The storage capacity is 400 tons lump and 150 tons pile-run (p. 627). Address Depot Quartermaster Capt. Sam. Van Leer, Fort Keogh Remount Depot, Mont.

No. 465—St. Louis, Mo.—It is estimated that the tonnage on this contract (p. 627), which covers the requirements for the Board of Education at this place, will run about 10% ahead on the bituminous coal used last year, and slightly less on the anthracite. Address Supply Comr. E. M. Brown, 3431 School St., St. Louis, Mo.

+No. 473—Portland, Ore.—Sealed proposals will be received until Apr. 20, for furnishing the steam and lump coal required for vessels and stations of the 16th and 17th lighthouse districts (p. 628). Address Lighthouse Inspector, Portland, Ore.

+No. 476—Jeffersonville, Ind.—Sealed proposals will be received until 10 a.m., Apr. 21, for furnishing bituminous coal to the Jeffersonville depot during the period ending June 30, 1916 (p. 628). Address Maj. Joseph T. Davidson, Jeffersonville, Ind.

+No. 496—Malden, Mass.—The requirements of the local Board of Education as noted in previous issue (p. 665) are purchased by the Joint Standing Committee on Fuel, which at the same time contracts for all the city requirements. The tonnages required this year are as follows: 2500 tons of hard white ash furnace or egg coal, 250 tons of hard white ash stove or nut coal, 200 tons of bituminous coal. The anthracite coal is to be delivered in the bins of the several buildings as may be designated previous to May 1, 1916, and the bituminous is to be delivered as may be required by the Street and Water Commission. In addition to this, 250 tons of hard white ash stove or nut coal will be required for delivery in various parts of the city in quarter-ton lots as may be designated by the Overseer of the Poor or Soldiers' Relief Committee. All bids must be accompanied by a certified check for $500. Address Clerk of Committees John L. Gilman, City Hall Building, Malden, Mass.

No. 512—Chicago, Ill.—The Barber Asphalt Paving Co. will be in the market about Apr. 25 for one car per day of southern Illinois screenings (p. 666). Address Purchasing Agent, Barber Asphalt Paving Co., Chicago, Ill.

+No. 520—Jeffersonville, Ind.—Sealed proposals will be received until 10 a.m., Apr. 21, for furnishing the Depot of the Quartermaster's Corps with such quantities of bituminous coal as may be required during the year commencing July 1, 1915 (p. 666). Address Depot Quartermaster Maj. Joseph T. Davidson, Jeffersonville, Ind.

+No. 521—Front Royal, Va.—Sealed proposals in triplicate will be received until 2 p.m., Apr. 21, for furnishing about 345 tons of anthracite coal to the Front Royal Remount Depot (p. 666). Address Depot Quartermaster, Front Royal, Va.

+No. 523—Xenia, Ohio—Sealed proposals will be received until noon, Apr. 22, for furnishing about 470 tons of Pocahontas mine-run coal and 150 tons of Hocking lump coal (p. 666). Address Clk. B. Schlesinger, 33 East Main St., Xenia, Ohio.

No. 525—Washington, D. C.—Awards on this contract (p 666) are still being considered pending the results of tests now being conducted by the Navy Department on the coal of the Clinchfield Coal Co., which was the lowest bidder at $2.50. Address Paymaster-General of the Navy Samuel McGowan, Washington, D. C.

+No. 527—San Francisco, Calif.—Bids on this contract (p. 666) will be received until 11 a.m., Apr. 30, instead of Apr. 23, as previously announced. The requirements are as follows:

Posts	Domestic	Steam

*Railroad station at Fort George Wright, and if proposals are made for post delivery, same should be on basis of f.o.b. cars Fort George Wright, Washington.

†Railroad stations at Fort Stevens and Vancouver Barracks, and if proposals are made for post delivery, same shall be on basis of delivery into bins or other places of storage at post.

‡For delivery at Astoria, Ore., aboard harbor boats.

Bidders are required to state a base price for delivery at the mines or at seaboard, the cost of transportation to the various posts and the cost of handling in each case. Payment will be made on the basis of analysis of samples taken as provided for in the specifications. Other conditions being equal, preference will be shown to bidders in this country as against those in foreign countries. Address H. S. Wallace, care Quartermaster Corps, "Chronicle" Bldg., San Francisco, Calif.

New Business

No. 534—Chicago, Ill.—The Booth Fisheries Co will be in the market about May 15 for a contract for one year for five cars per week of No. 2 Illinois or Indiana washed nut. Address Purchasing Agent, Booth Fisheries Co., Chicago, Ill.

No. 535—Louisville, Ky.—The Whiteside Bakery Co. will be in the market in May or early June for one year's supply of gas house coke. They usually consume one car load a week. Delivery by rail on Pennsylvania terminal. Address, W. Raven, Whiteside Baking Co., 14th and Broadway, Louisville, Ky.

+No. 536—Menominee, Mich.—The Marinette Light & Traction Co. of this place will soon be in the market for approximately 4000 tons of gas coal. Prospective bidders may obtain a copy of specifications on request. Address A. R. White, Menominee & Marinette Light & Traction Co., Menominee, Mich.

No. 537—Vicksburg, Mich.—The Vicksburg Governor Co. at this place will contract shortly for 750 tons of Hocking mine-run coal. Address Secy.-Mgr. F. X. Cullinan, Vicksburg Governor Co., Vicksburg, Mich.

No. 538—Kalamazoo, Mich.—The Kalamazoo Stove Co. at this place will soon be in the market for its annual requirements of coal, which will be approximately 3000 tons. Address Secy. to Gen. Mgr. Morgan E. Persnig, Kalamazoo Stove Co., Kalamazoo, Mich.

+No. 539—North Madison, Ind.—Bids are requested for furnishing the Southeastern Hospital for the Insane, situated near this place, with approximately 15,000 tons of the best quality Pittsburgh nut and slack coal mixed, or its equivalent, deliveries to be as required at the Power House, which is situated on the P. C. C. & St. L. switch from North Madison. Bids will also be received for the same grade of coal as may be required at the Water-Works Pumping Station near West Madison, delivery by wagon. Address Medical Supt. E. P. Busse, Southeastern Hospital, North Madison, Ind.

+No. 540—Knoxville, Tenn.—Bids will be received on or before Apr. 24 for furnishing the Southern Ry. Co. with a large quantity of Alabama mine-run coal. The following information is to accompany each bid: Price, f.o.b. mine; freight rate to Southern Ry. point; name and location of mine; average daily output; method of mining coal; name of seam worked; whether company is incorporated; name of operator; analysis of coal. Shipments are to be made in equal monthly installments beginning July 1, 1915, and ending June 30, 1916. Address Fuel Agt. E. G. Goodwin, Southern Ry. Co., Knoxville, Tenn.

+No. 541—Toronto, Can.—The Public Works Department of the Provincial Government of Ontario requests bids for coal as follows: Parliament Buildings, 2300 tons of pea coal; 100 tons of small egg coal. Ottawa Normal School, 405 tons of small egg coal; 15 tons of soft coal. North Bay Normal School, 75 tons of small egg coal. Osgood Hall, Toronto, 1100 tons of anthracite; 5000 tons of slack. Normal School, Toronto, 450 tons of hard egg coal; 30 tons of soft coal. Government House, Toronto, 175 tons of stove and nut; 20 tons cannel coal. London Normal School, 140 tons of small coal. Peterboro Normal School, 175 tons small coal. Stratford Normal School, 125 tons of small coal. Brantford School for the Blind, 90 tons anthracite; 80 tons soft coal. Belleville School for the Deaf, 130 tons hard and 1600 slack coal. Address Department of Public Works, Toronto, Can.

+No. 542—Chicago, Ill.—The Buda Foundry Co. will purchase from time to time on the open market, about three cars per week, Illinois or Indiana lump, commencing about May 15. They will also purchase about six cars per annum of Youghiougheny ¾-in. screenings and three cars of good blacksmithing coal; they will be in the market about June 1 for this latter supply. Address, Purchasing Agent, Buda Foundry Co., Chicago, Ill.

No. 543—Toronto, Can.—The Board of Education will contract next month for 7500 tons of soft coal and 7500 tons of hard coal, including egg, nut and stove. A large percentage of this is to be delivered at various city schools after July 1. Address, Wm. Kerr, Clerk of Supplies, Board of Education, Toronto, Can.

No. 544—Louisville, Ky.—The new Galt House Co. uses between 10 and 12 tons of coal, nut and slack, daily, but makes its purchases in the open market. Address Pres. Jacob Greenberg, New Galt House, Louisville, Ky.

No. 545—Louisville, Ky.—Ballard & Ballard, miller, is preparing to let its annual contract, effective July 1, for approximately 15,000 tons of nut and slack and pea and slack coal. The contract is let in accordance with the company's test system. Address Chf. Engr. Charles W. Clayford, Ballard & Ballard, Louisville, Ky.

No. 546—St. Joseph County, Ind.—The Board of Commissioners will receive sealed proposals for 600 tons of Pocahontas or New River smokeless coal, mine-run, 60% to be lump coal, to be delivered at the county jail. Dealers must submit analysis and the name of the mine in the bid. Also 500 tons of 6-in. lump steam coal, to be delivered on board cars at Muessel's switch for county asylum during the months of July, August and September, at the rate of two cars per week; one car of chestnut anthracite coal will also be required at this place. All proposals must be on forms furnished by the County Auditor and must be in on or before Apr. 26, together with the proper bond. Address Auditor Clarence Sedgwick, South Bend, Ind.

No. 547—Louisville, Ky.—The Louisville Milling Co. (local branch of the Washburn, Crosby Co.) has completed tests of several grades of steam coal and is preparing to let a contract for its annual supply of 8000 tons. It uses nut and slack principally. Address Auditor Leonard C. Lang, 222 West Burnett St., Louisville, Ky.

+No. 548—Washington, D. C.—Proposals will be received until 2 p.m., May 3, for furnishing the Government of the District of Columbia with coal as follows: Bituminous: 2000 tons of mine-run for delivery at Blue Plains, D. C.; 700 tons for delivery at the Industrial Home School and the Tuberculosis Hospital; 15,000 tons for delivery at any point in the District of Columbia; 125 tons of semibituminous (splint) for use in the Fire Department steamers; 6000 tons of mine-run for use at the District Pumping Station; 6000 tons for the District Pumping Station to be called for when required; 2500 tons for delivery at District Buildings; 4800 tons for delivery at the Sewage Pumping Station; 6000 tons, 1000 tons and 4000 tons for delivery at the Workhouse. Anthracite: For delivery at any point in the District of Columbia, 450 tons of Lykens Valley stove; 650 tons of red ash stove; 100 tons of white ash chestnut; 5000 tons of white ash egg; 1000 tons of white ash furnace; 1400 tons of white ash stove. Anthracite for delivery at the Industrial Home School and the Tuberculosis Hospital, 550 tons of white ash furnace; 40 tons of white ash stove; 40 tons of white ash chestnut. For deliveries in car lots at Institutions at Blue Plains, D. C., 75 tons of white ash stove; 50 tons of white ash chestnut. Forty tons of Connellsville coke will also be required to use at the District Pumping Station. Deliveries are to be made during the fiscal year beginning July 1, 1915. Prospective bidders should apply for specifications and proposal form. Address Purchasing Officer, D. C., Room 320, District Building, Washington, D. C.

+No. 549—St. James, Mo.—Sealed bids will be received at the Federal Soldiers' Home up to 12 o'clock noon on May 1, for 40 carloads of coal to be delivered during the next year. Address Supt. J. P. Brinegar, Federal Soldiers' Home, St. James, Mo.

+No. 550—Norfolk, Va.—Sealed proposals will be received at the United States engineer office until May 7, 1915, for furnishing about 3000 tons of bituminous coal. Address Lieutenant-Colonel of Engineers Pervey, United States Engineer Office, Norfolk, Va.

No. 551—La Porte, Ind.—The Great Western Manufacturing Co., manufacturer of crank hangers and cycles, will be in the market for a contract covering steam coal for next season, and will test out various coals to see which is most economically suited for their purpose. Address Pres. E. J. Lonn, Great Western Manufacturing Co., La Porte, Ind.

No. 552—Rochelle, Ill.—The Geo. D. Whitcomb Co., manufacturer of mining machinery, is in the market for its steam coal requirements for next season. The company prefers Southern Illinois coals. Address Gen. Mgr. W. C. Whitcomb, Geo. D. Whitcomb Co., Rochelle, Ill.

No. 553—Toronto, Can.—The Manitoba Division of the Canadian Pacific Railway, which formerly obtained its coal supply from the East, will in future use coal from the mines in the Crow's Nest Pass district and will require at least 1000 tons per day.

+No. 554—Governors Island, N. Y.—The Department Quartermaster, Eastern Department, U. S. Army, received bids until Apr. 14, to supply the fuel requirements at the 69 army posts of the department for the fiscal year beginning July 1. The requirements include anthracite, nut, stove, egg, furnace, and pea coal, and mine-run bituminous in various tonnages, running up to as high as 4048 tons. Payment will be made on an analysis basis. Complete details, together with blank forms and specifications may be had on application. Address Department Quartermaster, Eastern Department, Governors Island, New York.

+No. 555—Bridgeport, Conn.—The Board of Education at this place will be in the market for approximately 3500 tons of the best quality Lehigh anthracite some time during May. This business is let on a yearly contract, the figure last year being $5.75. Address Board of Contract and Supply, Dept. of Education, City Hall, Bridgeport, Conn.

+No. 556—Grand Rapids, Mich.—The local School Board will be in the market some time during May for its annual supply of coal. The call for bids is advertised, and the sale negotiated on a specification basis. Kanawha slack coal is used in the stokers and Pocahontas or New River mine-run for hand firing. Last year's contract provided for 3700 tons of Kanawha at $3.13 per ton, and 3750 tons of Pocahontas at $3.82 per ton. Address the Board of Education, Grand Rapids, Mich.

+No. 557—Brockton, Mass.—The Highway Commission at this place will contract some time during May for the annual supply of coal for the local school. Both anthracite and bituminous are required, the gross tonnage aggregating about 3000 tons last year. Address Highway Commission, City Hall, Brockton, Mass.

+No. 558—Hamilton, Ohio—The local Board of Education will contract about the middle of May or the first of June for its annual supply of coal. Last year about 1400 tons of smokeless mine-run was bought. The call for bids is advertised, and the business goes to the lowest and most desirable bidder. Address Clk. Charles F. Holdefer, Board of Education, 209 S. Second St., Hamilton, Ohio.

+No. 559—Bremen, Ind.—The local Light and Water Department at this place will be in the market about May 15 for its annual requirements of coal. Last year about 2000 tons of Youghiogheny was purchased at $3.15 delivered in bins. The business is done on a competitive basis. Address Light and Water Plant, Bremen, Ind.

+No. 560—Auburn, N. Y.—The local School Board will contract some time during May for their annual supply of coal involving about 900 tons of anthracite egg. This business was closed at $6.10 last year. Address Supply Committee, Board of Education, 144 Genesee St., Auburn, N. Y.

+No. 561—Racine, Wis.—The local School Board will contract some time during next month for their annual requirements of coal involving about 2000 tons of Pocahontas mine-run. Last year this business was closed at $4.40, $4.45, and $4.50 per ton. The contract is let to local dealers and the price is more or less dependent upon the haul. The call for bids is advertised. Address Board of Education, Racine, Wis.

+No. 562—Clarksdale, Miss.—The city government will contract some time next month for their annual requirements of coal, amounting to approximately 5500 tons, this business being closed at $2.64 per ton last year. The contract is let on a competitive basis, and mine-run coal is required. Address W. S. Bobo, City of Clarksdale, Miss.

No. 563—Lanett, Ala.—The Lanett Cotton Mills at this place will contract some time during the summer for their annual requirements of fuel, involving about 10,000 tons of nut coal. On last year's business "Empire" coal was used, the price being about $2.50 per ton. Address Supt. George S. Harris, Lanett Cotton Mills, Lanett, Ala.

+No. 564—New Orleans, La.—Sealed proposals will be received for furnishing the United States Plant at South Pass, La., for its annual requirement of coal, until 11 a.m., May 3. About 13,500 tons will be required at the government coal yard at Port Eads, or Burwood, La., delivery in lots of 1000 tons, and about 800 tons will be required for delivery on barges or boats at Port Eads or Burwood or for other ports as may be designated. Address Major Edward H. Schulz, Corps of Engineers, United States Engineer Office, Room 325, Custom House, New Orleans, La.

+No. 565—Whitehall, Mich.—The Whitehall Municipal Electric Light and Water Works Plant at this place will contract about May 15 for their annual requirements of coal involving approximately 1000 tons of three-quarter lump. Address Supt. E. Nelander, Whitehall Municipal Electric Light and Water Works Plant, Whitehall, Mich.

+No. 566—Boston, Mass.—The Board of Education will receive bids until noon, Apr. 20, for furnishing the fuel requirements at the public schools for the period from June 15 of the current year to Jan. 31, 1916, with the provision that deliveries shall be continued until June 15, 1916, in the event that an appropriation is made therefor and the School Committee so orders. Prices quoted are to include delivery in the bins as designated. About 60% of the tonnage may be put in during July and August of the current year. The approximate tonnages are as follows: City proper: Anthracite furnace, 1900 tons; egg, 470 tons; bituminous, 4900 tons. South Boston, anthracite furnace, 750 tons; egg, 200 tons; bituminous, 2300 tons. East Boston, anthracite furnace, 380 tons; egg, 250 tons; bituminous, 2100 tons. Roxbury, anthracite furnace, 1400 tons; egg, 220 tons; bituminous, 5200 tons. Dorchester, anthracite furnace, 1200 tons; egg, 500 tons; bituminous, 4600 tons. Charlestown, anthracite furnace, 250 tons; egg, 50 tons; bituminous, 1600 tons. Brighton, anthracite furnace, 700 tons; egg, 100 tons; bituminous, 800 tons. West Roxbury, anthracite furnace, 650 tons; egg, 300 tons; bituminous, 1200 tons. Hyde Park, anthracite furnace, 50 tons; egg, 230 tons; bituminous, 500 tons. The gross requirements are: Anthracite furnace, 7280 tons; egg, 2320 tons; bituminous, 23,200 tons. Prospective bidders must furnish a certified check for $50 for each district on which a bid is submitted and the successful bidder must furnish a satisfactory bond for 20% of the estimated amount of the contract awarded. Address Business Agt. William T. Keough, Room 801, City Hall Annex, Boston, Mass.

+No. 567—Brookline, Mass.—Sealed proposals will be received by the local city government until 3:50 p.m., Apr. 26, for furnishing approximately 2963 tons of anthracite coal and 2000 tons of bituminous. Specifications in detail can be had on application. Address Secy. of Board Edward A. McEttrick, Town Hall, Brookline, Mass.

+No. 568—Albany, N. Y.—Bids are requested by the State Government for coal to supply the public buildings, deliveries to be made during the fiscal year beginning May 1, 1915. The approximate tonnages required are as follows: 10,000 tons of No. 1 buckwheat, 2500 tons of bituminous slack coal, 600 tons of anthracite grate, 50 tons of anthracite stove or chestnut. The No. 1 buckwheat and bituminous coal is to be delivered at the coal bunkers of the Capitol Power House, and the other sizes are to be delivered as required at the Executive Mansion, State Hall and Geological Hall. Address Superintendent of Public Buildings, Capitol, Albany, N. Y.

Contracts Awarded

Note—Successful bidders are noted in **bold face** type.

+No. 199—Albany, N. Y.—The awards on this contract (p. 400), which provides for furnishing and delivering coal to the various State Hospitals, were as follows: **Empire Coal Mining Co.**—Broken, (W.) $2.39; (Bu.) $2.44; (Mo.) $2.79. Chestnut, (W.) $2.55; (Mi.) $2.53; (Bu.) $2.59. Stove, (W.) $2.44; (Mi.) $2.42; (Bu.) $2.48; (Mo.) $2.83; (K. P.) $2.70. Pea, (K. P.) $1.96. **J. F. Schmadeke**—Broken, (Mo.) $2.60; (L. I.) $2.50. Buckwheat, (L. I.) $1.20. **J. W. Peale**—Broken, (St. L.) $2.60. Buckwheat, (H. R.) $1.455; (Ma.) $1.14; (Ci.) $1.16; (Bi) 96c. **A. Larner**—Broken, (Mo.) $2.74. Pea, (Go.) $1.94. **Dodson & Co.**—Broken (H. R.) $2.45; (St. L.) $2.79. **Nealen Co.**

—Chestnut (H. R.) $2.59; (Mi.) $2.44; (Mo.) $2.77; (Ci.) $2.81. **James T. Holahan**—Chestnut (St. L.) $2.87. Screened nut (Ro.) $1.45. Stove (R.) $2.72. **Weston & Dodson**—Chestnut (H. R.) $2.63; (St. L.) $2.81. **H. E. Meeker**—Stove (H. R.) $2.52. Buckwheat (H. R.) $1.38. **Bowns Co.**—Stove, (Ma.) $2.397. **Neale Co.**—Stove, (H. R.)$2.48; (Mi.) $2.32; (Bi.) $2.35; (Ma) $2.66; (Ci.) $2.70; (Mi.) $1.65; (Mi) $1.31. **Bacon Coal Co.**—Stove, (L. I.) $2.95. **Wm. Farrell & Son**—Pea, (Ma.) $1.60. **H. H. Linneweaver**—Buckwheat, (K. P.) $1.15; (Ci.) $1.17. G. **D. Harris**—(Ci.) $1.5375; (K. P.) $1.5175. **C. D. Norton**—Mine-Run, (W.) $1.245. **Dexter & Carpenter**—(St. L.) $1.48. **C. D. Norton**—(K. P.) $1.53. **Geo. Hall**—Slack, (St. L.) anthracite $1.385; bituminous $1.435. **Geo. D. Harris**—(L. I.) $1.71. **Morris Run Coal Mining Co.**—(Bi.) $1.24. **Emmons Coal Co.**—(Bi.) $1.24.

The abbreviations used designate the following places of delivery: Utica State Hospital, (U.); Willard State Hospital, (W.); Hudson River State Hospital, (H. R.); Middletown State Homeopathic Hospital, (Mi.); Buffalo State Hospital, (Bu.); Binghamton State Hospital, (Bi.); St. Lawrence State Hospital, (St. L.); Rochester State Hospital, (Ro.); Gowanda State Homeopathic Hospital, (Go.); Mohansic State Hospital, (Mo.); Kings Park State Hospital, (K. P.); Long Island State Hospital, (L. I.); Manhattan State Hospital, (Ma.); Central Islip State Hospital, (Ci.). Address Purchasing Committee for New York State Hospitals, Room 138, Capitol, Albany, N. Y.

+No. 306—Algoma, Wis.—This contract (p. 488), which provides for furnishing the local City Water and Light Plant with approximately 900 tons of coal for delivery over the next year, has been awarded to the **Hilton Fuel & Transportation Co.**, at $3.55 per ton, as compared with $3.70 last year. Address Supt. J. O. Posson, City Water & Light Plant, Algoma, Wis.

+No. 347—Burlington, Ia.—The award on this contract (pp. 528 and 566), which provides for furnishing the local municipality with coal for the fiscal year ending Mar. 31, 1916, was made to the **Cave Coal Co.** at the following prices: Lump, $2.70 and $2.90; mine-run, $2.30; Fulton County, 1¼-in. screenings, $1.75; Franklin County, 2-in. screenings, $2.25. Address City Clk. Robt. Kroppach, Burlington, Ia.

+No. 383—New York, N. Y.—Awards on this contract (pp. 567, 664), which provides for furnishing and delivering coal to the Bellevue and allied hospitals, Departments of Correction, Public Charity, Bronx and Queens Parks, were as follows: **Bacon Coal Co.**, (18) egg, 260 tons at $6.05; (21) 245 tons at $6.15; (24) stove, 20 tons at $6.59; (19) 40 tons at $6.05; (22) 20 tons at $6.15; (20) 250 tons of pea at $4.44; (23) 95 tons of egg at $6.59. **Philip Ditez Coal Co.**, (28) 106 tons of egg at $5.90. **Pattison & Bowns**, (31) 1400 lb. of egg at $5.27; (32) 600 lb. of stove at $5.27. **George D. Harris & Co.**, (34) bituminous mine-run at $2.77; (35) 200 tons of gas coal at $3.40. **Meeker & Co.**, (33) 7800 tons of buckwheat at $2.68. **M. L. Bird**, (9) 330 tons of pea at $4.73; (10) 700 tons of buckwheat at $3.73. **John E. Donovan**, (11) 438 tons of egg at $5.98; (12) 50 tons of anthracite at $5.98. **William Brennan**, (4) 786 tons of egg at $5.95; (5) 8 tons of stove at $5.95. **Burns Bros.**, (7) 1112 tons of egg at $6.09; (8) 30 tons of stove at $6.68; (14) 499 tons of egg at $6.09; (15) 320 tons of stove at $6.34; (17) 407 tons of egg at $6.09. **Meyer Denker Sinram**, (3) 1000 tons of pea at $4.25. **John F. Schmadeke**, (16) 2650 tons of pea at $4.57. **John W. Peale**, (6) 1000 lb. of buckwheat at $3. **Jamieson & Bond Co.**, (27) 18 tons of egg coal at $6.90. **Burns Bros.**, (26) 190 tons of egg coal at $6.09. **A. M. Ryon**, (29) 65 tons of egg coal at $6.90. **J. E. Backus Sons**, (30) 218 tons of egg at $6.84. **John W. Peale**, (25) 250 tons of pea at $4.75. **Jurgen-Rathjen Co.**, (30) 218 tons of egg at $6.77. Address Contract Clerk, Room 1226, Municipal Bldg., New York.

+No. 410—Lebanon, Penn.—This contract (p. 568), which provides for furnishing the local light company with coal during the next year has been awarded to **C. G. De Huff**, the lowest bidder, on the following basis per gross ton: Egg, $5.42; stove, $5.72; nut, $5.87; pea, $4.37. Address Sec. John H. Seltzer, Lebanon School Board, Lebanon, Penn.

+No. 455—Clinton, Mass.—This contract (p. 627), which provides for furnishing the local school department with coal, has been awarded to **Connery Bros.** on the following basis: 457 tons of Pardee Bros. Lattimer Lehigh egg coal, $7.65, and 70 tons of Pardee Bros. Lattimer Lehigh broken coal at $7.45. Address Secy. of School Comm., F. E. Clerk, Clinton, Mass.

No. 528—Boston, Mass.—We are informed on good authority that this contract (p. 666), which provides for the requirements of the Boston Elevated Ry. Co., has been closed with the **New England Coal & Coke Co.** It is said that New River coal has been contracted for, and prices involved are not available. The contract provides for 275,000 tons per annum. Address Pur. Agt. Edward Mahler, Bureau of Purchase, Boston Elevated Ry. Co., 101 Milk St., Boston, Mass.

Contract Notes

Argentina—Due to the coal shortage in Argentina, there has been a decided advance in price. The local price at Buenos Aires is now $15.57. The freight rate from Cardiff, Wales, is $8.76.

Europe—An American consular officer in Europe cables that there is need in that country for 1,000,000 tons of American coal.

New York, N. Y.—Effective Apr. 1, the output of the Sterrick Creek Colliery of the Temple Iron Co. will be marketed through the Thorne Neal Co. Heretofore the product from this mine has always been handled by Williams & Peters.

Buffalo, N. Y.—The lowest bidders for furnishing the Buffalo Hospital with slack coal for the period from April to October were the Frick Coal & Coke Co. and the C. L. Amos Coal Co. at $1.90.

Baltimore, Md.—The Keystone Coal & Coke Co., Baltimore, Md., has closed contracts for furnishing 40,000 tons of bituminous coal to be delivered at Mediterranean ports, beginning May 1. To fulfill this contract, the company will use two steamships a month, carrying 5000 tons each.

Louisville, Ky.—R. E. Wathen, 104 West Main St., will act as the purchasing agent for various distilleries and breweries throughout Kentucky. He will contract for approximately 600,000 tons of slack, nut and lump coal, the contracts to be closed about July 1. Specifications stating grade of coal required, place and conditions of delivery may be secured at any time.

Foreign—A communication has been received by the Bureau of Foreign and Domestic Commerce from a business man in Europe who wishes to secure the names and addresses of exporters of coal and coke.

St. Louis—On the 1st of April contracts expired in St. Louis for approximately 647 cars per month of steam coal for St. Louis proper. This was divided into 418 cars of 2-in. screenings, 74 cars of No. 4 nut and 155 cars of lump and egg. For the past year, three-fourths of all the steam users in St. Louis have been buying in the open market. For the coming season it is expected that about one-fourth will continue buying in the open market, the remainder signing up on contract.

New York—The Lehigh & Wilkes-Barre Co. has been awarded a large contract for broken coal by the Standard Oil Co. Delivery is to be made at Constable Hook and Bay Ridge.

Fall River, Mass.—The American Printing Co. recently awarded a contract to the Chesapeake & Ohio Coal Agency for furnishing about 75,000 tons of New River coal.

The Central New England Ry. Co., a subsidiary of the N. Y., N. H. & H. R.R. Co., has awarded a contract for 150,000 tons of locomotive coal to the New England Coal & Coke Co. The West Virginia gas coal of the Federal Coal & Coke Co. will be used.

The Reading Circular—Taking effect Apr. 1, the prices of this company's coals, delivered on board vessels at Port Richmond, Philadelphia, for shipments beyond the capes of the Delaware, and New York shipping port, are as follows:

Grade	Philadelphia (Port Richmond)				New York			
	Broken	Egg	Stove	Chest.	Broken	Egg	Stove	Chest.
Free white ash	$4.75	$5.00	$5.00	$5.25	$5.00	$5.25	$5.25	$5.50
Hard white ash	4.85	5.00	5.00	5.25	5.10	5.25	5.25	5.50
Shamokin	.....	5.25	5.25	5.25	.....	5.50	5.50	5.50
Schuylkill red ash	.....	5.50	5.50	5.50	.....	5.75	5.75	5.75
Lorberry	.....	5.50	5.50	5.50	.....	5.75	5.75	5.75
Lykens valley	5.75	6.00	6.00	6.00	6.00	6.25	6.25	6.25

Prices f.o.b. mines are:

Sizes	Mahanoy and Shenandoah	Locust Mountain and Schuylkill White Ash	Shamokin	Lorberry and Schuylkill Red Ash	Lykens Valley Red Ash
Lump	$3.50	$3.50	.....	.....	.....
Steamboat	3.50	3.50	.....	.....	.....
Broken	3.50	3.50	.....	$3.75	$4.10
Egg	3.75	3.75	$3.75	4.00	4.35
Stove	4.00	4.00	4.00	4.25	4.60
Chestnut	4.15	4.15	4.15	4.25	4.60
Pea	2.50	2.50	2.50	2.60	2.75
Buckwheat	1.50	1.50	1.50	1.60	2 35

Orders that are accepted will be subject to ability to ship during the month of April, and all unfilled orders will be canceled at the end of the month. The railway company's manifest weight to govern in all cases.

The company reserves the right to change prices at any time without notice, and orders sent in will not bind the company until accepted.

A reduction of 50c. per ton from the above prices will be made on broken, egg, stove and chestnut, shipped during the month of April, 1915.

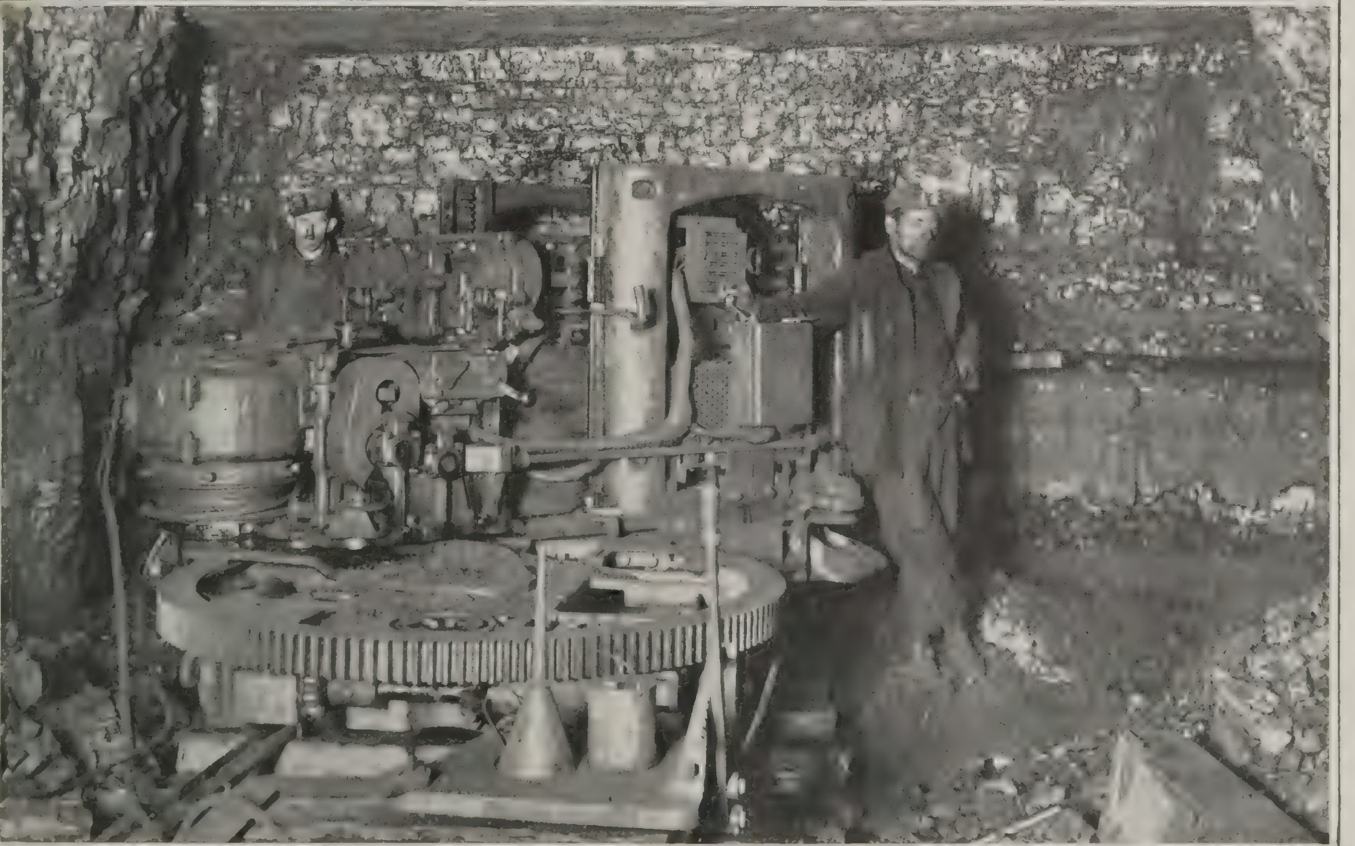
New Machine That Will Cut at Any Height and Leave a Perfectly Straight Rib and Face



RUN-OF-MINE TALKS

ON YOUR BUSINESS AND OURS

By the Business Manager

MR. W. L. SAUNDERS, head of the Ingersoll-Rand Company, in an address before the Technical Publicity Association of New York, told of an incident which is worth our attention on this page.

Some time ago the Ingersoll-Rand Company designed and started to introduce a new valve on their air compressors. Previously this valve had always been on the outside and quite easily accessible. The new type was placed in the piston and was hard to get at quickly.

Naturally it had other features which the company considered sufficiently valuable to warrant its adoption on their machines.

But almost immediately the salesmen began to report that prospective buyers were shying at the inaccessibility feature, and competing concerns were helping this feeling along by calling attention to the location of the new valve, in the piston.

"Supposing there's a break and repairs are necessary, what then?" they asked—and the best salesmen on the Ingersoll-Rand staff couldn't sell those compressors with the new valve.

What was to be done? Here was an improvement that people refused to accept simply because they were afraid of it. Obviously confidence must be aroused and aroused quickly.

So Mr. Saunders hit upon the plan of buying full pages in all the leading technical papers and in those page advertisements he said, simply, "The —— valves on our compressors are guaranteed against breakage for five years, Ingersoll-Rand Company."

That was enough. In a week the engineering profession, in all its branches, all over the world, knew that those valves were all right. The Ingersoll-Rand people staked their reputation on them, by backing them with a five-year guarantee in black and white.

And after that more compressors containing the valves in question were sold than had ever been sold of any other type before.

Now the point is, advertising saved the day for Ingersoll-Rand *because* it offered *complete protection* to the readers. They knew, the moment they saw those five-year guarantee ads, that they would be safe in buying.

Just as you know that you will be safe in buying any of the products advertised in your technical paper today.

And this is one of the greatest values of modern advertising—it has put out of usage that old-time phrase, "buying a pig in a poke."

COAL AGE

Vol. 7 NEW YORK, APRIL 24, 1915 No. 17

Let The Other Fellow Help

MR. MINE BOSS: You don't know it all. If you were to be sick for a month, the mine would not stop. If you were to die, the mine would keep on running. You have heavy responsibilities, but there is no need to carry them with a grimace.

The plant must be kept going, but there is no need for you to do it all yourself. You have subordinates who are able and willing to help as soon as you lose your frown.

When you lay off that north switch you can get some valuable pointers from your boss-tracklayer. He helped locate switches when you were in school.

When you put those new men on the tipple, ask the weighboss a question or two. He knows something about the disposal of the tipple force; his work has been on the tipple and nowhere else since the time he began to work at the mines.

When you have the repairs made on that motor-road trestle, do not say, "Do it thus," but say instead, "It can be done in this manner. Can anyone suggest a better plan?" And that new carpenter you put on last week will step forward with some helpful suggestions. He understands that class of work, for he spent two years in a railway bridge-gang.

That little trapperboy in the eighth east visited a neighboring mine one idle day last month, and if it were not for your stern expression he would like to tell you of a trap-door he saw there.

Learn that the collective experience of men is more valuable than the individual experience of a man.

Keep an open mind and a civil tongue.

Observe—ask questions.

Listen to Advice

ENCOURAGE *your men to make suggestions. You will thereby increase their interest and loyalty, the result of which will be higher efficiency all around.*

Longwall Mining in Alberta

By E. L. Leblanc*

SYNOPSIS—A successful longwall lignite mine which is worked only during the winter months, but is apparently in fit condition for operation after the long summer idleness.

Longwall advancing is being operated successfully in the lignite coal field of southeastern Alberta. The operation is known as the Block coal mine and is located about 3½ mi. north of Taber. The lignite is covered by 150 ft. of measures, the cross-section of the bed and its overlying strata being as follows:

CROSS-SECTION OF BED AND COVER

Strata	Thickness
Mixed clay and shale	
Sandstone	20 to 40 ft.
Soft shale	3 to 15 ft.
Bone	4 to 7 in.
Clod	8 to 18 in.
Lignite	3¼ to 4 ft.
Soft fireclay	

APPROXIMATE ANALYSIS OF THE COAL

Constituent	%
Fixed carbon	50
Volatile matter and moisture	44
Ash	6

The face cleats run N 62° E, and the butts at right angles (N 28° W). The seam dips N 22° E, 7 in. in every 100 ft. and outcrops along the banks of the Lethbridge River.

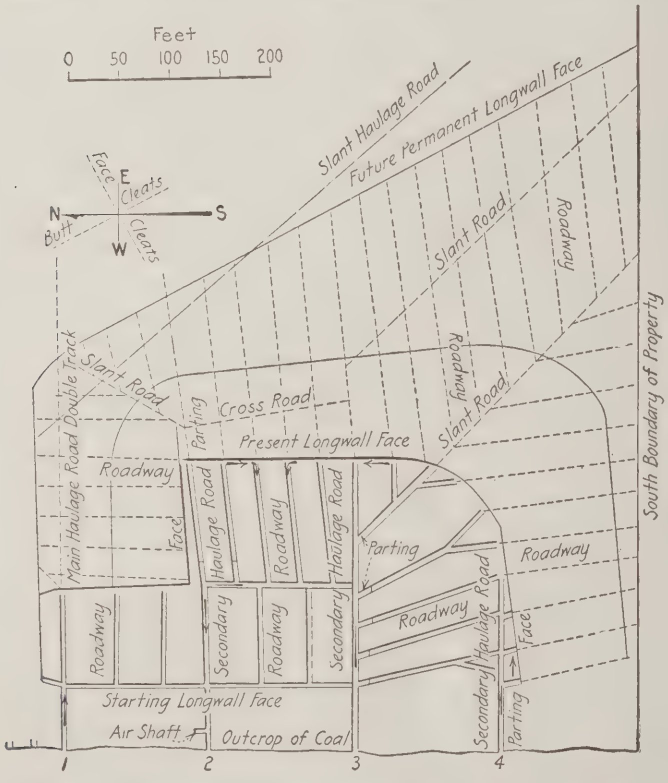


Fig. 1. General Plan of the Block Coal Mine, Taber, Alta.

The mine was opened in July, 1913, by four parallel single entries driven due east on 140-ft. centers. Three of these entries were connected as soon as marketable coal was reached, and longwall advancing was started with a 280-ft. face. Roadways were turned off the crossroads at 46-ft. centers.

Giving the Longwall a Rest of about Five Months

Mining was discontinued in March, 1914. The coal was well spragged under the last undercut, and a few cribs were built along the face. As a result when the mine was started up in September, 1914, the only trouble experienced was from the increased percentage of slack in the coal of this one cut which had been holed five months previously. But the next undercut was made under fresh roof, and here the percentage of lump was normal. Instead of the roadways being driven with 46-ft. centers, thereafter they were started every 30 ft. As this demanded less handling of the coal at the face, the percentage of lump increased.

Coal Works Best if Longwall Follows the Butts

As seen in Fig. 1, the cross and slant roads are turned off usually every 150 ft., with 175 ft. as a maximum. At present the longwall face is nearly 600 ft. long, 250 ft. of which is parallel to the butts and 320 ft. more or less in the direction of the face cleat. In the near future the entire longwall face will be made to follow the line of the butts. Experience has proved that if the longwall face is made in this direction the largest lumps of coal will be produced.

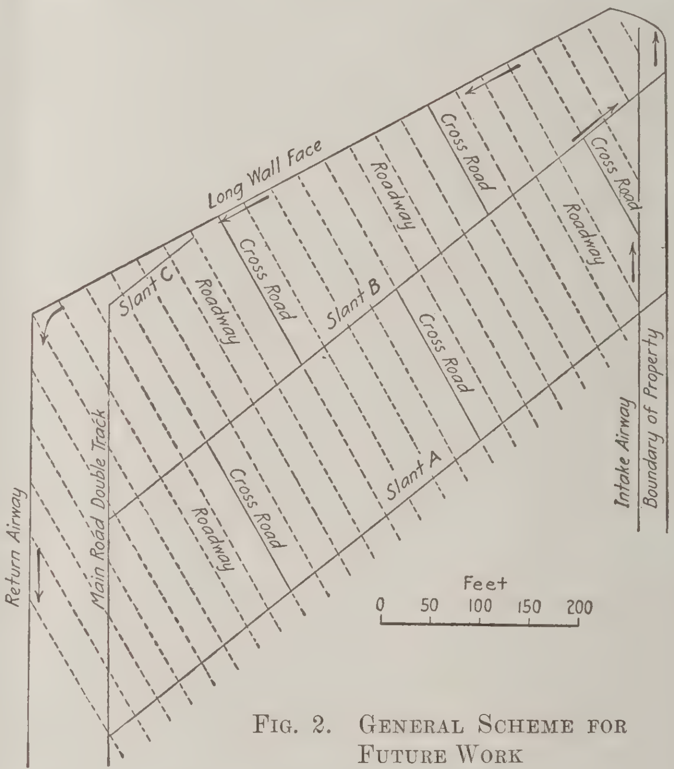

Fig. 2. General Scheme for Future Work

The mine was opened up to have the longwall face at an angle to the butts, because the roof was bad and conditions unfavorable; a few mines had tried this system but failed. So to make longwall a success, it had to be worked carefully and the system modified. Results have proved it successful with these changes. As shown in Fig. 2, when slant *C* will reach the boundary, slant *A* will already be cut off. As the coal will always come from only two slant roads an endless-rope haulage may be used in the main road as soon as distance renders the change advisable.

---

*Taber, Alta., Can.

In future slant roads will be turned off the main haulage at 175-ft. centers. Secondary-haulage roads, or crossroads, will be turned off the slant roads at 240-ft. centers, and ordinary roadways will be spaced 30 ft. apart, center measurement (see Fig. 2).

UNDERCUTTING IS DONE IN CLAY OR IN BOTH CLAY AND COAL

In mining the coal, it is first undercut by electrically operated Pick-Quick bar coal-cutter longwall machines. On the average a cut 4½ ft. deep and 350 ft. long is made per day, the holing being done in the clay bottom. Where, however, the bottom clay is wet, the holing is made partly in the coal. A 6-in. kerf is cut, and four men are required to operate the machine—a machine runner, a barman, a scraper and a timberman.

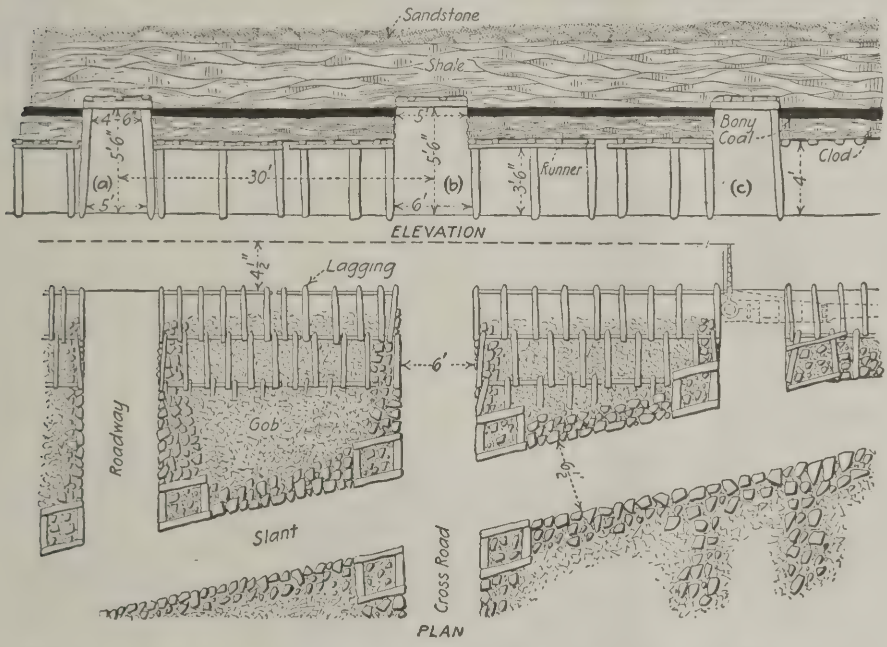

FIG. 3. PLAN AND VERTICAL CROSS-SECTION OF LONGWALL WORKINGS, SHOWING MANNER OF PROPPING AND CRIBBING

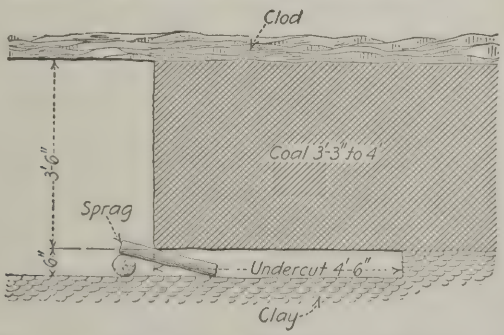

FIG. 4. SPRAGGING METHOD ADOPTED FOR LONGWALL FACE

As the machine proceeds, the barman gobs the dirt brought out by the machine bar and sets sprags under the coal every 15 ft., after which the timberman timbers the face (see Fig. 3). Laggings are set up under the clod or draw-slate and are supported by runners 12 ft. long. Each runner is propped by three posts 4 in. in diameter. The runners measure from 6 to 8 in. in diameter, but are sawed along their length so that they measure only 3 in. by 4 in. by 12 ft. The scraper cleans out the dirt lying below the undercut and pulls out all the sprags, or at least some of them.

The advantage of this Pick-Quick machine is that if the coal should fall on the bar, the machine can proceed and the bar will clear itself. The power consumption is low, and no narrow work in developing is required. After the coal is undercut and the sprags drawn, if the roof pressure does not bring the coal down, the cut is shot, a half a stick (or ⅛ lb.) of Monobel being used to bring it down.

The coal is loaded with a fork, and the slack remaining is then put into a car, so that as little of the coal as possible is gobbed and all the room required saved for the brushing of rock. Brushing at the face of the roadway is done by loaders, and timber is then set up at 4½-ft. centers. Timbering in the roadway is set up as shown at *a, b, c,* in the upper part of Fig. 3, conditions determining which plan is chosen.

PROTECTION AGAINST UNDUE PRESSURE BREAKING POSTS AND SHEARING ROOF

It will be noticed that all posts set up at the face are tapered so that they will sink in the floor as the roof settles under the weight. When the ribs are moderately hard, it is better not to put any posts to the booms.

Where the roads meet, cribs are built to strengthen the corners as in the lower part of Fig. 3. These cribs are built on top of 10 to 12 in. of dirt, so as to yield to the roof pressure and prevent shear in the roof. The slants and crossroads are brushed after the roof has completely settled, so that they are 6 ft. high above the rail and timbered whenever possible, as is shown in the center road in the upper part of Fig. 3, the dirt being taken out of the mine or stowed in old roadways.

The mine has not been worked regularly because the coal has had to be hauled 3½ miles by teams to the Taber station. If a railway spur were built to the mine, 200 tons of screened coal could be produced daily, and this output could be increased rapidly as the longwall face can be extended at will. A second longwall machine would double the output in a short time.

The mines in the lignite field do not work during the summer months, which is a disadvantage to the longwall system of mining, but by spraggng the coal properly and strengthening the timbering of the last cut before discontinuing, this disadvantage is easily overcome.

⁂

Electric conductors and telegraph wires are often either tinned or galvanized. The wire is first passed through a tank of acid, which cleans it; next through a tank of water, where the acid is washed off, then through a flux, and finally through molten tin or zinc. It is not difficult to get the tin or zinc to adhere over almost the entire surface, but the perfection demanded requires that every portion of the wire must be covered with a uniform thickness of metal, which must be bright and which will not peal off nor crack.

A Square Working-Place with an Overcutting Machine

By E. C. De Wolfe*

SYNOPSIS—This center-cutting machine is so constructed that as the cutter-bar makes its sweep across the coal face its end travels in a straight line from rib to rib. This movement of the bar end assures at all times a square working-place.

Natural standards of practice develop as time and experience demonstrate what is really best. Nothing in coal mining is more definitely established as a feature of good practice than the squareness of face for which all miners strive.

The pick-worker prides himself on the uniform squareness of his place. Operators of the puncher and the breast and shortwall types of chain machines all have aimed to undercut a uniform depth across a straight face. It is eminently proper, then, that a further development in coal-cutters should avoid violation of this well-established requirement of economy and general desirability.

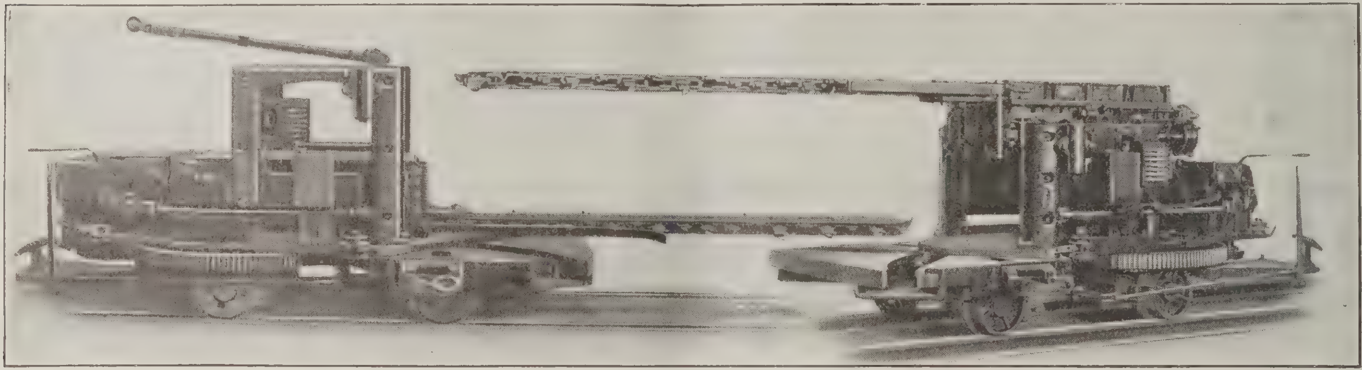
An overcutting machine has just been developed which operates wholly by power, from a position on the track, makes its kerf at any height from low center to top of seam, cuts a straight face and leaves straight ribs. It thus combines the advantages of overcutting, in seams wherein this method is preferable, with maintenance of a square face in entries and rooms.

There should be no ill-considered adoption of the overcutting method in coal mining. Only an overflow of unrestrained enthusiasm would urge that any overcutting machine can be best adapted for use under all conditions, and the cautious operator will proceed only on proper consideration of the physical conditions to be met and the economic results to be attained.

The overcutter, in work to which it is suited, will often be the means of practical and profitable operation in situations otherwise extremely difficult. It may increase the production, lower the costs and improve the general mining conditions in many workings which today are quite satisfactorily served by the shortwall and breast types of undercutters, yet there are unquestionably circumstances under which the undercutter will still make the better showing. For the more special conditions to which it is particularly well fitted, however, the overcutter is assured a definite field of utility.

The "Straightface" overcutter, made by the Goodman Manufacturing Co., Chicago, is a full-functioned machine, doing in simple manner everything that the coal operator can reasonably wish his cutting equipment to do. In cutting a straight face and straight ribs it does what no other continuous cutter has attempted, and to this extent it does what no other machine is expected to accomplish.

Fig. 1 shows the machine as arranged for "center cutting," while in Fig. 2 it is shown with the cutting element inverted to make it a "top cutter." This feature is at the disposal of the operator for conversion of the machine at any time to suit his conditions or preferences. For each arrangement there is a considerable range of vertical adjustment for the height of the cutting.



Figs. 1 and 2. Showing the Machine with Cutter-Bar Lowered for Center Cutting and Raised for Top Cutting

Construction and Operation

The base of the machine, mounted upon four truck wheels, is a steel casting with finished top surface. On this base the operating portion of the machine moves, and by it is guided and controlled.

The bed of the operating portion is of steel casting, with vertical steel casting guides for the adjustable cutting element, and carrying also the secondary motor and mechanism for feeding and auxiliary functions.

In each of the four vertical guides for the cutting element is a rack, into which meshes a pinion by which the elevation of the cutter arm is adjusted and determined.

At the front the machine base carries a V-shaped slot, with steel sides properly curved for guiding the forward end of the machine so as to make the straight face-cut across the room, the swing being effected by a spur pinion in mesh with the circular rack at the rear of the base.

In traveling into a room the cutter arm extends forward. The machine advances until the arm is close to the face, as shown in the first position, Fig. 3. The lever-and-quadrant brake is then set and a telescoping anchor-drill rod is adjusted, extending forward to the face. The drill is driven by the secondary motor, and the anchor hole is quickly cut in the face directly ahead of the machine.

---

*Editor "Electrical Mining," 537 South Dearborn St., Chicago.

The anchor being set, the wire rope from a drum on the rear of the machine is led ahead and attached, while at the same time the feed is thrown in to swing the cutter arm to the right-hand corner of the place. This brings the machine into position 2, Fig. 3.

The brake is then released and the feed thrown out. The wire rope drum is thrown in, and the sumping cut is made by drawing the machine forward on the track to a point corresponding to position 3, Fig. 3. Evidently the sumping makes a rib cut as straight as the track.

As the sumping is completed the drum drive is thrown out, the feed thrown in and the cutter arm starts its running cut across the room. The feed pinion, as it works around the circular rack, guided by the radius arm, acts in proper combination with the V-cam and roller in front to cause the cutter arm to withdraw until a central position is reached (position 4, Fig. 3) and then advance to the left (position 5, Fig. 3), so that the end of the arm follows a straight line across the room and thus cuts a straight and square face.

The drag of the bits in cutting holds the machine to the face, so while the cross-swing is being made the sumping rope may be shifted from the anchor ahead on the right to a jack behind on the left (position 5, Fig. 3), so that by throwing out the feed and throwing in the rope drum drive the backing out begins as soon as the swing-cut is complete, thus making the entire cutting operation continuous—sumping, swinging and withdrawing.

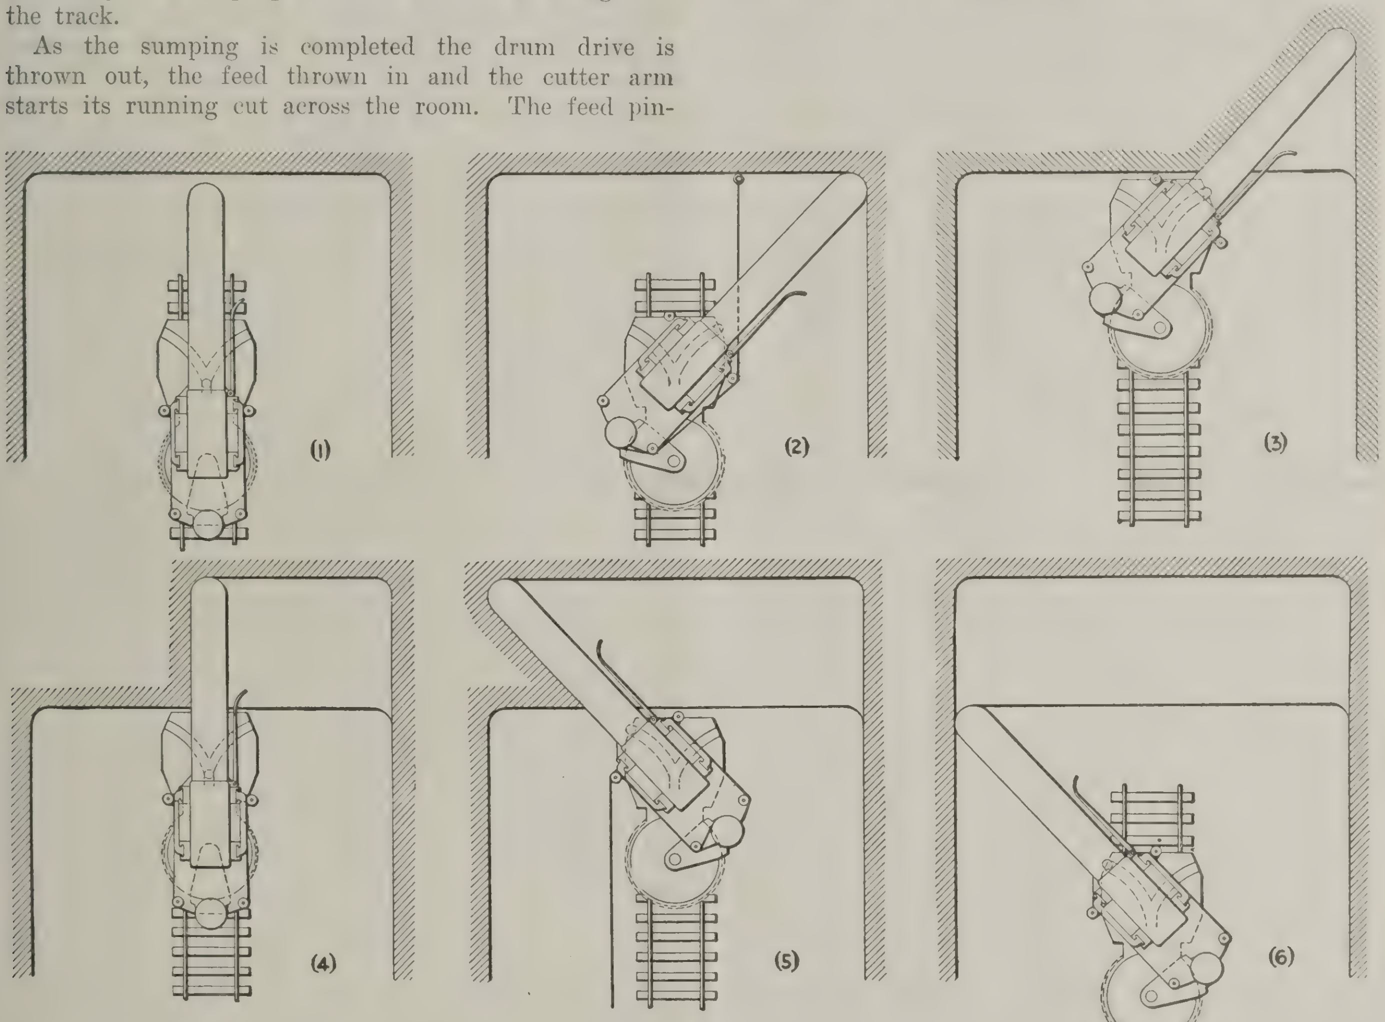


Fig. 3. Showing Six Principal Positions Assumed by the Machine in Cutting a Working Place

In backing out, the machine reaches position 6, Fig. 3, leaving the cut at the lefthand rib as straight as at the right and giving a perfectly squared place 20 ft. wide, undercut to a depth of 7 ft.

Swinging the arm again to a central position, the machine is ready at once to travel to the next working-place.

Narrow Work and Room Turning

The operation is exactly the same in entry driving, except that the full swing of the machine is not utilized. An indicator shows always the width of swing to right or left from the center for all positions of the cutter-arm, enabling the runner readily and definitely to govern the width of his cutting. In a 12-ft. entry, for instance, he sumps with the indicator at 6 on the right and backs out with it at 6 on the left, or at any other right and left figures totaling 12 if his track is not in the center. He can widen at one side for a passing track by working full 10-ft. swing on one side and only the regular 6-ft. on the other.

Entries can be widened or slabbing done anywhere by continuous running cuts, the cutter-arm being swung to one side the proper distance and locked while the machine is drawn along the track by the wire rope.

Room turning is started by one or two short slabbing cuts, after which the room track curve brings the machine into position for operation in the usual way, driving the room neck as in any narrow work. Widening out the room is evidently an easy matter with this machine, by simply increasing the swing for successive cuts until the full width is reached.

The front cover shows some of the machines in use by the Main Island Creek Coal Co., at Omar, W. Va.

The main motor on this machine, besides driving the cutter chain, operates also the pinion shafts for raising and lowering the cutting element. The arrangement is such that the arm is raised or lowered only while the chain is running. This not only prevents untimely use of the elevating drive, but also insures its operation along with the cutting, enabling the chain to cut its way gradually upward or downward, thus following any desired line of cutting.

All other operations of the machine, such as the drilling for the face anchor, the rope winding for sumping and backing out, the feed on the cut across the face, and the propulsion from place to place, are effected by the secondary motor. The secondary motor is of the crane type, series wound, and gives the variable speed desirable for automatic adjustment to suit the conditions of the cutting, drilling or traveling. For the feed drive this is of special importance, because it enables realization of ideal conditions in cutting—a uniform speed for the chain and a variable speed to allow slower advance through hard places. The same advantage applies to the operation of the drill, the wire rope and the propelling mechanism.

This is not a turret machine. It does not swing about a fixed center, with a comparatively short radius of application for the turning forces. Fig. 3 shows that the cutting element operates as a lever of nearly equal arms. The "work arm" is the overhung length of the cutter-bar; the "power arm" is the distance from the cam roller at the front of the moving frame to the pinion at the rear. There is therefore a long leverage at all times for forcing the cutter arm to its work.

Automatic stops are provided for limiting the swing to any desired point on either side. Either stop may be raised to permit farther swing, and in such farther swing no harm can result from failure to stop the feed by hand, as the feed pinion simply runs off the end of the circular rack and continues idly turning until the drive is thrown out or the power interrupted.

A trolley pole is regularly supplied for use on haulage locomotive entries. The machine runner rides on a small platform at the rear, on which also are mounted the brake lever and quadrant. He here has full control of the machine movement, just as has the motorman of a haulage or gathering locomotive.

The cable reel for delivery of current to the machine for traveling and operation in rooms is carried upon a separate two-wheeled trailer truck, which pays the cable out freely in entering the room and winds it in automatically as the machine comes out.

In hard cutting it may sometimes be necessary to use the brackets at the sides of the base, just over the forward wheels, for setting jacks to the roof to hold the machine firmly to the track. These jacks are needed but seldom as the weight of the machine and its steady, powerful action render such special devices unnecessary.

Extracts from a Superintendent's Diary

A delegation of ladies from the city paid me a visit today. They are canvassing the state in the interest of a proposed child-labor law. I had been expecting them for some time, having heard of their campaign from some of the superintendents who had already been honored.

Being naturally rather timid in the presence of strange ladies, I decided to take advantage of the warning I had received and commit a few arguments to memory, hoping thereby to be able to deliver them effectively in spite of all embarrassment.

It was a waste of good time; they came to deliver arguments and ideas and not to receive them.

The chief spokeswoman began about as follows: "We realize, Mr. Stewart," (Stewart is the name of the superintendent at one of the other mines owned by our company, but I did not correct the ladies, fearing that their talk might seem less personal after such a correction) "that you are only a representative of this monster corporation, and we don't want you to become offended at any insinuations we make against it, because we know that you must follow instructions, no matter how much they may outrage your ideas of justice. But we feel that because the owners of your corporation cannot be approached in person you ought to pass on to them our ideas and in turn insist that they issue instructions to you that will permit you to take a prominent part in this fight."

Think of it! Here they were telling me that I must believe as they did or be ranked in the same class as my terrible absentee owners and directors.

Realizing the futility of trying to justify my own opinions or the acts of my directors in the face of such prejudice, I silently manifested great interest in their arguments and allowed them to continue. Truth is, some of their opinions were so ridiculous that I became very much amused at their conversation.

After they had relieved themselves of all of their set speeches and were preparing to depart, I suggested that they lay aside the burden of the campaign for an hour or so and take a look at the men of our camp. It happened to be payday, and our men had all quit work at noon and were waiting for the paymaster to arrive.

I remarked to the ladies that they might interview some of the men and boys and get their ideas about child labor, but this suggestion did not meet with their approval. "Workingmen have no opinions on such matters that are worth considering," remarked one of the ladies. "They always have to be educated up to such progress, and as a rule, in the beginning, they always oppose legislation intended for their betterment and protection."

That remark was worthy of being classed as argumentative to say the least, so I took courage and made another effort: "But surely grown men can offer evidence as to whether they are being treated as human beings or being made mere slaves by employers who live thousands of miles away from them and for that reason can have no sympathetic interest in their doings." That from me.

This from them: "Mr. Stewart, one of your labor leaders addressed our club for two hours last week, and as he intimated that he would rather not have us make his talk public because his job might be in danger we probably know more of your men's feelings than you do."

I made no further effort to delay their departure.

Death of F. C. Keighley

Frederick Charles Keighley, a resident of Uniontown, Penn., and general superintendent of the coke operations of the Oliver & Snyder Steel Co., was found dead in his garage Wednesday evening, Apr. 14, at about 6 p.m., by his son, Henry Keighley. He was the victim of a self-inflicted wound, the shot having entered his mouth and emerged from the top of his head. When discovered he was lying on the floor in a pool of blood.

The bullet which caused the coke man's death is believed to have been fired at about 10 a.m. The deceased spent the early part of the morning at his office in Oliver, and it was noticed by his associates that he was somewhat nervous and excited. He left at 9 a.m. and went to his home, handed some papers to a daughter and left the house without removing his overcoat. It is believed that he immediately went to the garage.

Frederick C. Keighley

It is said that Mr. Keighley had been despondent for some time, owing partly to the illness of his daughter, Mrs. William A. Hogg, who is a patient in a Pittsburgh hospital; but the actual motive is thought to have been financial worries incident to the closing of the First National Bank of Uniontown, Penn.

Following the report of the tragedy and the issuance of a newspaper extra with the sad tidings, the home of Mr. Keighley was besieged by sorrowing friends. So great was the number arriving at the home that police officers were detailed to the residence, and only a few intimate friends of the family were admitted.

For a number of years Mr. Keighley has been a member of the Board of Education, and until last year he officiated as president. In politics he was a Republican, being influential in the counsels of his party.

For many generations the Keighleys have been prominent in England, their home being in Yorkshire. There Jeremiah Keighley, a wool-buyer, lived and died in the city of Leeds. His youngest son, Charles Keighley, was the father of the Oliver superintendent. He was a jobber in dressgoods in his native country, but when he came to the United States in 1865 he became chief bookkeeper for the Mahoning Coal Co., at Youngstown, Ohio.

Ten years before his father came to America, F. C. Keighley was born at Victoria Terrace, Keighley, Yorkshire, May 5, 1855. He attended school in England and on arriving in America studied for one year in the public schools of Youngstown, Ohio. After this brief preparation he began work, securing a position as office-boy under his father's supervision. Strict attention to his duties led to his promotion until he became his father's assistant.

After gaining an insight into the business methods of the company, young Keighley began work with the engineering corps. He was shortly promoted to the superintendency of one of the mines of the Mahoning Coal Co., and for four years preceding 1880 was manager of two of the company's stores.

On Sept. 15, 1880, Mr. Keighley arrived in Fayette County as manager of a store operated by the Youngstown Coal Co. After six months' meritorious work he was promoted to the superintendency of the plant. His father followed him 11 years later, becoming store manager for the Youngstown Coal Co.

Later he began to operate coal mines on his own account at Toms Run, Allegheny County, Penn. He operated a mine there for 18 months, sold it out and returned to Uniontown as general manager of the Youngstown Coal Co.'s operations, holding that position for two years.

Fred Keighley was superintendent of the Mammoth plant of the H. C. Frick Coke Co. for a short time, and then in 1891 he became identified with the Oliver & Snyder interests. He assisted in the erection of the Oliver coke plants north of Uniontown, and in 1897 was made general superintendent of the coke operations of the three large plants.

He was held in high esteem among the men engaged in the mining of coal and the manufacture of coke in this section, and his advice was not infrequently sought by some of the most prominent coke producers when solving the problems of their business. With the men at his mines and coke works, Mr. Keighley was very popular. He was regarded as one of the most likable men in the coke region.

Not only in Fayette County, where he was intimately known by thousands, but throughout the entire country wherever coal is mined, Fred Keighley was a prominent figure. For six years he was president of the Coal Mining Institute of America, and for two years previous to the appointment as superintendent of the Mammoth plant of the Frick company he was the state mine inspector of the Fifth bituminous district, filling the position now held by Inspector I. G. Roby.

Mr. Keighley was a trustee of the Methodist Episcopal church of Uniontown and also a member of the Elks. His handsome residence on East Fayette St., Uniontown, was erected in 1904. He was married to Miss Lucy J. Burnett, daughter of James Burnett, a former contractor and builder of Trumbull County, Ohio, on June 1, 1876. His wife and the following children survive him: Mary Grace Keighley, Mrs. Florence Hogg, widow of the late William A. Hogg, Thomas, Charles, Rose, Henry and James Keighley.

Importance of Safety Inspection by Company Inspectors*

By J. W. Groves†

SYNOPSIS—State inspection is usually inadequate and limited by the provisions of the mining law. The author urges that private inspection is not only ethical, but economical.

We consider that project successful which accomplishes the object for which it was established. The statistics of the companies which have adopted safety inspection prove beyond a doubt that the measure is successful as it reduces both the number of accidents and their harmful effects. During the past eight years nearly all the large coal companies and many of the smaller ones and many corporations engaged in other lines of work have employed inspectors whose duties are to report upon all dangerous conditions and to suggest safety measures.

State Inspection Inadequate, Limited and Apt to Appear Unfriendly

They have found that the inspectors, appointed and paid by the state, cannot visit the mines with the necessary frequency, are primarily interested in the enforcement of the state mining law and have time insufficient for a detailed inspection such as a private inspector is required to make. The state inspectors are not in the same friendly relation to the corporations as is a company inspector, and they do not feel free to make suggestions that are outside the law. The company inspector should, and usually does, have the authority to require miners or laborers about the mine to leave other work and assist in making places safe.

Some mining-men contend that an inspection, especially of bad roof, does but little good unless the inspector remains at the point of danger until the risk is removed. It is true that in many cases the miner, instructed to timber his place, will not do so or will put off this duty until a more convenient time. Such a delay often proves disastrous.

Foreign miners are more given to taking chances than Americans. They either do not understand the instructions or do not wish to spend time doing anything that is not directly concerned in the making of money. Possibly also the greater number of bosses in foreign mines has led aliens to believe that they will receive a second or third warning before anything happens. I believe that it should be left to the inspector to decide whether he can depend upon the miner or not and whether it is his duty to stay and see that the danger is removed or to go on and spend his time more profitably in discovering new dangers.

Inspection Has Reduced the Frequency of Accidents

The fact that many of the companies have adopted inspection is a testimony to its importance. Because of the safety movement insurance companies now consider mining less hazardous and are planning to readjust their long-established mortality tables.

Inspection has greatly reduced the accidents, both fatal and nonfatal. For a while, after rigid inspection and accounting were established, the nonfatal accidents seemed to increase. This was due to the fact that many minor injuries now reported were formerly not regarded as reportable accidents.

In those days when a man pinched his finger or knocked off a piece of skin he tied it up with a piece of cloth torn from the lining of his coat and said nothing about it. No one then knew he had been hurt except his family, unless the slight injury developed into something more serious. Nowadays such an accident must be reported and counted in the total, and it has its effect on the averages. The apparent increase in accidents was due to such cases, but so great has been the improvement in conditions that now less accidents are recorded than appeared in the old and unreliable reports.

A reliable account of fatal accidents has, however, been kept by the state inspectors for years, and with their figures as a basis it is clear that the number of fatalities has steadily decreased.

Inspectors Aid Safety as Much by Their Presence as by Their Action

The inspector is a periodical reminder of safety, or possibly I should say of danger. He is like the warning-board at a railroad crossing or the big red signal of danger. I am told that some mine foremen "see red" every time he comes about the mine. The miner will "stop, look and listen." He stops only for a short time, and then hurries away to put his caps in their appropriate hiding-place, to examine his powder-box and to place his carbide a sufficient distance from his explosives. This spasmodic effort at safety will soon beget a habit which will continue to grow and will insure the permanency of the safety movement.

Safety inspection, of course, receives its primary sanction from its humanitarian aspect. There are thousands of people yearly saved from suffering cuts and broken bones; there are women and children protected from becoming widows and orphans, from sorrow and poverty. Many of these are subject to a risk they do not realize and cannot prevent. Who is there that will say it is not the business of a company to protect these people when it can be accomplished with a reasonable amount of safety inspection?

Financial Justification of Safety Inspection

But most important is the business side of inspection—its cost and its profits. I call it important because it is the one factor that will keep the work alive and make all the other advantages possible. We are accustomed to consider inspection as an expense with nothing to balance it on the credit side of the ledger. It must, I suppose, continue to be so, for it is most difficult to place an actual cash value on inspection. The work never shows a balance on the credit side of the account. We consider it generally as an expenditure equal to the salary and expenses of the inspector, and this is charged against the cost of coal.

---

*Paper read before the Alabama Safety Association at Birmingham, Ala., Mar. 13.

†Lecturer, Tennessee Coal, Iron & R.R. Co.

The fact that the inspector prevents wrecks on the haulage-road, the caving of rooms and the loss of coal and that he occasionally saves a life valued at $5000 or a mule at $150 are all operating advantages. If we would only be fair to inspection and give it credit for a portion of these things we would find that it is most profitable.

There are a number of states that have compensation laws whereby injuries and the loss of life are paid for at fixed prices, and in these states inspection is becoming a regular part of business. "Safety First" is urged and promoted in such commonwealths in all possible ways.

This law operates to prevent old men and children from getting employment. It is to the advantage of a company to keep out of its employ those who are most likely to be injured. This may work a hardship on some people, but in general will accomplish much good. Companies are requiring their employees to retire at a certain age and are lowering the age limit at which they employ men and raising that at which they will employ children. This self-protection, moreover, is making companies more careful to prevent intoxicated men from going to work.

But the inspector does not economize solely by saving human life. He may also by suggesting some device occasionally save a wreck which would, even if no one was hurt, cause a delay of a few hours and a reduced tonnage. The saving of cars from breakage by this provision may effect an economy of many dollars. The safety inspector may even prevent a mine explosion, but if he does no one will ever know it; but that does not alter the fact that his one act may mean prosperity or bankruptcy for his company.

The man who can accomplish results as a safety inspector should be capable of superintending the operation, must understand efficiency and have both a theoretical and a practical knowledge of the work; for only by having the respect of the employees can he get results.

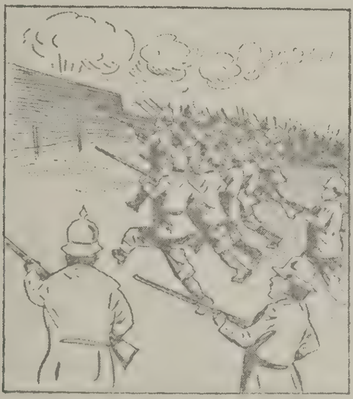
The Alabama Safety Association should, I believe, encourage all employers of a large number of men to put on an inspector, showing them, wherever it is possible, that it is to their financial advantage to employ such a man. The argument of economy appeals to everyone, and so the cynical expression, "We can hire as many men as we wish, but mules cost money," is not so pertinent as it once was.

Inspection is not to be urged alone because it is right, but because it constitutes good business.

⁂

Spain Now Admits Coal Free

A royal decree of April 7, 1915, says *Commerce Reports,* suspends until further notice the import duty and transportation tax on coal, the exemption to apply to all shipments made to a Spanish port on or after the above date. The combined import duty and transportation tax on coal imported from the United States amounted to $1.06 per metric ton (2204.6 lb.). The Director General of the Spanish Customs Department has requested quotations of current prices for coal shipped f.o.b. and c.i.f. from the United States to Spain.



They Fight to Maim and Kill

The Nobler Army

By BERTON BRALEY

Written Expressly for
COAL AGE.

We Fight the Bloodless Battles

The men who fight in Europe—they fight to maim and kill,
They heap the dead in windrows with cold and cruel skill,
They fight to wreak destruction, to lay a country bare,
And death, disease and famine are with them everywhere,
With guns and belching cannon they drive the people forth
To face the raging winter that sweeps from out the North,
The men who fight in Europe with deadly ruthlessness
Have filled the world with terror and sorrow and distress!

The men who fight in Europe—they fight to lay men low;
WE fight with drill and powder, and nature is our foe,
We fight against the darkness, the secret deeps of earth,
To win the buried treasure of which we know the worth;
We fight that men may labor and love and live and dream
Amid the modern magic of iron and of steam,
And all the loot we capture the hosts of toil shall burn
To foil the winds of winter and make the engines turn.

The men who fight in Europe—they fight with courage bold
To make a people hungry and suffering and cold;
We fight to warm the hearthstone, to turn the wheels of trade,
To utilize the riches that God himself has made;
Our army digs its trenches that comfort may increase,
We fight the bloodless battles of industry and peace,
We fight for life and happiness—and not for death and dole,
This army that goes underground to mine the gleaming coal!

Extraction of Oil from Coal

By F. R. Wadleigh*

SYNOPSIS—A brief history of the development of the distillation of oil and tarry products from coal. Typical analyses and yield of cannel coals. Estimated yield and cost of the Del Monte process. Brief outline of method employed. Advantage of low-temperature distillation. A Wyoming proposition—analysis of the coal and estimated yield. Other coals in this country.

The question of extracting oil from coal has been attracting much attention recently in England, owing to the largely increased consumption of fuel oil by the British Admiralty and the growing demand for motor spirits.

Early History and Development

The distillation of mineral oil from the Scotch shales, Boghead cannel and Torbanehill mineral—the latter being originally found in Linlithgowshire, Scotland—has been going on for many years. The first mention of the manufacture of pitch, tar and oil from coal and shale was in 1681. It had become an established industry in Shropshire in 1711. Later experiments made at Bristol in 1779 by the owners of a lampblack factory, on the oil produced from coal at their plant, showed that by boiling this oil it could be reduced to the consistency of tar or pitch. In 1816 mention is made in Holmes' "Treatise on the Coal Mines" of a manufactory at Sunderland for extracting tar, petroleum and ammonia from coal.

The origin of the modern mineral-oil-distillation industry now carried on in Scotland was due to James Young, a chemist of Manchester, who died in 1883. In 1847 Mr. Young began his experiments with the oil obtained from a petroleum spring at Alfreton, in Derbyshire. From this he distilled a light thin-burning oil as well as a thicker lubricating oil. After this supply failed, Mr. Young noticed drops of petroleum coming from the sandstone roof of a coal mine; and supposing that this came from the action of heat on the coal seam, he succeeded after many experiments in obtaining a substance resembling petroleum, by distilling the coal at a low red heat. This substance treated in the same way as natural petroleum gave similar products—chiefly oils and paraffin.

As this process became known, numerous factories were started up, both in Great Britain and the United States. Cannel coal and Boghead coal were used, quantities of it being sent to the United States, where in 1860, according to statistics, there were about 70 factories for extracting oil from coal and other mineral sources, as bituminous shales, etc.

Source of Oil in Coal and Shales

Cannel coals, boghead coals (called also "torbanites") and various bituminous shales have been the main sources of oil production. Torbanites were first worked at Torbanehill, whence the name is derived. They do not look like ordinary coal, but in 1853 the English courts decided that they were coal. In Germany and France, however, they are not classed as coal.

The formation of boghead cannel is now considered to be due to the presence of a large proportion of resinous bodies in the original beds of vegetation, such as lycopodia spores, which, subjected to high temperatures, became more or less liquid and, mixing with the surrounding earth deposits, gave rise to the boghead cannel, having the same organic composition but a high percentage of ash—over 30 per cent. The hydrogen content is high, as is also the yield of volatile hydrocarbons. A typical analysis is as follows:

	Per Cent.		Per Cent.
Carbon	78.10	Fixed carbon	12.20
Hydrogen	10.43	Volatile hydrocarbons	87.80
Oxygen	11.47		
	100.00		100.00

The shales now used in the distillation process, instead of being (like coal) a compound of carbon and hydrocarbons, contain hydrocarbons with mineral or earthy matter, so that they do not coke when heated to redness, but leave from 70 to 80 per cent. of mineral residue. With the exception of the tar oils obtained at gasworks and byproduct coke ovens, the shale oils are the only source of production of high-grade fuel oils in Great Britain. The yield varies from 18 to 40 gal. of crude oil per ton of shale, the average being about 23 gal.

In 1909, 3,000,000 tons of shales, etc., was treated in Great Britain, giving a commercial production of 68,000,000 gal. of crude oil, which yielded by further treatment the following products:

Naphtha	4,000,000 gal.
Lamp oil	22,000,000 gal.
Gas oil	40,000 tons
Lubricating oil	40,000 tons
Sulphate of ammonium	60,000 tons

From the intermediate oils was extracted 25,000 tons of paraffin wax.

Details of a Projected Plant

Following are the important details of a recently projected plant designed to handle 500 tons of cannel coal per day by the Del Monte process, the object being the production of oil and motor spirit:

The chief product obtained will be crude oil, which on being further treated will yield motor spirit, fuel oil, paraffin wax, pitch, etc., in varying proportions, as well as sulphate of ammonium. The cannel coal to be used is not of high grade and is said to be unsuited for other use, being more on the order of Torbanehill mineral, which carries about 10 per cent. of hydrogen. Experimental results have shown that a ton of this cannel will yield 58.5 gal. of crude oil and 54.5 lb. of sulphate of ammonium, together with 58,000 cu.ft. of producer gas.

The total cost of production, including distillation, refining, cracking*, etc., is given as $4.31 per ton of cannel, showing an estimated net profit of $3.04 per ton. The yield on 500 tons will be as follows:

Motor spirit	17.4 gal.	Pitch	51.0 lb.
Heavy fuel oil	17.6 gal.	Sulphate of ammonium	54.5 lb.
Paraffin wax	37.5 lb.		

---

*Mining engineer, Philadelphia, Penn.

*The term "cracking," which is said to have originated in the old Pennsylvania refineries some 50 years ago, means a partial alteration of the oil treated, as distinguished from the more complete decomposition that would disrupt the molecules largely into carbon and permanent gas. The "cracking" simply alters the molecule in a way that cannot be done by simple distillation, and may or may not be accompanied by any considerable production of permanent gas, the product being largely a liquid condensate, though of very different character from that obtained by simple distillation.

Design of the Del Monte Process

The Del Monte process mentioned above is a new one, designed to effect the carbonization of the coal at a low temperature, say from 900 to 1300 deg. F. The retort in which the coal is carbonized consists of a number of mild-steel tubes slightly inclined, the coal being fed in at the lower end and carried up the tubes by an Archimedean screw. Through the middle of the screw is run a tube, and into the upper end of this tube air and gases are injected and burnt. At the same time the exterior of the tube is heated by a series of gas burners, which heat the coal on all sides.

The temperature is so regulated that it is raised from the lower end to just beyond the middle and drops again at the top of the tubes. In operation, a stream of cold gas is forced in at the upper end of each tube and passes through to the lower end. This air current carries off the hydrocarbons liberated by distillation and takes them to the cooler part of the retort where they are condensed.

The advantage claimed for this method is that the yield of hydrocarbons is increased, because they are not subjected to a high temperature that would break them down. The use of low temperatures reduces materially the output of gas from the coal, but largely increases the yield of tar oil, the latter being of good quality, much resembling petroleum. The coke is quite as good as ordinary gashouse coke and suitable for all ordinary purposes. The gas obtained is said to be more than enough for firing the retorts and for the operation of the plant.

A Del Monte Plant in England

At Chiswick, near London, a Del Monte plant has been operating continuously on a commercial scale since Jan. 1; it was specially designed for the treatment of cannel coal and is yielding 130 gal. of oil per ton. Steps are being taken to give the coal operators of this country an opportunity to investigate this process, which may show them a way of utilizing slack and other low-grade fuels. The remarkable results attained in England certainly suggest future possibilities, and coal-mine owners should take up the matter, as they are the ones most vitally interested. There is no question but there are ample supplies of coal in this country suitable for low-temperature distillation that would give large yields of tar oils, as well as sulphate of ammonium.

Proposed Treatment in Wyoming

In 1907-08 a coal company in Wyoming, operating in Uinta County, announced its plan for the operation of a plant for extracting oils from their coal. The chemist reported that the value of the oils that could be extracted was about ten times as great as the value of the slack coal; he also reported that there was a residuum after the oils were extracted that had considerable fuel value and could be briquetted, using the pitch extracted from the coal as a binder. This coal had the following analysis:

	Per Cent.		Per Cent.
Moisture	15.24	Ash	2.91
Volatile matter	37.46		
Fixed carbon	44.39		100.00

The coal contained 0.53 per cent. of sulphur and had a calorific value of 12,084 B.t.u. when air dried. The nitrogen content was 1.34 per cent., and the experimental yield of ammonium sulphate was 26 lb. per ton, while the entire coal-tar product was 220 lb. per ton, the latter being unusually high. I have no knowledge, however, whether this plant is now or ever was in operation on a commercial basis. The above data were taken from a report made by Mr. Peterson, of the Agricultural College of Utah, July, 1908.

Coals Available for Extraction of Oil

There are cannel coals in West Virginia and Kentucky with from 43 to over 50 per cent. of volatile matter and as high as 8 per cent. of hydrogen. There are also coals in this country with a high nitrogen content that would give large amounts of ammonia. Of all coals in this country, probably some of those in Pierce County, Washington, have the highest nitrogen content, many analyses showing over 2 per cent. and some as high as 2.65. The New River coals average about 1.52 per cent. and Pocahontas coals about 1.14 per cent., while some of the coals of the Pittsburgh bed run as high as 1.80 per cent. of nitrogen.

Today the cost of mining these coals is high and the market so limited that they are not being developed to any extent. Their future development may lie in the extraction of oils and byproducts by low-temperature distillation. The Mond process, used largely abroad, yields from 80 to 90 lb. of sulphate of ammonium per ton besides the tar and gas, from ordinary coal having about 1.4 per cent. of nitrogen. Both the Solvay Process Co. and the Pennsy Salt Co. had and probably still have plants of this kind in operation, where producer gas was the prime object and the ammonium sulphate and tar only byproducts. One of the large operating companies in the Pittsburgh, Penn., field is now experimenting along the same lines and has erected a complete plant, using the Mond process, with a modification designed by their own engineer.

In a paper published in the May, 1914, *Journal* of the Franklin Institute, L. C. Jones, of the Solvay Process Co., Syracuse, N. Y., gave some results of experiments made on the low-temperature distillation of coals, for the purpose of determining the nature of the products that could be obtained. These experiments, however, are said to be as yet incomplete. Mr. Jones makes the following suggestive statement:

"At any rate, such slow artificial carbonization is strikingly suggestive of Nature's process. These residues show a decided resemblance to the natural product. That they are not identical, both physically and chemically, may be due to the high pressure used in nature, which we have made no effort to duplicate."

⁂

Course in Coal Mining for Illinois Employees

The Illinois Miners' and Mechanics' Institute, coöperating with the Department of Mining Engineering of the University of Illinois, will offer a short course in coal mining at Urbana, Ill. , from June 7 to July 17, 1915. The same subjects will be studied during the short course as are taken up in the regular schedule of the two-year course, four hours each morning being spent in lectures and discussions and three hours in the afternoon devoted to courses in the mining laboratory, electrical laboratory, drafting-room, surveying on the campus and in first-aid work at the University Mine Rescue Station.

There is no charge for enrollment or tuition, and no textbooks are required other than those furnished free by the institutes.

Economic and Moral Phases of Safety First*

By Milton H. Fies†

SYNOPSIS—Several instances are cited where safety work has largely reduced accidents, fatal and nonfatal. The author shows the effect of safety propaganda on the relations between employer and employee and urges that all work for safety is incomplete so long as it is not accompanied by a movement against alcoholism.

The value and importance of the Safety-First movement—the greatest social advance of our age—no more need proof than the geometrical axiom that a line is the shortest distance between two points. A few years ago the safety movement might have been regarded as a fad; today it is known to be an economy—even more, it is the very foundation of efficient management. The majority of us in Alabama may have been slow to realize the value of this movement: but we are fast beginning to know that safety means humanity, conservation, industrial peace, coöperation and business economy.

Years ago, at the mine we placed output of coal before conservation of life. Railroads were putting dollars first and men second and were mindful of maintenance-of-way, but forgetful of maintenance of men. Steel plants were "making steel and killing men." To quote President Wilson:

> We have squandered a great part of what we might have used; we have not stopped thoughtfully enough to count the human cost—the cost of lives snuffed out, of energies overtaxed and broken, the fearful physical and spiritual cost to the men and women and children upon whom the dead weight and burden of it all has fallen pitilessly the years through.

In the brief time allotted to me I shall discuss only the economic and the moral, or humanitarian, phase, which latter is the most important phase of all.

Railroad Successes in Safety Propaganda

It has been conservatively estimated that the yearly loss in America from disability to workingmen is $250,000,000. Practically all this loss could be avoided. It is a debit due to ignorance and carelessness.

The results obtained from well-organized and concerted safety movements may be illustrated by the following examples: In the first year of its safety work the Chicago & North Western R.R. Co. reduced its deaths from injuries 35 per cent. and its nonfatal accidents 25 per cent. The St. Louis & San Francisco R.R. (the "Frisco" line) in 11 months reduced the deaths on its road 33 per cent. and other injuries 22 per cent.

During the year 1913 the freight and passenger locomotives of the Southern Pacific Co. ran 59,738,000 miles, a distance equivalent to an encircling of the globe every 3½ hours. Nevertheless 41,783,000 passengers were carried an aggregate distance of 1,756,482,000 miles without a single fatality resulting from a train accident. The Harriman memorial gold medal was awarded to the New York Central & Hudson River R.R., in competition with all other great systems, by a committee appointed by the American Museum of Safety. The award was made because in the year ending June 30, 1914, that road, which operated 3,000,000 freight and passenger trains, killed 102 and injured 1063 fewer persons than in the preceding year. This improved record resulted from its safety propaganda. During the year ending Dec. 31, 1914, this great railroad system reduced its fatalities 32 per cent. and its injuries 33 per cent. as compared with the previous calendar year.

Steel Mills Reduce Losses

The results obtained by one of the pioneers in safety work, the United States Steel Corporation, is also remarkable. The most effective work done by any of its subsidiaries was that at the South Chicago plant of the Illinois Steel Co. Even after 1906, the year when the corporation set about establishing universal safeguards and the safety spirit, it was and still remains the leader in safety work in the steel industry. It has reduced its record of injuries 66⅔ per cent. and lowered the number of deaths from 46 until there were only 6 in 1912 and 9 in 1913, 3 of which resulted from heat prostration.

Progress in Mine Safety

In the coal-mining industry the value of concerted and systematic work is proof of its value. Statistics compiled by the U. S. Bureau of Mines for the period between January and October, 1914, show a reduction of 389 fatalities as compared to the same period in 1913. While these figures are gratifying, there still remains much to be accomplished; and in no other occupation is there greater opportunity for effective safety work than in coal mining.

In the West the excellent safety organization of the Colorado Fuel & Iron Co. has enabled it to attain a fatality rate far lower than that of the rest of the state. In 1911 at the coal mines of the Colorado Fuel & Iron Co. there were 19 fatal accidents as against 72 for the balance of the state. In that year the company mined 172,947 tons per fatal accident as against 96,002 in the other coal mines of the state. In 1912 the company had 17 fatal accidents as against 81 in the rest of the state and mined 206,830 tons per fatal accident as against 92,604 for the balance of the state.

Safety First, Quality Second and Cost Third

It is gratifying to know that in 1911, after the Bureau of Mines had become well organized, a reduction of 43 per cent. was made in that class of accidents in which over two men were killed. All efficiently managed corporations realize the value and necessity of "safety first." The H. C. Frick Coke Co. has adopted with decision an uncompromising policy of safety first, quality second and cost third.

I regret that limited time forbids my going into detail as to results obtained by the National Cash Register Co., International Harvester Co., United States Shoe Manufacturing Co. and other progressive business concerns in their commendable efforts to preserve the life and limb of their employees. I have no figures as to results obtained by the Tennessee Coal, Iron & R.R. Co., but its broad-minded efforts, system and efficiency in safety work are a matter of general knowledge, and the officials deserve the praise and gratitude of the entire community.

---

*Paper read before the Alabama Safety Association at Birmingham, Ala., Mar. 13.

†Superintendent Gipsy mines, Maryland Coal Co., Gipsy, Ala.

Moral Phase of "Safety First"

The attitude of employer to employee is of great importance in the United States, as it is a land of democratic traditions and equal privileges. The success of our government is only possible when employer and employee are in harmony. To my mind one of the largest factors toward the solution of this problem is the Safety-First movement. By his interest in it the employer gives evidence of the fact that he is paternal rather than predatory.

Many accidents occur indirectly from the employer's lack of human interest in the employee. Any one who has made a careful study of the characteristics of the workingman knows that he appreciates sympathy and kindness. I believe that the indifference of many men toward their own safety is due to the fact that they feel that no one cares just what becomes of them. The boss' attitude of indifference toward the welfare of his men reacts, and soon the workman becomes discouraged and disheartened. The employee's attitude is immediately reflected in his work, and carelessness becomes his chief characteristic. Aptly is such a man described:

> The emptiness of ages in his face,
> And on his back the burden of the world.
> Who made him dead to rapture and despair,
> A thing that grieves not and that never hopes,
> Stolid and stunned, a brother to the ox?

Laying Overmuch Stress on One Ungrateful Man

You may consider this aspect of the matter purely idealistic; you may insist that it is far-fetched; you may even argue that such a philanthropic attitude is not appreciated. I know that a man who practices this doctrine gets many a hard knock; that he often thinks, "What's the use?" that frequently those to whom he shows the greatest kindness often show the greatest resentment when they have occasion to resent. But I maintain such an attitude does not characterize all workingmen, but only a small minority. A boss may be firm and still remain human. The principles of "safety first" are most effectively applied when an appeal is made to a man's reason and sentiment.

It is generally conceded that safety rules are usually resented by the employee. Especially is this true if they make him perform extra work or put him to some expense or make him deviate from certain of his own fixed rules or standards. This is more particularly the case in large corporations, where the relation between employer and employee is less friendly than in smaller business concerns. There is a reason for this lack of congeniality, and in my opinion it is due to the fact that the relation is impersonal.

The "Verboten" Sign and Its Consequences

Let us consider an example: In a conference of the management of a certain company a change in safety rules is to be inaugurated. The suggested changes affect the employee to his slight detriment, but nevertheless are necessary and right. The general manager writes a letter to the superintendent that on such and such a day such and such changes will be effective.

The superintendent usually copies the letter and posts it about the plant, but in some cases the foreman tells the men that these new rules will be in force after a certain date. The employee never knows why such a change is necessary, and even if he does know the reason an explanation is due him.

Safety with Satisfaction

Cold-hearted, impersonal, "red-tape" safety begets results occasionally, but it does not beget the happiest sort of safety; namely, safety with satisfaction. Superintendents and official heads of large corporations must get away from thoughtless impersonalism if they would successfully fulfill their mission.

The right sort of attitude of employer toward employee will eventually accomplish more in eliminating the prejudice of the public toward the employer than years of expensive publicity work or an insincere interest in applied sociology. In spite of a serious accusation to the contrary, I insist that a man may work for a corporation in an official capacity and still retain his honor and his self-respect.

Big Business Will Suppress Alcoholism

There is one other phase of the moral side of "safety first" to which I would call your attention. I have no interest in the political phase of this subject nor have I any desire to stir up discord. I only ask your consideration because the subject deserves thought. I refer to the relation of "safety first" to alcohol. I believe that the end that temperance fanatics have been unable to accomplish, that a political party has failed to secure, that even religion has been unable to bring about is shortly to come to pass—alcohol is going. Efficiency and safety demand it. Industry calls for it.

Science has shown us the true nature of alcohol; that it is responsible for insanity, imbecility, disease and degeneracy, and now comes "big business" showing us that it is to blame for most of our inefficiency.

Only a Miner Is Permitted to Drink

None of us would employ a timekeeper or a supply clerk or a cashier that drinks; we prohibit our store managers from drinking. But daily, here in Alabama, we permit men to go into our mines, carrying enough explosives to wreck them, whose hands are unsteady and brain befuddled as a result of a previous night's debauch. For such a man a danger-board has no meaning, nor does loose rock impress him. What does he care for his own safety or for that of others?

Let me bring the matter closer home. I have carefully studied the causes of the mine explosions in our state and have found that the incipient reasons of three explosions in Alabama, in which over 200 men lost their lives, may be traced to alcohol.

The railroads have long realized the necessity of taking a stand in this matter. Why should the coal or ore operator lag behind? With the last ten years, the idea was prevalent that a miner *must* have his whisky. There are scores of mine operators who still think this true and accept it as a principle. The coal operator must get away from this rule if he would successfully practice "safety first."

Thomas D. West, manager of a Cleveland steel foundry, writes in the *Survey* as follows:

> The law says to our industries: "If a man in your employ loses his fingers, an eye or a limb, you or your insurance agencies are liable for heavy indemnity." Yet saloons are

licensed to be located next door to factories, to sell employees drink that will weaken their limbs, befuddle their intellects and thus render them liable to accidents that even the best safety appliances and watchfulness of superintendents cannot prevent. This outwitting of justice, commonsense and humanity, supported by laws, is responsible for many of the 2,000,000 injuries and 35,000 deaths that occur annually in American industries.

Wallace H. Rowe, president of the Pittsburgh Steel Co., which employs more than 5000 men, recently filed a petition with the judges of Westmoreland County, Pennsylvania, against the saloon. Mr. Rowe's petition declared that the high cost of living was made more burdensome upon the families of workingmen because 20 per cent. of the worker's earnings, on the average, go to the saloons. At the same time, he said, the cost of steel is increased by an overhead charge for accidents, 85 per cent. of which are due directly or indirectly to liquor.

Railroads Can Have Temperate Men; Why Not Coal Companies?

The Pennsylvania R.R. has 125,000 employees. But so rigidly is the "no drinking" rule enforced that few of them ever touch liquor. During the year 1913 the company's "spotters" made 784,675 "observations," but found only 158 men who were violating the rule against liquor. Surely when a great corporation like the Pennsylvania R.R. will make an average of six observations per year on each of 125,000 men it means to make an end of alcohol in its army of workers.

Most men concede that an effective workingmen's compensation law will soon be passed in every state in the Union, and I for one will welcome it in Alabama. The Safety-First movement is a step toward the preparation for this inevitable system, and in this preparation the saloon must go.

While the Saloon Exists There Can Be No Safety

Machinery may be guarded; safety devices may be installed; human ingenuity may be exerted to the utmost to guard the worker, and in spite of it all accidents continue. While the saloon exists there can be no safety. The campaign of the manufacturer or operator against alcohol is one for "safety first." Public opinion long ago drove the saloon from the church and the school, and it is not going to tolerate it as it directly causes the maiming and killing of men, thus putting a needless burden on industry, labor and the state.

I have laid particular stress on the moral or human phase of "safety first" because if we practice it with this idea in view economic results will follow. The human aspect of this question involves an issue of greater importance to corporations than any other; namely, its relation to the public. As one interested in a small corporation and as one who believes in the good which corporations can accomplish, I have no dread of socialism, but I do fear a public the judgment of which is influenced mainly by the relation of the corporation toward its employees.

Each executive employee of a corporation can become an effective force in combating this evil of a biased and prejudiced public opinion by being considerate in his attitude toward the workingman, by practicing "safety first" and by means of human kindness.

  For the deeds men do together
  Are what saves the world today—
By our common public work we stand or fall—
  And your fraction of the sin
  Of the office you are in
Is the sin that's going to damn you after all.

Safety Meets at the Panama-Pacific Exposition

It has been proposed by H. M. Wilson, the secretary-treasurer of the American Mine Safety Association, that the contestants at all state mine-rescue and first-aid meets pay an entrance fee of $25 or thereabout, the proceeds to be expended for the benefit of the winning team, enabling it thereby to represent the state at the mine safety demonstration and third annual joint field meet of the Bureau of Mines and the American Mine Safety Association, Sept. 23-24, 1915, at San Francisco, Calif.

It is anticipated that this meet may be even larger than that held in Pittsburgh in 1911 in which a team from the state of Washington participated. State meets are already arranged to be held in May at Pineville, Ky.; McAlester, Okla.; Huntington, W. Va.; Billings, Mont.; Moberly, Mo.; Pittsburg, Kan.; Canton, Ill.; Birmingham, Ala.; Fort Smith, Ark., and Des Moines, Iowa. The preliminary program follows:

Sept. 23—10 a.m., mine-rescue demonstration; 2 p.m., first-aid demonstration; 4 p.m., coal-dust explosion.

Sept. 24—10 a.m., first-aid contest for interstate supremacy; 2 p.m., rescue contest for interstate supremacy; 4 p.m., rock-drilling contest; 8 p.m., award of prizes and souvenirs in the Convention Hall.

The following organizations will hold indoor conferences about the same time:

Sept. 17-18, American Institute of Mining Engineers; Sept. 20-22, American Mining Congress; Sept. 20-25, International Engineering Congress; Sept. 22, California state mine-rescue and first-aid contest; Sept. 27-30, National Safety Conference, under joint auspices of the National Safety Council and the California Industrial Accidents Commission (Sept. 28 to be devoted to mine-safety conference); Oct. 6, the World's Insurance Congress discussion on the relation of insurance to mine safety.

"Thank Heaven! It's Over!"

Need of Better Discipline in Mining*

By F. G. Morris†

Recent statistics on coal-mining fatalities in the United States for the year 1914, compiled by the Bureau of Mines, show that 2451 lives were lost, or 334 less than in 1913.‡ Even though this reduction is encouraging, surely we cannot congratulate ourselves so long as so many as 2451 lives were lost. We shall doubtless find when the accident statistics of other coal-mining countries of the world for 1914 are secured that, as in former years, our fatalities have been greatly in excess of those in most countries.

We may reasonably ask, Why should our country suffer the loss of 2451 men, for we know that some other occupations and trades of a more hazardous nature suffer less loss of life per number of men employed and that England, Belgium, Germany and some other coal-mining countries which have more unfavorable natural conditions have a lower death-rate?

A thorough analysis of the nature and causes of all accidents fatal and nonfatal will show that at least 90 per cent. are preventable and only 10 per cent. might be classed as being beyond our power to prevent. The advantage of analyzing the causes of accidents and searching for a remedy is therefore most evident.

Should Not Blame the Law

We do not reason with justice when we place all the blame for our accidents on apparent defects or omissions in our statutory mining laws. We should rather lay the blame at our own door because we have failed to interpret the real intent of our mining laws and because we have not exercised the proper diligence in their enforcement nor made our employees follow the unwritten laws of the industry. The law clothes certain of us with written authority to discipline our subordinates; beyond that, our success in discipline lies in our initiative.

Too often the statement that an accident is due to the carelessness of an employee is thought to exonerate from blame everyone but the unfortunate victim. This is not true; the carelessness may well be due to the fact that the man had never been properly disciplined. He may have been similarly careless several times and his persistence in wrong methods have been overlooked. Finding that disobedience to rules of safety did not result in any personal inconvenience he continued his unsafe practice until finally it proved fatal or he was injured.

Culpability May Be Indirect, but Responsibility Is Clear

Moreover, sometimes the accident arises from the fact that the foreman fails to examine a working-place, being satisfied with the assistant's investigation, which indeed may satisfy the law, but should not quiet the conscience. And the foreman is not always wholly to blame, for he may have too large a territory to supervise or too little assistance. The superintendent may thus be, in part, the guilty party. "John Doe," the killed or injured workman, may have been careless; yet when that has been stated, it does not relieve all others of their responsibility.

Moreover, many men are careless because they do not know how to be careful. They have never been taught. In short, if we would reduce the fatality rate we must not accept the legal requirements as a measure of our accountability, but place the obligations of assuring safety on a high moral plane.

※

Causes of Mine Fatalities in Pennsylvania in 1914

The following official tabulation of fatalities in the State of Pennsylvania during the year 1914 will be found of interest:

CAUSES OF FATALITIES INSIDE MINES AND PERCENTAGE FOR EACH CAUSE, BITUMINOUS REGION OF PENNSYLVANIA

*Brief abstract of paper read before the Alabama Safety Association, Mar. 13, 1915.

†General superintendent, Republic Iron & Steel Co., Sayreton, Ala.

‡Though the fatalities in 1914 were lower than those in 1913, they were more numerous than in 1912 by 91. Moreover, in 1912 more coal was produced than in 1914. The tonnage per fatality in 1912 was 226,469, and in 1914 about 208,078.—EDITOR.

The Labor Situation

SYNOPSIS—The Gallagher amendment fails to pass the Ohio Legislature, leaving the Green Anti-screen act in full force. The validity of the agreement not to strike was finally withdrawn from the court by the Elk Coal Co. A contract has been signed in British Columbia and Alberta.

The Ohio House of Representatives defeated the Gallagher amendment, which would have given the coal operators of Ohio the right to pay their men either on a run-of-mine or screen basis. The Ohio Senate had passed the measure by a good margin, and the House Committee on Mines and Mining had reported out the bill without any recommendation.

The vote stood 53 to 52, but as a two-thirds majority was needed, it would have been necessary under the provisions of the State Constitution for 9 votes to have been reversed if the amendment was to become law. Many members absented themselves rather than vote on the measure. Before a vote on the amendment itself was taken, the emergency clause practically making it effective at once was submitted to the ballot and defeated.

It Is Said that Miners and Operators Are Playing Politics

The eastern Ohio operators are angry and openly declare that the legislators were playing politics. They allege that some of the members of the House do not want the question brought before the Governor for his approval or veto. It is claimed that the tax decentralization bill, a pet administration measure, is being held up in the Senate by those who favor the Gallagher amendment and will not be passed until the House passes the latter. There is little hope that the Gallagher bill will be reconsidered.

In other ways the strike situation in eastern Ohio is unchanged. The operators are still waiting for something to turn up, and since the Gallagher bill has failed of passage some believe that President Wilson and the federal officials will take action—what action is a matter of conjecture.

The miners have been notified that the free seeds of the federal Department of Agriculture have already been distributed to the extent of the congressmen's allotment. Consequently the miners cannot depend on that source for the planting of the small farms which they have secured. A collection is being made for funds, so that seeds may be purchased in the market.

"General" Coxey Signs the Eastern Ohio Scale

"General" Jacob S. Coxey, the one-time famous leader of tramps who invaded Washington in the nineties, is now a coal operator or expects to be. He has signed the 47c. scale with the miners' organization, and has secured an option on the mine of the Meister Coal Co., at Flushing, Belmont County, Ohio, for 20 days, the purchase price being, it is said, $100,000. He has agreed to take back all the men now on strike who formerly worked at the mine. The contract is signed in the name of the Massillon-Belmont Coal Co. It is said he will operate the mine on the coöperative plan. In 1913 this mine employed 105 men.

Meanwhile the Ohio mining department and philanthropists in Columbus have made an appeal for supplies, including food and clothing, for starving miners and their families in the Sunday Creek valley of the Hocking Valley district. Mines in that section have been closed and many of the miners are destitute.

End of the Roseville Litigation

The strike at the mine of the Elk Coal Co. at Roseville, Ohio, was settled last week, and the 145 men involved have returned to work. As has been stated in these columns the coal company discharged three miners for breaches of discipline and all the men went on strike. The union officials tried to keep the men working and to have the trouble adjusted in the usual way, but they failed. Finally the charter of the Roseville local was forfeited by the state union officials. At the same time the Elk Coal Co. brought a suit for $25,000 damages against the miners individually for failing to carry out their contract. The miners countered with a number of suits to collect wages due, amounting to approximately $4000.

By the terms of the settlement the men go back to work, and the cases of the three discharged miners will be adjusted by arbitration under union rule. All of the suits have been dropped.

The men in two of the five mines of the Boomer Coal & Coke Co., Boomer, Fayette County, W. Va., a town on the north branch of the Kanawha River, went on strike Apr. 15 and returned to work on the following day. Two men were discharged as a result of a dispute regarding the yardage rate for the removal of slate. The two men were reinstated by the company, and an effort is being made to obtain an agreement which will remove possibilities of further misunderstandings. There are 1200 men working at the Boomer mines, but barely 500 of these were affected by the strike.

Three hundred men of the Hutchinson Coal Co. at Mason, Mason County, W. Va., a town on the south side of the Pomeroy Bend on the Ohio River, went on strike on Apr. 12. There is a strike also at Mucklow on Paint Creek, resulting in some way from the abandonment of room-driving and the concentration on heading work. It does not involve the Paint Creek Collieries Co.

The Vesta Trouble at an End

The Vesta Coal Co. at its operation at California, Washington County, Penn., on the west bank of the Monongahela River, has agreed to reinstate John Dale as checkweighman, to withdraw the charges against the men and women arrested and the eviction notices against seven men in the company employ. As a result the company will resume work at No. 5 mine. About 800 men were affected by the dispute and consequent strike.

Recent Oklahoma Wage Settlements

On Apr. 10 Peter Hanraty, of McAlester, Okla., the new president of the district union, made an agreement with the Blue Ridge Coal Co., of Chant-McCurtain, Okla., relative to the wage scale. A union-wage contract was also signed with the Samples Coal & Mining Co., near McAlester. This mine is small and produces about 200 tons per day; it has been worked by the Osage Coal & Mining Co., receivers. Hanraty has also made an agreement with the Kali-Inla Coal Co., one of the Bache-Denman subsidiaries operating near Gowen, Latimer County, Okla., on the Chicago, Rock Island & Gulf Ry. This company was involved only as a creditor of the ten Bache-Denman companies which went into receivers' hands as a result of strike violence.

New Agreement in British Columbia and Alberta

A new agreement has been made between the Western Coal Operators' Association and the representatives of the coal miners of Alberta and the Crowsnest district of British Columbia, which together comprise District No. 18 of the United Mine Workers of America. The miners voted on the acceptance of the terms of this contract on Mar. 28, upward of 4000 men casting their ballots. Seven of the locals—Corbin, in British Columbia, and Bellevue, Blairmore, Canmore, Georgetown, Kipp and Nordegg, all in Alberta—voted against acceptance of the new agreement, while 11 favored its ratification. While official figures are not available, it is reported that the majority in favor of the new agreement was about 1200 votes.

The minority showed much strength, for which the increased cost of living and several new clauses in the agreement were no doubt responsible. It is also safe to add that had industrial conditions been more propitious few indeed would have cast their vote in favor of any proposition that did not give an advance commensurate with the abnormally high prices of commodities. The mines throughout District No. 18, which supplies coal to northeastern Washington and northern Idaho and Montana, however, are not being worked on full time, so with the coal supply much in excess of the demand there was nothing for the miners to do but accept the best terms which their representatives had been able to secure.

A Short-Time Contract with Fines for Violations

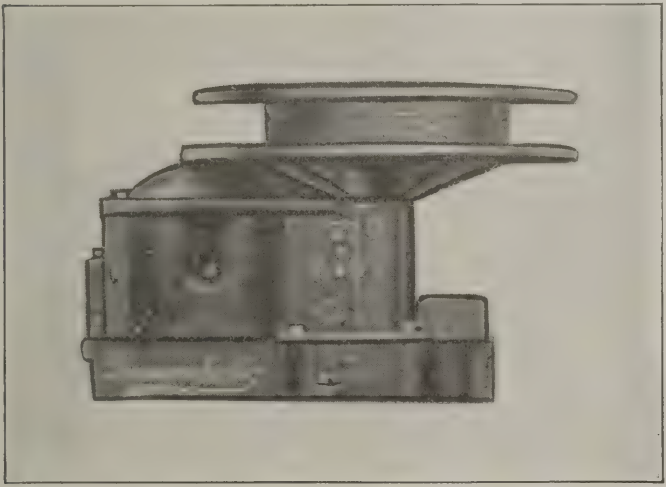
The term of the new agreement is for only two years, while that which expired on Mar. 31 had been made for three. The operators contended for a four-year term, but eventually gave way. The number of persons on the committee for the settlement of disputes was changed, allowing three representatives each for miners and operators instead of one as formerly provided. The procedure for settlement remains as before. To prevent local strikes by the employees and lockouts by the operators, a fine of $1 a day is levied on each man who refuses to work; a similar fine is placed on the operator of $1 a day for every man involved in a lockout. All decisions and rulings in connection with the settlement of disputes under the old agreement stand under the new. It is provided that no rulings of the United Mine Workers of America, either now in force or hereafter passed, shall have any effect on the new contract.

New Apparatus and Equipment

Believing that one of the greatest services that a journal such as Coal Age *can render its readers is to acquaint them with new and improved equipment which may be employed directly or indirectly to the benefit of the coal-producing industry, this department is inaugurated. For the present it will appear in the second and fourth issues of each month. We shall therefore be glad to receive from builders, manufacturers or dealers brief descriptions of new or improved pieces of apparatus in which they are interested, the use of which will tend toward better results in or the economic development of the fuel industry or any of its numerous ramifications.*

Gathering Attachment for Mine Locomotives

It is frequently desirable to use the larger locomotives about the mine for work other than that for which they have been primarily installed. It is often convenient to be able to use these machines for handling a few cars or for even handling one car from points which cannot be reached by means of the trolley wire, such as in the extension of headings, in rooms, around the tipple and under other similar conditions. There are also many occasions when these locomotives are not being operated to their maximum capacity and when they could be used in place of the smaller gathering locomotive with a considerable reduction in the cost of operating the mines on short tonnage.



The Gathering Attachment

An inexpensive, compact and powerful little device has been introduced for this purpose and is being manufactured by the Pneumelectric Machine Co., Syracuse, N. Y. It is called the Pneumelectric gathering-attachment for mine locomotives. It is at present being used successfully and lends itself admirably to the purpose for which it was designed.

A motor built especially for mine service, a low flat spool or drum, motor-pinion, drive-gear and band-brake are the elements making up this attachment, and owing to the few parts involved it will be noted that it is most simple. The motor and gearing are completely inclosed, and fully protected from dust or damage of any kind, while the motor is of sufficient capacity for an 800-lb. rope pull, which is amply sufficient for the work which has to be done by a device of this nature.

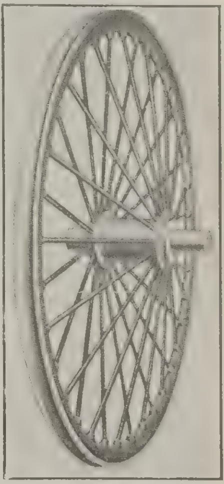
The base is so designed that it can easily be attached to the end frame of the locomotive, and as the extreme dimensions are but 18 in. height, 18½ in. width and diameter of drum or spool over the flange 23 in., it can be placed on any of the standard locomotives without in any way interfering with the operation of the machine in the usual way or occupying space required for any other purpose.

A New Bicycle Type of Hoisting Sheave

The Medart Patent Pulley Co., of St. Louis, Mo., has recently placed upon the market what is called the Medart bicycle type of hoisting sheave. This is not particularly dissimilar in appearance from many bicycle-type sheaves that are at present in use. It is, however, so constructed that expansional stresses in the rim and hubs are entirely avoided.

The spokes may be made of either wrought iron or mild steel, and the rim and hubs are ordinarily composed of cast iron. For extremely heavy duty, however, these parts may be made of semi-steel, which for this class of service is more durable and satisfactory.

These wheels may be furnished in any size up to 15 ft. in diameter, the size of course depending upon the nature of the work to be done and the diameter of the rope or cable which passes over the sheave.



One of the New Sheaves

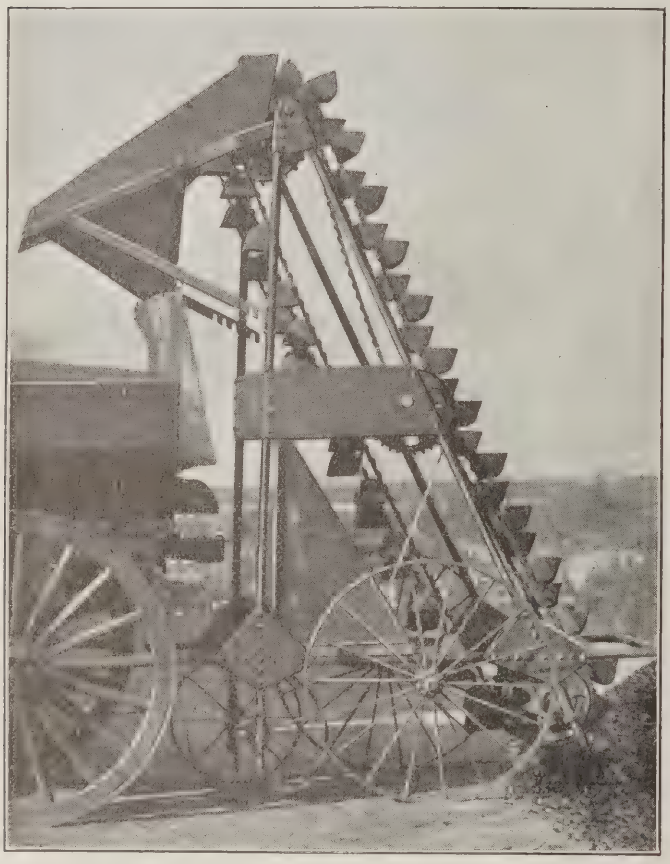
A New Wagon Loader

A new device for loading coal, sand, gravel or other granular material upon wagons from stock-piles or cars has been placed upon the market by the Hudson Machinery Co., Park Row Building, New York City.

This device consists of a triangular framework of pipe mounted upon suitable wheels and carrying a double conveyor chain driven by either a gasoline engine or an electric motor. An adjustable chute, which may be equipped with a screen, is also provided.

This machine weighs 1400 lb. and may be easily handled by two men, while one man may readily move it upon a suitable platform or other comparatively smooth and unyielding surface. When equipped with a 2-hp. motor or engine it will handle from 50 to 60 tons of coal per hour.

The particular advantage of the double chain provided with small buckets is that a more uniform torque is brought upon the engine or motor. This also eliminates the severe strains produced by large buckets. The elevator and chain shafts are all provided with ball bearings, which at once reduce the friction of these parts and render frequent oiling or greasing unnecessary.



The New Loader Filling a Wagon from a Stock-Pile

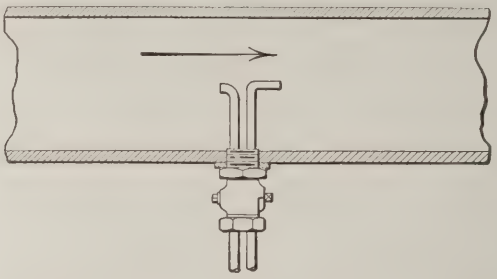
Since the material is delievered from the elevator chain to the chute in a practically continuous and unbroken stream, the efficiency in screening is maximum. A suitable hopper for the screenings is provided, and when it is not desirable to screen the material being handled a plate may be substituted for the perforated screen.

A New Steam Flow Meter

A new steam flow meter which has met with success in England is being placed upon the American market by James G. Biddle, of Philadelphia, Penn. This instrument is known as the Curnon steam meter and is especially applicable to the medium size or small industrial power plant for measuring the amount of steam generated or consumed by any one unit.

This instrument, which draws a continuous curve upon a 24 hr. chart, utilizes the basic principle of the Pitot tube in its measurement of steam flow. The connections in the steam pipe (see sketch) consist of a leading and trailing tube opening; the first squarely facing the flow while the other faces away from it. The difference in pressure registered by means of these two tubes will therefore be in maximum.

This difference in pressure is communicated to the drawing pen through a series of levers so arranged that the height of the line above a given datum is at all times a measure of the number of pounds of steam flowing per hour in the steam pipe. The total amount of steam generated or consumed during any period of time may be calculated by integration of this curve.



The Leading and Trailing Pitot Tube Nozzles in the Steam Pipe

Recent Legal Decisions

Inspection of Mine Machinery—A coal operator cannot delegate to an employee the duty of inspecting a coal-cutting machine or other mining machinery, so as to avoid liability for injury to another employee, but the operator may impose the duty of inspection upon employees who are required to use such machinery, so far as they are competent to make an intelligent inspection, and thereby avoid responsibility for injury to an employee caused by his own failure to make proper inspection of an appliance used by him. (Virginia Supreme Court of Appeals, Hairston vs. Pocahontas Consolidated Collieries Co., 83 Southwestern Reporter 1041.)

Abandonment of Coal Leases—A coal lease covering several tracts of land, and providing different time limits for removal of the coal from them, will be deemed to be abandoned by the lessee where nothing has been done by him under the lease until expiration of the time limits on more than half of the tracts, and after the remaining tracts have been leased to a third person. "Mere nonuse of a right acquired by contract does not, in itself, constitute an abandonment of that right, but nonuse coupled with other circumstances and conditions which expressly show an intention to abandon, when acted upon by the other party interested, has the effect of destroying the rights acquired." (Iowa Supreme Court, Ray Coal Mining Co. vs. Ross, 151 Northwestern Reporter 63.)

Operation of Mines by Independent Contractors—When an owner of coal property contracts with another for its development, he is under no obligation to the latter's employees to provide safety appliances. It is even held that where a mine, with certain existing tracks, etc., was worked under such a contract, the owner was under no duty to provide a derail at the mouth of the mine to avoid injury to miners through cars running away down the track. The miners must be deemed to have assumed the risk of negligence of their coemployees in permitting the cars to escape control, if they knew that a block was the only means of stopping the cars. (Alabama Supreme Court, Connors-Weyman Steel Co. vs. Kilgore, 66 Southern Reporter 609.)

Authority of Representatives—In a suit involving a coal company's liability for a contract made by a representative for purchase of certain mining rights on credit, it is held that where agency is disputed by the person sought to be held as principal it cannot be proved merely by showing declarations of the supposed agent as to his authority. A principal is responsible for contracts of an agent made within the scope of his apparent authority, although they may not have been expressly authorized. An agent has power to pledge his principal's credit only when there is express authority to that effect or the power is inferable from the fact that no funds have been provided to enable a purchase for cash. By retaining the benefits of a contract made by an agent, his principal ratifies the transaction, regardless of whether it was expressly authorized. (Kentucky Court of Appeals, White Plains Coal Co. vs. Teague, 173 Southwestern Reporter 360.)

Editorials

Royalton, Ill., Rescue Work

Some time ago we published an account in small type of the Royalton, Ill., explosion. Our action in thus soft-pedaling the achievement of the Illinois rescue corps was as "small" as the type in which it was printed. Since Layland, we have learned better. For at Royalton, the mine was explored in less than 24 hr. and in foul air.

No one was saved; no fires were extinguished, because no living persons remained in the mine and the coal had not become ignited. But what was done was done right, and had the opportunity presented, men would have been saved and the mine truly salvaged. As it was, it remains a feat which lacked only occasion to make the public herald it as glorious.

It is fortunate that Illinois has such rescue corps, for it greatly needs them. The coal is quite susceptible to fires. Wherever black powder is used it is customary to employ runners to put out the many conflagrations which are started by the shot-firers, and this precaution is often taken even in many mines where permissibles are employed.

In fact in all mines, except perhaps those of Pennsylvania, the risk of coal fires following an explosion and causing another disaster must always be considered, and exploration should largely be done in foul air. The first duty is to look for fire and for live men; a secondary consideration indeed is the removal of bodies and the restoration of the air current.

It is true that the Pennsylvania and perhaps even the West Virginia mine inspectors may be justified in their defense of fresh-air work. In those states it is possible that the advantage of oxygen apparatus is alone in the speed of exploration possible with its help. The main work in those states is to find entombed men. The possibility of fire and a second disaster unless caused by an open light is remote in Pennsylvania. In fact we do not recall a case, though instances of a second explosion are not unknown even in the anthracite region. These secondary disasters have, however, been due to ignition of firedamp by open lights as at the Brookside mine.

To our mind the Layland rescue work is a forcible exhibit of the value of oxygen apparatus, because it shows how slow fresh-air methods must be even with the best of management. No one doubts that the recovery work was valorously and skillfully performed as a piece of fresh-air work; but, like all recovery dependent on ventilation, it perforce must move slowly.

Rescue work with oxygen apparatus is like aëroplane work in war, while fresh-air methods resemble the advance of infantry. In the latter case the roads must be cleared to carry forward props and brattice cloth, the airways must be opened wide to supply air, and the progress of recovery must always be slow. The force engaged must also be proportionately large.

Viewed as fresh-air recovery, the Layland rescue work was a complete success by every account so far published, and also by records hitherto established, but oxygen-apparatus work would have been absolutely safe against the fire risk and more rapid in its performance. To this latter statement exception has been taken, because it has been said that work in advance of the air would have discovered the miners early only to expose them to the foul air and to end in their death.

It is true that had the entombed miners at Layland been discovered earlier by the oxygen-apparatus men they could not have been rescued at that time, and perhaps the rescuers might have been imprudently desirous of breaking into their prison house before the air was made fit and were prevented from so doing by the delay in discovering the men. We should not be asked to assume, however, that such a folly was possible on the part of the rescuers. Had they known where the live men were, safe methods of rescue might well have been put into operation and all the men removed in a short while.

Muzzling the Ox Which Treads Out the Corn

Nemesis follows the unjust, but the unjust do not know it. Such an injustice was well exemplified in a conversation recently overheard. The fate which follows the injustice is perhaps not so obvious, but none the less inevitable.

A coal-man was discussing the ammunition question—just now such an acute subject for discussion—with two representatives of manufacturing concerns. The coal-man questioned whether the charter of a certain corporation manufacturing motors and containing "motor" in its title would permit it to make shrapnel.

In support of the probability of his surmise he instanced a case in his own experience where he had been hampered by unreasonable charter restrictions. He had a plot of ground in Pennsylvania underlaid with both coal and iron and wanted to charter a company to mine both, but found that Samuel W. Pennypacker, then governor, was strongly opposed to granting a charter giving a single company a right to mine all the minerals on one piece of land.

While the coal-man recovered his breath, his two manufacturing friends broke the silence together. It was clear to them, they argued, that a great difference existed between the mining of an essential product like coal and the manufacturing of any article whatsoever. The interest of the public was paramount. The integrity of your coal corporation might possibly be so sullied, if it had too liberal a charter, that the public interest would suffer. "Coal is coal," was the unanswerable argument—unanswerable because it made no pretensions of logic.

When the parties passed out of sight we heard the coal-man in vain protesting that the man who produced an essential of life was performing a service to the community, and in proportion to the importance of his service to mankind should be the solicitude of the public for his welfare. Because he was a benefactor was no reason why he should be plucked and made to pursue his business of mining coal and iron under exceptional restrictions while the man who specialized in billiard tables, golf-balls, ornamental ironwork or motor cars was free. The public did wrong to argue of the latter that "his are minor services; he is a negligible factor in the world anyway; therefore let him get rich as he will; it is no concern of ours." This argument makes a privileged character of the saloon-keeper and the manager of a faro table.

The coal-man was not a logician, but it may be well to add here to what he had to say. The public thinks that, in its private interests, in its desire for cheap fuel, it can override the coal producer. That it may have money for its beer and skittles, it can rob by unfair legislation and dishonest discrimination the man who supplies what we all must have. But justice forbids and the dishonest public must suffer for its folly.

As a result of this false reasoning, this tipping of the scales of justice, the coal industry has become the inefficient tool that it now is. As there are few profits, the plants are wasteful; the machinery installed is half what it should be. There are no coal conveyors in the mine; hand-drilling is universal; steel timbering and ties make slow headway; creosoted timbering is almost unknown; tipples are often of wood, and the houses are of the most impermanent construction.

But worse yet, bituminous coal is shipped to market as coal and not in an improved condition—as coalite, for instance; the byproducts are not taken from it, nor is its power to smoke removed. Of course, the coal is often coked, but even then the byproducts are usually wasted. The corporations which could sell power instead of coal waste effort by shipping fuel to the market, the burning of which pollutes our towns and cities. The lack of profits has held the industry back or long ago the coaling stations along the railroads would have given place to generating power-houses, and the best land would be along the railroad tracks instead of on the hillsides or several blocks from the station.

The coal companies despoiled by continued adverse action can never render the public an efficient service and have drifted steadily into the hands of the railroads as a natural consequence of the pauperization which unlimited competition has forced on the industry. Then the public, seeing the lack of progress of coal mining, baits the business for being unprogressive, for waste, for missing opportunities—for all the follies of which the public is really guilty. With their hands on the gullet of the coal-man they chide him for his reddening and blackening countenance.

Let the public be fair; let it beware of muzzling the ox which is treading out the corn. Fairness always pays. If the miner had not blackened the operator, the public might have permitted the latter to make remunerative prices and might have enabled him to give the miner the generous treatment a successful man can alone mete to his dependents. If the operator would think kindly of the miner he, too, would respond, and the relations would be more cordial. And if the public would unknight the "coal baron" and realize that he is an extremely useful citizen to be encouraged and not like a horse to be checked by the bridle at every turn of the road and jolted at every steep pitch, he might make, after a few years of development and invention, a generous profit at prices which now place him in the bankruptcy court.

⁂

Technical-Book Writing

The writer of a technical book should visualize his reader and try to help the man thus defined. In the early part of many books the author assumes that his reader knows little or nothing. Toward the end that reader, if he is able to assimilate the information offered, must have become a perfect mint of knowledge along certain lines of inquiry, and there is no information contained in the volume whereby he could thus increase his learning in those directions. The book may be instructive in other lines, but it does not contain the key to the technical problems which are lightly passed over in succeeding pages as if already made patent to the impatient reader.

There is room for books for beginners, also for those covering the whole transition from A to Izzard of any department of knowledge, and there is a place for volumes written for the erudite only, but there is no excuse for those books which are ultra-elementary at the start and highly technical in the finish, yet which do not provide the means to pass from the simple to the abstruse.

A book on electricity may be written either for the motorman or for the chief electrician, but having chosen an humble audience the author does ill to forget for whom he is writing and is careless if he casts in a lot of recondite learning the meaning of which is not to be attained without a long course of study. A difficult word here and there can be overlooked, because dictionaries are common, but new concepts, undescribed devices and advanced mathematics are inexcusable follies. The man who buys such a book is like the man who thought he had a ticket from New York to San Francisco and found he had a pass to Chicago and one from Omaha to the Coast and none for the journey through the Middle West. Such a book is written to sell rather than to instruct.

⁂

Indiana Operators Form an Exclusive Selling Agency

Numerous meetings have been held by Indiana operators recently to discuss and formulate plans to organize a selling agency in which all the producing companies will pool their interests, restrict output in accordance with market requirements, and generally coöperate toward eliminating unsatisfactory conditions which have prevailed in the sale of Indiana coals during several years past. Most of the large producing companies have signified their willingness to join this movement, and it is reported that 80 per cent. of the Indiana production will be represented in this coöperative organization.

Wasteful competition has become so serious that the producers who have been opposed to this plan in the past are now willing to promote any reasonable scheme which will promise living prices for their coal. It is stated that the Federal authorities at Washington will interpose no objections to this arrangement if organized on proper lines. This is one of the most important coöperative-sales ventures ever launched in the West, and must, perforce show beneficial results for the Indiana mines and set forth an example which can well be followed by other producing states.

Discussion By Readers

Fire Protection at Mines

Some time ago the necessity for adequate fire protection was discussed in COAL AGE. Notwithstanding the importance of the matter, as was then pointed out, there are but few mines where even ordinary precautions are taken. Some companies, however, have seen the necessity for fire protection and have adopted measures to insure themselves against unnecessary loss.

The system in use at the mines of the Lehigh Valley Coal Co. is, in my opinion, worthy of note and well worth copying. At the mines of this company, in addition to the usual fire extinguishers a sufficient number of fire-plugs are located at convenient points to protect the buildings. Each plug with its 300 ft. of 2½-in. hose attachment has a suitable housing to protect it against the weather.

The hose company at each mine is composed of a chief and five men, all of whom are temperate in their habits and reliable. As they receive extra compensation for the time spent they are always ready and willing for practice. The fire-drills, which occur semimonthly, are held at lunchtime so as to avoid unnecessary interference with the regular work of the mine.

The signal for fire is one long blast of the whistle, followed by a number of short blasts indicating the plug, and this signal is repeated three times.

By constant practice the fighting force becomes very efficient. Immediately after the first blast of the whistle a mad race takes place for the plug, and in a short space of time a stream of water is playing on the imaginary fire. At a recent drill at one of the mines the men covered a distance of 3000 ft. and had the water turned on the assumed fire in exactly 6 min.

Liquor Question in Mining

Letter No. 1—Referring to the liquor question, to which attention has frequently been drawn in these columns, permit me to mention one phase or condition that has not received the attention it merits; that is, the financial burden the drink habit imposes on a community.

I am not speaking now of the upkeep of jails, reformatories, hospitals, insane asylums and poorhouses, although the tax for the support of these institutions would be greatly decreased if the liquor traffic was abolished. An even greater burden, however, is that imposed on the thrifty miner by an improvident neighbor, making donations of clothing, food and money necessary to prevent suffering and starvation in time of distress and need.

A short time ago an incident occurred that is not uncommon in all mining communities. At a meeting of the men of the place, one of the speakers told briefly of the needs of a certain family residing among them, stating that the mother was left with the support of three small children and, being unable to pay the rent, had asked permission to store her household goods in a neighbor's toolhouse. The husband and father of this family, who was a hard drinker, had met with an accident that had crippled him for the time.

It was well known that during a temporary "dry spell" this man had been a "boot-legger." But a community of miners would never permit a fellow-workman to suffer, and a liberal donation was made in response to this appeal, although the givers could each have pointed to dozens of laboring men who, under the same circumstances, would have been able to tide over the misfortune without aid from others. In some communities where saloons abound, the subscription paper is as familiar an object as the pay envelope and in almost every case the trouble can be traced to the drink habit.

The difference between the man who spends his earnings for drink and the man who saves is more pronounced during the periods of enforced idleness so frequent about the mines. At such times the drinking man finds himself without money or credit and becomes the necessary burden of his more thrifty neighbors. If the suspension of work is prolonged, the industrious and sober class often find themselves short of funds; but their credit is generally good in the expectation of an early resumption of work.

At the close of such a period, it happens too often that the sober element face a heavy debt, a large portion of which would rightly be shared by the improvident class who have been nourished and supported by the others, but who now start work free of any recognized debt. To such an extent is this condition of affairs true in mining towns where saloons are permitted that most hard-working miners are beginning to realize that liquor in a mining town is an unqualified evil. But for the burden laid on them as a result, many would be willing to let every man follow his own course of living, pleading as an excuse, "Am I my brother's keeper?" Good judgment and sound common sense, however, lead these men to protest against the drink habit.

These observations are the result of my own experience in this neighborhood, which is a mining community, and I am proud to say allows no one to suffer regardless of whether he is worthy or unworthy of help—necessity is the deciding factor. There is no doubt that this experience can be duplicated in other fields of labor, since no community or industry has a monopoly of either vices or virtues. Let every man who has observed the evil of the drink habit do what he can to suppress it in his own community.

GEO. N. LANTZ.

New Straitsville, Ohio.

Letter No. 2—Having been directly concerned in coal mining, in one capacity or another, for the past 32 years, and for several years having served as mine foreman, I feel the great need of an active campaign against the liquor traffic in mining towns and camps.

I have observed with deep concern the degrading effects of drinking on miners enslaved by the habit. In many cases, the drinking is carried to excess, and Saturday night and Sunday are spent regularly in drinking and carousing. As a result the miner goes to work Monday morning totally unfit for his duties in the mine. Tuesday he is little better; but the last days of the week he bestirs himself and works like a demon in preparation for another carousal at the week-end, which is his regular habit.

The effects of a miner's drinking are not confined to himself alone. He is a source of danger in the mine, not knowing how to protect himself or to safeguard his fellows. My experience and observation have taught me that liquor is the direct cause of hundreds of mine accidents.

Although it is true that the saloon is excluded from some mining camps, in many cases this condition is offset by the work of the "boot-legger." He is a man who is licensed by the Federal Government, through its Internal Revenue Bureau, to sell liquor in any part of the country without molestation by the revenue collectors.

I have made a little investigation on my own account along this line and find that the Federal Government practically holds that on the payment of a small revenue tax the party making the payment is free to engage in the sale of liquor anywhere within the United States, so far as the Federal Government is concerned.

Having this license, the "boot-legger" generally finds it an easy matter to evade the state or county officers. But if, perchance, he is brought into court his sentence is light, and he escapes without a fine by serving from 15 to 30 days in jail. The Federal Government practically says to these men, "You must run your own chance with the state or county authorities, but you will not be molested by this government after paying the license fee required.

As I understand it, the National Administration, through Secretary of State Bryan and Democratic Leader Underwood, refused to indorse the proposed constitutional amendment that would do away with the liquor traffic throughout the country. The reason given for this refusal was that prohibition was a matter to be handled locally by the several states and counties. Nevertheless, without a protest from these "states'-rights" advocates, the Federal Government continues to license liquor selling, even where that selling would be a violation of a state or county law.

Permit me to ask, Is such action consistent in itself? It is well known that "boot-leggers" fear Uncle Sam, who brooks no trifling with his revenue regulations. They do not hesitate, however, to take chances with state and county authorities. To this extent, is not the Federal Government lending its aid to violators of state law? In some cases the court has ruled that internal revenue collectors could not be compelled to testify concerning the business of "boot-leggers" who had paid the internal revenue tax.

I want to ask, Is it not possible to enact a law that will wipe out this scandal? The cry of "Safety first" comes from the North, South, East and West, while its direct cause is licensed by the supreme government. It is my belief that three-fifths of all accidents and crime are the results of the manufacture and sale of liquor, which affects alike all industries of the country. Let us hear from many on this question that so vitally concerns the success and safety of all.

A Mine Foreman.

Roope, Tenn.

⁂

Longwall in the Pittsburgh Seam

Letter No. 6—I want to say a few words in reply to Engineer's Letter No. 2, Coal Age, Mar. 6, p. 431, regarding the working of No. 8 seam in eastern Ohio on the longwall plan. Although the writer of the letter states that he has had "a varied experience in eastern Ohio and the Panhandle mines," etc., I should judge he had not profited by such experience. I can see no ground for his argument condemning the use of longwall in the No. 8 seam, since this method of mining has not been given a fair trial in the eastern Ohio field.

I am well acquainted with the nature of the overlying strata in that section of the coal field and understand fully the bearing that it has on the success of longwall working. My knowledge of these conditions gives me reason to believe that the No. 8 seam in eastern Ohio can be worked successfully on the longwall plan. I freely admit that the limestone, as stated by Engineer, "gradually sags or bends under the enormous weight until it comes to rest on the mine floor." While this effect produced in the strata demonstrates an enormous roof pressure, it does not prove that this pressure is necessarily exerted on the face of the coal.

When longwall work is properly conducted, it is well adapted to avoid the harmful effects of great roof pressure. This result, however, cannot be accomplished by "leaving sufficient pillars," as Engineer seems to suggest or by leaving blocks of coal. Such measures would throw the pressure on the face of the coal and on the entries and roads instead of allowing it to settle firmly on the floor, where it belongs. I want to suggest that where *all* pillars and blocks of coal are removed and sufficient packwalls are well built there need be no fear of the occurrence of an extensive squeeze or any excessive pressure being thrown on the face of the coal or on the entries.

Since reading the letter of Engineer, I have talked with many men in this district who have had from 30 to 60 years' experience in all systems of working coal, and these men have expressed the same opinion; namely, that the longwall system can be successfully applied to the working of the No. 8 seam in eastern Ohio if men are employed who understand that system of working practically and are able to put the system in operation either when opening a new mine or when starting longwall from room-and-pillar workings.

I am informed that the mines on the Norfolk & Western Ry. are working the longwall system, also that a Pennsylvania company has adopted that system at one of their mines. I have also had letters from several coal companies in West Virginia stating that they are going to adopt the longwall system in mines they are operating.

In closing, I want to draw attention to Engineer's statement that "invariably when a superintendent and mine foreman from Pennsylvania take charge of a mine, either in this district or the West Virginia Panhandle, they want to start to draw the pillars as they do in the same seam in the Pittsburgh district." I will say that the roof pressure would not stop these superintendents and foremen from drawing the pillars if a proper system of mining was adopted in those mines. It would then be far better that the pillars be taken out in order to allow the roof to settle firmly on the bottom.

I will say further that there is not a mine in this district that is getting out 85 per cent. of the coal, while in my opinion it is possible by the adoption of the longwall system to extract from 95 to 98 per cent. of all the coal in the seam. I might venture to assert that in some of these mines the coal extracted does not exceed from 45 to 60 per cent. of that in the seam at the present time and with the present system of mining.

Moundsville, W. Va.

Experiences in Rescue Work

The recent references to the Layland mine explosion that occurred Mar. 2, in the mine of the New River & Pocahontas Consolidated Coal Co., as described in Coal Age, Mar. 20, p. 508, recalls my own experiences in rescue work in mines of the Pocahontas region. I am led to refer briefly to these experiences in view of the remarks made by Chief Inspector of Mines R. A. S. Redmayne, in his report of the Cadeby Main Colliery explosion, which occurred in South Yorkshire, England, July 9, 1912.

As stated in Coal Age, Vol. 3, p. 953, Mr. Redmayne in this report condemns the lack of organization at mines, by reason of which men are permitted to enter the mine unauthorized, following an explosion. He is said to have advanced the opinion that "the management of a colliery is not justified in allowing persons to risk their lives in the recovery of dead bodies. There is always great risk of a second explosion when a fire is known to exist underground. It sometimes requires much moral courage to restrain oneself and to prohibit others from undertaking a risk of this nature."

No doubt these remarks were suggested by practical facts in Mr. Redmayne's own experience; but it is a hard proposition to deny volunteers the privilege of entering a mine immediately after an explosion for the purpose of rendering any possible aid to fathers or brothers who may be entombed in the mine workings.

In the past few years the question of rescue work in mines has received much careful attention. Many forms of rescue appliances and devices have been developed, and much useful information and instruction have been given throughout the coal-mining states by the federal Bureau of Mines, by means of instruction cars that travel from place to place in the various mining districts.

Much credit is due to the Bureau of Mines for the great work it has already accomplished along this line, and it is the earnest desire of all well-minded mining-men that this effective work shall continue. It is much to be regretted, however, that there are yet some operations that have not provided such rescue appliances, while they know that they may need these at any moment for the preservation of life and the security of property.

The mining laws of many of the coal-producing states require that the mine equipment shall include such apparatus as will enable the rescue of men from mine workings and the resuscitation of men overcome with gas, besides a proper supply of approved safety lamps, first-aid outfits, blankets, stretchers and ambulances, for the care of the injured. For example, the following sections relating to resuscitating apparatus and rescue crews are taken from the revised (1913) coal-mining laws of Colorado:

> Sec. 89. Every mine employing as many as 25 men underground shall be equipped with apparatus as follows: One resuscitating apparatus, a suitable supply of auxiliary apparatus, and "first-aid-to-the-injured" outfit, including stretchers with a woolen and waterproof blanket for each stretcher and a suitable supply of olive or linseed oil.
>
> Sec. 90. The owner of every mine employing as many as 100 men underground shall endeavor to have trained for rescue work as many as three crews of four men each, and the owner of every mine employing fewer than 100 men underground shall endeavor to have two such trained crews.

My own experiences in rescue work began Feb. 8, 1906, when a local explosion occurred in the Parral shaft, at Parral, W. Va., where I was engaged on a contract of rockwork for the White Oak Fuel Co. The explosion occurred in the evening, just before the night-shift descended the shaft. The water-bailers, as was their custom, had preceded them to bail the water from the working-places, in preparation for the work of the nightmen.

On hearing the report of the explosion, I ran to the shaft and found the cage hung up in the headgear. This was soon released, however, and the mine superintendent and myself descended the shaft slowly by a prearranged set of signals. Owing to the débris blown into the shaft, the cage could not touch bottom, but we succeeded in getting down to the entry and rescued one of the water-bailers who had been thrown down with his mule close to the shaft bottom. This man was taken to the surface and recovered from his injuries completely in a few months—the result of quick rescue work.

Another explosion occurred in the St. Paul district of the Pocahontas mine, at Pocahontas, W. Va., Oct. 3, of the same year, when 35 men lost their lives. A previous explosion that occurred in the same mine, Mar. 13, 1884, killed 112 men, including the general superintendent of the company, who was overcome by the afterdamp on entering the mine for the purpose of rescue.

At the time of the second explosion (1906) I was employed at an adjoining mine, and in answer to a call for volunteers, in company with others, I assisted in the rescue work, which was under the efficient direction of William Lockie, the general superintendent, and T. D. Dennan, a company inspector. Being practical mining-men, these officials quickly organized a rescue party, which was divided into three gangs. A few of the more experienced men were selected to explore the workings ahead of those who were engaged in building brattices and repairing stoppings, while others handled the material and carried out the bodies of the victims as they were found. The necessary tools, safety lamps and materials were soon collected and the rescuers entered the drift mouth, which was protected against intruders by ropes stretched across the entrance and a guard.

Although there were no helmets or other breathing apparatus available at that time and place, the work was pushed rapidly forward and many bodies recovered and the circulation of air restored in the mine. This work was carried as far as the top of the dip workings, when it was thought advisable to proceed no further, owing to the accumulation of afterdamp in that section of the mine. It was decided that a strong current of air would be required to remove the gas from that section so as to make safe the work of exploring. Much credit is due to the practical judgment of those in charge of the rescue work at that time.

The Lick Branch mine, near Switchback, W. Va., which was operated by the same company as the Pocahontas west mine, was visited by two explosions, resulting in heavy loss of life. The first of these occurred Dec. 29, 1908, and was followed a few days later, Jan. 12, 1909, by a second explosion. In the first instance 50 lives were lost, while the second resulted in the death of 67 more persons.

As before, I was one of those who volunteered in the rescue work and was at first employed to inspect the safety lamps before these went into the mine and later to assist in restoring the ventilation in the mine by building brattices as required. The work was well organized under District Mine Inspector William Phillips. The men worked in relays from 8 to 10 hr. each. Chief Mine Inspector J. W. Paul arrived a little later and greatly assisted the work of rescue by his practical knowledge and wide experience, with the result that many bodies were recovered and ventilation rapidly restored throughout the mine.

The second explosion occurred early in the morning, shortly after the miners had gone to work. The only man rescued in this case was Mine Foreman Bowers, who had just entered the mine and had proceeded but a few hundred feet from the drift-mouth when the explosion happened. He was blown some distance by the force of the explosion. His ribs were broken, and the man who was with him was killed. The bodies, in this case, were all recovered within three days. I assisted in the rescue work in both of these explosions, and was overcome with gas in the forenoon of the last day of the second explosion. At that time we were trying to enter some workings where it was supposed bodies would be found.

In the opinion of many practical mining-men, the decrease in the number of mine explosions in recent years is due to the increase of the knowledge of mining conditions and the causes of such explosions. Some believe that the increased use of permissible explosives has assisted in reducing the danger of explosion. However, there are many other factors of greater importance in this respect than the kind of explosives used. Among these may be mentioned the undue accumulation of dust and gas, changes in barometric pressure, sudden outbursts of gas in the mine workings, the use of mixed lights in gaseous mines, and the need of more efficient ventilation, including humidification of the mine air.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

Calculation of the Theoretical Flame Temperature—The theoretical temperature of the flame of a burning gas is the highest possible temperature that results from its complete combustion, assuming (what is never the case in an open-burning flame) that only sufficient air is present for the complete combustion of the gas.

There is always an **excess of air** in the outer envelope or zone of a flame exposed to the air, and this excess of air beyond what is required for the combustion absorbs heat and lowers the temperature of the flame in the **outer zone.**

The temperature within or in the body of the flame more nearly approaches the **theoretical maximum,** which can be calculated. This maximum temperature is found by dividing the total **heat of combustion** above 32 deg. F., per pound of combustible, less the heat rendered latent in the water vapor produced, by the heat required to raise the temperature of the **products of combustion** one degree. The quotient obtained gives the rise of temperature above 32 deg. F., which must therefore be added to it in order to find the theoretical temperature of the flame.

Flame Temperature of Methane Burning in Air—The first portion of the process is similar to that explained in the calculation of the lower inflammable limit of methane and need not be repeated here. It was found that for every pound of methane burned there was produced **carbon dioxide,** 2¾ lb.; **water vapor,** 2¼ lb.; and **nitrogen,** 13.39 lb. So far the two operations are the same.

As before, one pound of methane, burning to carbon dioxide and water at 32 deg. F., develops 23,513 B.t.u. From this must be subtracted the heat required to convert 2¼ lb. of water at 32 deg. into steam at 212 deg., which is absorbed in the **formation of the water vapor;** thus,

$$23{,}513 - 2\tfrac{1}{4}\,(212 - 32 + 966) = 20{,}934.5 \text{ B.t.u.}$$

The result obtained is the **net heat available** for raising the temperature of the products of combustion, which constitute the larger portion of the body of the flame.

It is necessary now to calculate the heat required to **raise the temperature** of the respective weights of the products of combustion **one degree.** The weight of each of these products, as previously given, is multiplied by its specific heat for constant pressure and the sum of these products is the total heat required for each degree of rise in temperature.

	Sp. Heat	Weight	B.t.u.
Carbon dioxide,	0.2163 ×	2.75 =	0.5948
Water vapor,	0.4805 ×	2.25 =	1.0811
Nitrogen,	0.2438 ×	13.39 =	3.2645
Heat absorbed, per degree rise........			4.9404

Finally, the **rise of temperature** in the body of the flame that is possible, in this case, assuming that all of the heat developed is absorbed by the products of the combustion only, is as follows:

Rise of temperature, 20,934.5 ÷ 4.9404 = 4238 deg. F.

This rise of temperature, like the heat developed by the combustion, is estimated from 32 deg. F. The theoretical flame temperature is therefore 4238 + 32 = 4270 deg. F.

The Coal Age Pocket Book

Flame Temperature of Carbon Monoxide—The first step is to write the chemical equation expressing the reaction that takes place when carbon monoxide burns to carbon dioxide, ignoring for the present the nitrogen in the air; thus,

	$2\,CO$	$+\ O_2$	$= 2\,CO_2$
Molecular weights,	56	32	= 88
Relative weights,	1	4/7	= 11/7

Since oxygen forms 23 per cent. of normal air, by weight, and nitrogen 77 per cent., the ratio of nitrogen to oxygen is 77 : 23, and the relative weight of nitrogen involved is

$$\frac{4}{7} \times \frac{77}{23} = \frac{44}{23} = 1.91+ \text{ lb.}$$

Hence, for every pound of carbon monoxide burned, there is produced carbon dioxide, 11/7 lb.; and nitrogen, 1.91 lb.

The heat of combustion of carbon monoxide burning to carbon dioxide, as taken from a table giving the heat of combustion of various substances, is 4325 B.t.u. per lb. of gas burned. There being no water vapor formed in this reaction, the above is the actual heat available for raising the temperature of the products of the combustion, which form the body of the flame, disregarding radiation and conduction losses.

Now, calculating, as before, the heat required to raise the temperature of the respective weights of the products of this combustion **one degree,** by multiplying the weight of each product by its specific heat for constant pressure and finding the sum of those products, we have

	Sp. Heat	Weight	B.t.u.
Carbon dioxide,	0.2163 ×	11/7 =	0.3399
Nitrogen,	0.2438 ×	1.91 =	0.4657
Heat absorbed, per degree rise.........			0.8056

The resulting **rise of temperature** above 32 deg. F., in the body of the flame, which determines the theoretical flame temperature, is then 4325 ÷ 0.8056 = 5369 deg. F., and the corresponding temperature, 5369 + 32 = say 5400 deg. F.

Although the **presence of moisture** (water vapor, H_2O) is necessary to the ignition of carbon monoxide, it is not required to take this into account in making the above calculation, for the reason that the **heat of dissociation** is balanced by the **heat of recombination** in the molecule of water and no loss of heat is assumed to occur. It has been suggested that the water only serves to start the reaction by effecting the ionization of the elements.

The theoretical flame temperature as calculated above, however, both for methane and carbon monoxide, is considerably modified by the **humidity of the air** supporting the combustion.

Volume of Flame—It is frequently estimated roughly that the volume of a flaming gas is proportional to its absolute temperature. For example, assuming the original temperature of the gas as 0 deg. F., the theoretical flame volumes of methane and carbon monoxide are,

Methane,	460 + 4270 ÷ 460 =	say, 10 volumes.
Carbon monoxide,	460 + 5400 ÷ 460 =	say, 12¾ volumes.

Inquiries of General Interest

Gas Due to a Mine Squeeze

In our mine, recently, a squeeze occurred on the cross-entries, shutting off the air supply from those entries, which rapidly filled with gas as a result. The gas could be found within 6 ft. of the main-return airway, but did not seem to have any tendency to mix with the return current.

The peculiarity of this gas to which I especially want to draw attention was the effect it produced on the flame of a safety lamp. The lamp would burn all right, on the edges of the gas, close to the floor, but on being raised toward the roof the flame would be gradually dimmed and finally extinguished. I would like to ask if this gas is nitrogen and what are its properties? Is such gas often found in quantity, as we have experienced in this case?

FIREBOSS.

——, Penn.

In order to properly judge of the nature of the gaseous mixture in this case, it is necessary to consider the conditions existing at the point where the action of the gas was observed; namely, at the mouth of the return airway where the cross-entries join the main return.

Under the conditions described in this inquiry, it is reasonable to suppose that the temperature of the air confined in the cross-entries has risen and is higher than that of the air current passing on the main-return airway. This difference of temperature would cause a slight circulation at the mouth of the cross-entry, whereby the *cooler* air of the main current would set in at the bottom of the cross-entries, while the *warmer* air laden with the gas would issue slowly from these entries at the roof. This circulation is of course local, occurring only at this point and proceeding so gradually as to be imperceptible. The effect, however, is to carry the gas accumulated in the cross-entry upward toward the roof, where it naturally circulates owing to its higher temperature.

This gas observed at the roof is probably a mixture consisting mainly of the depleted air of the cross-entries (which is low in oxygen and high in nitrogen content) and containing also carbon dioxide and, possibly, more or less methane.

In this connection, it is well to note that the stagnant air of the cross-entries soon becomes more or less depleted of its oxygen, which is absorbed in large quantities by the freshly exposed surfaces of the coal at the working face. Also, the action of the squeeze has probably driven out considerable carbon dioxide from the rooms and abandoned and void places in these entries and the adjoining workings.

Therefore, in the absence of any analysis of this gas and further information that would determine its character, it is reasonable to suppose that the observed gas is a mixture of carbon dioxide, nitrogen and a percentage of oxygen that is below the normal. The mixture may or may not contain methane. The depleted air (nitrogen and oxygen) will have a specific gravity less than that of normal air, while the specific gravity of carbon dioxide is much greater and that of methane much less.

Owing to the presence of the carbon dioxide and excess of nitrogen, it would be difficult to observe any cap on the lamp, even if methane was present in considerable quantity. Such a mixture is known as "flashdamp," owing to the quick disappearance of the cap immediately after it is formed. The mixture is extinctive of flame, because of the presence of the extinctive gases, nitrogen and carbon dioxide, and a percentage of oxygen below the normal. Its position in the roof is largely, if not wholly, due to the higher temperature of the mixture and the action of the air setting in at the floor from the main entry, as previously described. This condition frequently occurs in coal mining.

⁂

Broken or Missing Strands in a Hoisting Rope

Kindly answer the following questions in COAL AGE:

1. Is a six-strand wire rope in which one or two strands are missing five-sixths or four-sixths as strong as it was when it contained all the strands? Or, in other words, is it safe to assume that the strength of a wire rope decreases in direct proportion to the number of strands?

2. Again, can a strand be run into a rope to replace one that has come out and the rope be as strong as it was originally?

3. Is it good mining practice to use a wire rope with one or more strands missing?

T. H. WILLIAMS,
Fernie, B. C., Can. Inspector of Mines.

---

1. When one or more strands of a wire rope are broken or removed the rope is unable to resist the strain to which it is subjected, with the same effectiveness, because the strands do not support each other equally as well as when all are present. For this reason, the strength of the rope decreases more rapidly than the ratio of the number of strands it contains, and any estimate based on the former assumption would be unsafe.

2. It is not possible to run a strand into a rope to replace one that has come out and obtain thereby the same strength as possessed by the original rope. This is especially true if the rope has been used for any length of time after the failure or removal of the strand or strands. It will generally be impossible to lay in a strand in a rope in place of one that has been removed so that the new strand will take its due proportion of the load. In most cases such a strand will have a tendency to work out of its place under a load when the rope is in use, owing to the crowding of the other strands.

3. In good mining practice, a rope with one or more strands broken or missing should not be used for hoisting in a shaft. In case of failure, the use of such a rope after its condition was known, if such fact was proven, would render a company liable for the results of the accident.

Examination Questions

Pennsylvania Bituminous Mine Foremen's Examination, April 6-8, 1914

Ques.—State the chief causes of accidents in bituminous mines, from falls of coal, slate, roof and sides.

Ans.—Accidents from falls of roof, slate and coal are due chiefly to the neglect on the part of the miner to promptly timber the roof beneath which he is working and to sprag the coal when undermining the same. The failure to carefully inspect the roof of his working-place before proceeding to load out the coal shot down the night before is a frequent cause of accidents of this nature.

At times a sudden fall of roof in a place or fall of coal at the side or face of a breast is due to the pressure of gas in the strata or the seam. This gas pressure often finds access to a crevice in the coal or to an interfoliated space in the roof strata and becomes distributed over a considerable area and is sufficient to break down the roof or the coal.

Ques.—State briefly the legal duties of a mine foreman and assistant mine foreman.

Ans.—Briefly stated, the mine foreman is required by law to devote his whole time to the charge of the mine when in operation; to keep a careful watch over the ventilating apparatus, airways, travelingways, timbering and drainage of the mine; to see that all stoppings are properly built and cut-throughs made in all room and entry pillars; to measure the air at least once every week at or near the main-intake and return airways and in the last crosscut of the inby room on each entry and the last crosscut in each pair of entries and to record these measurements in a book kept for that purpose; to remove all dangers observed or reported to him as promptly as possible; to see that a sufficient quantity of all needed supplies of timber, iron, brattice boards and cloth, nails, spikes and tools are kept constantly on hand and delivered to the workmen as required.

The mine foreman or his assistant must visit each working-place in the mine at least once every day while the men are at work and carefully inspect all pillar workings, haulage roads, airways and abandoned places in the mine. He must give all needed instruction to the miners in his charge, in respect to mining and blasting the coal and timbering their working-places. He must see that the mining law is fully obeyed. He must enter and sign with ink, in a book kept for that purpose, a report each day stating the condition of the mine and any dangers he may have found to exist therein. He must read carefully and countersign with ink the reports of the firebosses. Once each week he must report to the mine inspector any fatal or serious accident occurring in the mine and any violation of the mining law or mine regulations.

Assistant mine foremen are required by law to assist the mine foreman in complying with the mining act and in his absence to perform his duties.

Ques.—What are the necessary supplies to be kept on hand at the mines for safety, and what action would you take in case such supplies were not provided?

Ans.—To insure the safe operation of the mine, it is absolutely necessary to keep an ample supply of timber of all sizes required in the mine, also brattice boards and cloth, nails and tools. There should always be kept on hand a sufficient supply of approved safety lamps that can be used in case of an emergency. At all gaseous mines requiring the use of locked safety lamps, there should be an ample supply of such lamps of an approved type sufficient for all the workmen. There should be at every mine one or more "first aid" outfits, including one or more stretchers and woolen and rubber blankets. A suitable ambulance should also be provided for use when necessary.

Whenever any of these supplies are insufficient for the requirements of the mine, it is the duty of the mine foreman at once to notify the superintendent and to withdraw the men from the mine until the needed supplies are furnished and on hand, as required in Sec. 1 of Art. 3 of the bituminous law.

Ques.—What observations would you make on your daily examination of the working-places, and what special attention must be given to pillar work?

Ans.—When inspecting a working-place, the mine foreman must examine carefully the condition of the roof to see that there are no slips, fault-lines or other weak places to render it unsafe. He must observe all timbers on the road and at the face to see that they are properly set and in good condition. In like manner he must examine the face of the coal and see that it is properly spragged and safe. He should observe what coal has been shot down and note its condition, so as to enable him to give the miner any needed instructions in regard to loading or blasting the coal. He must note the presence of any gas in the place and see that the ventilating current is conducted in such a manner as to sweep the face. When drawing pillars special attention must be given to the roof to see that it is properly supported over the men. It is important to keep the work in line.

Ques.—What material would you use in the construction of stoppings on main entries, cross-entries and room cut-throughs in order to comply with the requirements of the law and maintain the air currents at the face of the workings?

Ans.—The law requires that new stoppings between the main-intake and return airways in *all* mines and new stoppings in cross-entries in mines generating explosive gas shall be built of masonry, concrete or other incombustible material. The same rule applies to rebuilding old stoppings. Timber stoppings may be built on the cross-entries in nongaseous mines. Temporary stoppings in rooms may also be constructed of timber or brattice cloth. All stoppings must be kept in good condition so as to keep the air current at the face of the workings.

Book Reviews

COAL CATECHISM. By William Jasper Nicolls. Pp. 235 + 14 index; 4⅜x6⅜ in. No ill. J. B. Lippincott Co., Philadelphia, Penn. Price $2, flexible leather.

Perhaps some people do not object to the catechism as a way of imparting information. That is a matter of taste, and a book is valuable or not according to the material it contains and the judgment used in its selection regardless of the manner of presentation chosen.

We think this book stands the test well, seeing that it is intended for "that great number of intelligent readers who have no technical training." It is in nearly every case accurate as it can be made without entering exhaustively into details. The "volatile matter" in coal, however, it says "consists of gases—viz., hydrogen, nitrogen and oxygen. The combustion of these gases is seen in the flame when the coal is burning." This embodies several errors, some of which are not due merely to excessive condensation. For there is a volatile matter given off below boiling point which is wholly incombustible, and that evolved material commonly known as "volatile matter" can by no means all be burned. Much is steam and carbon dioxide. The volatile matter is not a gas in the coal, but a solid, and the gases are not merely evolved, but formed under the action of heat. Possibly neither hydrogen, nitrogen nor oxygen is driven off as an uncombined gas, and if the nitrogen were it would be incombustible.

Does Anthracite Give More Heat than Bituminous Coal?

The writer of the book has a most difficult time comprehending the nature of volatile matter. In answer to question 229, he says, "The richer a coal is in fixed carbon the greater is its heating power." The next answer says, "Anthracites would class higher in value than bituminous coals, weight for weight, owing to the higher percentage of fixed carbon which they contain." In the next answer he gives the evaporative power of Pennsylvania anthracite at 15.56 lb. of water per pound of fuel, whereas he adds, in the next answer, that the power of the best Scotch coal is fixed at 7.74 lb. and that of the best English bituminous at 9.07 lb.

One could not well ask for a better evidence of the faith in carbon of William Jasper Nicolls. But he begins to hedge and admits in the next answer that these laboratory experiments "are not sustained in actual practice or commercially." Then follows a remarkable answer which summarily removes the work of Julius Thomsen at a bound and simplifies thermodynamics marvelously. "It has been proven," he says, "that the heat value of fuel is proportional to the quantity of oxygen which enters into the combination, whatever may be the nature of the combustible. As hydrogen and the gaseous products of its combination with carbon consume much larger proportions of oxygen than the same weight of solid carbon, the presence of these increases the heating power of the fuel."

What wonder then that the author asks, "By this rule which coal would class the higher in value?" And answers, "The heavy gas coals would class higher in value than the anthracites, weight for weight, owing to the higher percentages of gaseous matter and volatile substances which they contain." But again he assures us that his new theory does not work out any better than the old. He says, "We learn that a coal may be high or low in volatile matter or fixed carbon in its chemical analysis and give entirely different results in practice than such determinations would indicate."

After turning over the pages we arrive at question 548; and we have the first statement repeated, "Theoretically, anthracite would be as much better than the bituminous coal as it exceeds that fuel in fixed carbon." Amazing! This is tantamount to saying volatile matter is theoretically as little heat-giving as ash.

But having claimed so much theoretically, he surrenders his whole point, saying, "This" [the superiority of anthracite] "is not the case. Either from the difficulty of combustion or the inefficiency of the mechanical appliances at present in use for generating steam, the excess of carbon in anthracite is not utilized and, generally speaking, a ton of bituminous coal will generate as much, if not more, steam than an equal ton of anthracite."

Now the probabilities are that anthracite coal has been more efficiently used in the past than bituminous and that the reason why it does not give better results than some soft coal under a boiler is because it does not have an equal number of thermal units per pound of fuel.

We would not have taken so much space in exploiting the errors of this writer had not ideas like his been extremely common, having been heard on the street and found in books for years. The fact is, some bituminous coals—usually those which are low in volatile matter—give out more heat when completely burned than anthracite. This is true both theoretically and commercially.

Judging by the statement that anthracite will evaporate 15.56 lb. of water, the author's authorities evidently assumed that Pennsylvania anthracite would generate in a calorimeter 15,000 B.t.u. The pure coal substance would do as much if it could be obtained, but anthracite as found is not by any manner of means so calorific. Assuming, however, that it is, theoretically it would evaporate 15.56 lb. of water from and at 212 deg. Practically it would do no such thing.

Practical Tests of Relative Fuel Efficiency

Unfortunately the Technological Department of the U. S. Geological Survey did not test anthracite under its boiler at St. Louis, Mo. It did, however, test several bituminous coals and evaporated the equivalent of as much as 10.22 lb. of water from and at 212 deg. per lb. of actual fuel. Authorities are of the opinion that better results are obtained under the most favorable conditions.

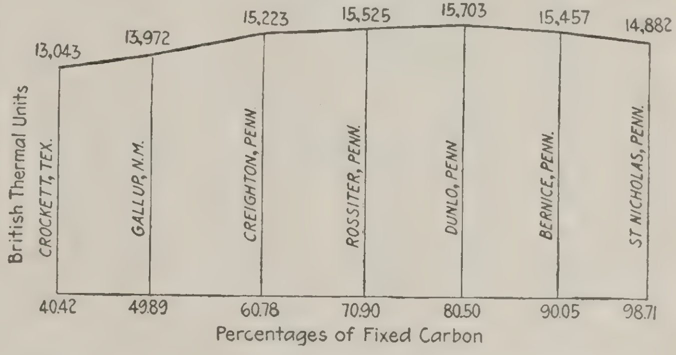

CHART ROUGHLY SHOWING RELATION BETWEEN THE HEATING POWER OF PURE COAL SUBSTANCE AND ITS FIXED CARBON PERCENTAGE

In fact in the Transactions of the American Society of Mechanical Engineers, Vol. IV, p. 267, it is stated that the equivalent of 11.53 lb. of water from and at 212 deg. has been evaporated per pound of Welsh bituminous coal, and even with Pittsburgh Third Pool lump the equivalent of 10.47 lb. has been thus evaporated. It is unfair, therefore, to make the following statement in answering question 232: "A pound of the best Scotch coal by the same experimental tests"—laboratory experiments are evidently meant—"evaporated only 7.74 lb. of water and of the best English bituminous only 9.07 lb." For these experiments could not be similar to those which showed Pennsylvania anthracite as having an evaporative capacity of 15.56 lb., and, moreover, they are experiments bettered in actual practice by many bituminous fuels. The best result we have been able to find with anthracite coal is 9.57 lb. per lb. of fuel.

How Theory Is Corroborative of the Above Tests

As a matter of fact carbon is not nearly as heating on combustion as hydrogen, the ratio being roughly 15 to 62. If, however, the hydrogen in the volatile matter of a fuel is so combined that it may be regarded as partly burned into hydroxide, as is the case in high-volatile coals, then it is of little or no account. The high-carbon coals such as the "low-volatile coal," so called, with less hydrogen of this kind, are the better for its absence. The even higher-carbon coal—anthracite—is also better for the loss of such ineffective hydrogen.

The best coal of all is one that has lost the partly burned hydrogen and the partly burned carbon and has its hydrogen in light chemical bonds, so that in its combustion all, or more than all, the heat is generated which would be furnished by the combustion of pure hydrogen alone. In fact, the best coal is the happy mean between a fairly pure carbon coal and one which is high in volatile matter. Still there are exceptions where the volatile matter though still large in amount is of exceptional heat-giving qualities. Such coals are the cannels whenever they are happily free from high percentages of ash.

Description of Chart

The chart on the preceding page has been prepared for this review to illustrate the fact that the best coal substance is a semibituminous fuel such as that from Dunlo, Penn. The coal substance from Bernice or St. Nicholas, both in Pennsylvania, though higher in fixed carbon, does not have an equal heat efficiency. That from Rossiter or Creighton, in the same state, containing in both cases less fixed carbon, is also less efficient as a heat producer than the coal substance from Dunlo.

By coal substance is meant an imaginary material made by eliminating the moisture and ash in the coal. The whole heat of the fuel is ascribed in the chart to this coal substance and the percentages of fixed carbon and bituminous matter are recalculated so as to add up to 100.

Some Other Criticisms

The other inaccuracies in the book we pass over rapidly. In question 59 we are asked to locate the largest coal basin, and the reply is, "It extends west from the Allegheny Mountains to the Missouri River, a distance of about 1500 miles, and south from the Lakes to the mouth of the Ohio River, about 600 miles." The word "basin" here doubtless means "original basin," but why the coal in West Virginia, Virginia, Tennessee and Alabama and other states is excluded despite continuity of deposit is indeed hard to see. Why include Illinois, Indiana, Michigan and Iowa if these others are to be omitted, for the central coal fields are no longer continuous with those in Pennsylvania?

In questions 152 and 153 the ratio of production between the Wyoming, Schuylkill and Lehigh regions is given as 50, 35 and 15. This proportion was never even approximately correct, but the nearest approach was perhaps in 1878, when it was roughly 49, 32 and 19. In 1913, it was 58, 29 and 13. In question 258 the vexed problem as to whether a bed of coal should be termed a vein or a seam is discussed. We are strictly neutral. We have never been able to see how the vein in a man's arm is less suggestive of a coal bed than the seam of the coat which more or less exactly follows the vein. A seam is a long, narrow, threadlike body just as is a vein. Why in a spirit of pharisaic literary purism make a pother about a difference which really has no existence?

In question 319 the writer describes the method of mining in a bituminous mine and carefully explains how a squib, iron needles and iron tamping tools are used and how coal dust is used for tamping. The purpose of such a book should be to describe good practice and not such methods as violate the law. Of course, squibs are not illegal though they are not advocated, but the use of iron needles, iron tamping tools and coal dust is forbidden in most states.

In answer to question 332 we are told that carbon monoxide has the faint fragrance of violets. It may be so; we would not like to give it a nasal test, seeing that less than 1 per cent. kills in a few seconds. We are told in answer to question 342 that about 3 per cent. of sulphureted hydrogen "is all that is necessary to cause death." An excellent authority, Lehmann, puts the percentage causing rapid death at 0.1 to 0.2 per cent., about $^{1}/_{20}$ of the figure just quoted.

In answer to question 348 we find that the average of fatalities among miners by gas explosions and otherwise is one miner for every 100,000 tons. The Bureau of Mines estimates that one life was lost last year for every 208,078 short tons produced. The loss of life has never approached the level of one man per 100,000 tons. In 1907, for instance, the year when mine fatalities reached their zenith, the rate was one man per 144,325 tons.

A foot-pound is, as stated in answer to question 523, "a unit of work." It is not a rate of doing work. It is erroneous to state, as in the text, that it is "the energy exerted in raising or lifting one pound in weight one foot high in one minute," for the time during which the work is achieved is not a point at issue.

In answering query 525 the unit of heat is the Fahrenheit degree; on the next page, without a statement to explain the difference, the Centigrade degree is taken. Thus the coal in one case generates 14,500 "heat units" and in the other only 7500 "heat units," and the author does not help the reader to a realization that the two coals are only 1000 B.t.u. different in value and that only the units of measurement are really different.

In the answer to question 626, the writer takes the old-fashioned view that coke should be bright and silvery. As a matter of fact, much of the best product of the byproduct oven cannot be so described, nevertheless it is equal to the best. Of course, the author favors coke as a fuel because it contains so much carbon. He overlooks the fact that the volatilization increases the ash percentage considerably to the detriment of the heating power and in some cases removes much valuable hydrogen.

We would not spend so much time checking these errors did we not know that this book has gone far afield, has been reviewed in foreign technical journals and has seen three editions. Nor would we even then give so much space to mere comment. The errors we have pointed out are common, and they may as well be met with this readable book as a text as be given place without such reference.

⁂

THE MAN WITH A JOB. By Wightman D. Roberts, Huntington, W. Va. 16 pp.; 3¼x6 in. Price 10c. Stiff paper cover.

There is need for much literature such as is found in this little booklet. Only we wish Billy Sunday or some novelist had written it. If only Frédéric Bastiat were still alive, who wrote such wonderful little tracts of this sort for the French Government, or if Maria Edgeworth were still living, what might not be written on such a subject. But they are not, and this little book occupies the field all alone.

In the first chapter, the miner talks about the casting of all jobs into a "jack-pot" under a socialistic government. But, as these workers believe, however untruly, that any other job is better than coal mining the idea of exchanging it will not terrify them. Then he reviews the fact that all occupations have their drawbacks, usually much exaggerated, it is true, but all are far less delightful than the life seen in our visions.

Not Freedom, but Only a Change of Masters

In the second chapter the miner discovers that instead of being free under socialism he is only to change masters while his property is to be divided up among the deadbeats. He is struck by the fact that he has no future to work for and that life will be a deadly level. He says that if he doesn't like one company now, he can wander off to another. But in the socialistic days, if they come, he must grin and bear conditions as he finds them. There will be only one commonwealth, and if he is elected to a bad place in the mine, elected he will be without opportunity for change. He will be like a minority stockholder in a big corporation—unable to change conditions, for his vote won't count. He won't be able to get up and "beat it" to a place where conditions are better.

Then again, if any men decided to quit work entirely, what would be done to change their decision? If the government then took care of those men there would be no incentive for them to work. It will be a choice between "Let George (the man who is willing to work) do it" or else the application of force. Either the lazy will do as they please or government will have to make convicts of them. The lack of opportunity will take the ginger out of all of us.

After All, the Coal Is Not Going to Dig Itself

Of course we might rise to be bosses and managers, but the miner recalls that bossing is just what he has been denouncing for years. And as the miner thinks it over he is sure that the coal is not going to dig itself. The drudgery has yet to be done. In the last chapter the miner concludes that though he has not now all that he wants, the change is not likely to better him.

Liberal discounts are given for large numbers of these books. If a list of persons is furnished, copies will be sent direct to them from Huntington, W. Va.

This little book has received the most favorable comment from mine officials. J. J. Ross, general manager of the Logan Mining Co., writes us personally indorsing it and saying that his company has distributed many copies. All the members of the Kanawha Operators' Association expect to use it, and it has already been distributed by the Consolidation Coal Co., the Hutchinson Coal Co., the Carbon Coal Co., the West Virginia Colliery Co., the Republic Coal Co., the Slab Fork Coal Co., the Columbus Iron & Steel Co. and the West Virginia Pocahontas Coal Co.

⁂

ELECTRICITY IN COAL MINING. By David R. Shearer. pp. viii + 80 + 4 index. 6x9¼ in. 28 ill. McGraw-Hill Book Co., Inc., 239 West 39th St., New York City, 1914. Price $1.50, cloth boards.

This book treats on the application of electricity to signaling, haulage, coal-cutting, ventilation and pumping and is probably as complete as can be compressed into 80 pages with illustrations. Some elementary facts relative to electricity appear in the earlier chapters and information is given as to power equipment and repair shops. In the appendix are valuable tables and other useful data.

Coal and Coke News

Harrisburg, Penn.

Legislative investigation of the allegations that anthracite coal producers and retailers have been making extortionate charges for coal under the guise of the state enthracite tax was determined upon at a conference between Governor Brumbaugh, members of the Republican platform committee of the two houses and the chairmen of the appropriations committees on the state revenue situation.

The primary object of the conference was to secure an agreement on revenue-raising measures and it is believed that about $5,000,000 can be secured for highway improvement by enactment of proposed laws, among them being the anthracite tax bill, but which is in danger of being killed by the members of the nine anthracite counties, if a 50-50 division is not made.

Resolutions calling for the investigation will be presented at an early date. This investigation will go into the sales of coal producers and retailers, which according to reports received here from time to time have been made at prices far in excess of what would be justified by the state tax.

Attorney General Brown in telling about the conference said.

> The conference felt that a division of the anthracite tax, 60 per cent. to the state and 40 per cent. to the anthracite counties would be fair. The tax proposed in the pending bill is about 5 cents a ton. At this rate the gross amount of revenue would be about $4,500,000. The conference discussed the advisability of increasing the tax to about 7½ cents a ton (the bill reads 2½ per cent ad valorum), which would bring in $7,000,000 a year. The state would have to take out 1 per cent. of its share for collection.
>
> The conference decided that a state commission would be created to investigate the charges that anthracite coal prices have been raised exorbitantly because of the tax. This commission would also look into any future extortionate rates. It and the state would fight any attempt to increase the price per ton to a larger sum than the regular selling price of coal with the tax added. We would resort to the use of bulletins, sent broadcast over the state, and to first page advertisements in newspapers if necessary.

The governor and his attorney general will hold a conference with the representatives of anthracite districts during the latter part of the month. The governor is willing to grant 40 per cent. to the anthracite counties, and the state to pay all expenses incident to assessing, collecting and distributing the tax. The anthracite districts will receive 40 per cent. net. The Governor figures the counties producing anthracite will receive 11 per cent. of the 60 per cent. the state receives, and arrives at this through a study of the highway maps of the state. He is desirous that the Legislature act quickly on the bill and put it through. The members of the Senate and the House, contend that as the coal companies in selling surface rights "reserve everything but the wind" and there is no redress to the municipality or individual property owner for loss which may be occasioned by mining operations, the municipalities should receive 50 per cent. of the tax. Some members think the distribution should be made on the basis of production rather than population of the municipality.

Bituminous Miners and Compensation

A bill designed to bring the bituminous miners of the state under the provisions of the proposed workmen's compensation act has been presented in the Senate by Senator Martin, of Clearfield. The bill is somewhat similar to the one now before the Legislature, presented by Representative Dawson to bring the anthracite miners under the proposed law.

Under the present law mine foremen must be selected from among men who have been granted certificates by the state. Under state rulings coal companies are not responsible for the acts of mine foremen because the companies did not have the right of free selection of the men. Under the bill presented by Senator Martin the company may select foremen without regard as to whether they have certificates or not and mine employees are brought under the direct supervision of the operators.

Representatives of the United Mine Workers are confident that the Catlin bill to bring miners under the workmen's compensation act will pass the senate at an early date. Numerous conferences have taken place during the week between miners, operators and senators on the committee of mines and mining. Senator McNichol has stated that the Legislature will not adjourn on May 5 if the Catlin bill is not passed.

A bill to amend section 1 of article 8 of the Act of June 1911 applying to bituminous mines has been introduced by Representative Milliron, to give the mine inspectors power to compel the adoption of such safety and locking devices on cages used in lowering and hoisting persons as will prevent the accidental tipping of cages.

A bill which makes many changes in the miners' certificate act of 1897 has been introduced by Mr. West of the Mines and Mining Committee, the amendment (Section 5) reads as follows:

> That it shall be the duty of each board to meet once every month and not oftener, and said meetings shall be public and if necessary the meeting shall be continued to cover whatever portion may be required of a period of three days in succession and examine under oath all persons who shall desire to be employed as miners in their respective districts and the said board shall grant such persons as may be qualified, certificates of competency or qualification which shall entitle the holder thereof to be employed and to do the work of a miner as may be expressed in the said certificate and such certificate shall be good and sufficient evidence of registration and competency under this act and the holder thereof shall be entitled to be registered without an examination in any other of the anthracite districts upon payment of the fee herein provided.
>
> All persons applying for a certificate of competency entitling them to be employed as miners shall be not less than 21 years of age and shall have had at least two years' experience as a miner, miner's laborer or a man of general work in the coal mines of this country or of other countries and in no case shall the applicant be deemed competent unless he appear in person before the examining board to answer 12 questions in the English language pertaining to the requirements of a practical miner. He shall demonstrate that he understands the use of safety lamps, knows how to handle explosives and is competent to do the work of a miner without injuring his own life or the lives of others.
>
> Said boards shall keep an accurate record of the proceedings of all its meetings and in said record shall show a correct account of the examination of each applicant with the questions and their answers and at each of its meetings the board shall keep such record open for public inspection. Any miner's certificate granted under the provisions of the act or any prior acts shall not be transferable to any person or persons whatsoever and any transfer of the same shall be deemed a violation of this act. Certificates shall be issued only at meetings of said board and said certificates shall not be legal unless then and there signed by at least three members of said board.

Senator Lynch, of Lackawanna County, has introduced a bill to regulate the mining out and removing of coal under streets, alleys, public highways, etc., in the anthracite region.

The bill provides that any municipality in the anthracite region may create a Bureau of Mine Inspection and Surface Support, with a practical mining engineer in charge. The bureau is to have the right and power to enter and inspect, examine and make surveys in any mine at any time, and to take such persons as may be necessary for such examinations, surveys, etc. The bill provides that every operator shall within three months after the passage of an ordinance by any municipal corporation creating a Bureau to furnish the Bureau with an accurate map of the mine workings on a scale of 100 ft. to the inch, and place thereon the extensions made at least once every three months.

The proposed law prohibits any mining under streets, alleys, etc., to such an extent as to remove the necessary and adequate support of the surface against subsidence, without first having built sufficient, adequate and permanent artificial support in such place to maintain and preserve the stability of the surface. Before the coal is removed the operator will be compelled to give 30 days' notice to the bureau of its intention to so remove the coal under the streets, etc., the Bureau is given power to apply for injunction to stop mining under any street, but must give the operator written notice of its intentions, at least 24 hours before application is made.

A bill to increase the salaries of the mine inspectors of the state from $3000 to $4000 per annum has been introduced by Representative Evans.

Until the governor declares his purpose in withdrawing the Tenor appointments as commissioners to the Public Service Commission his intentions will not be known. But it is a good guess that he contemplates something out of the ordinary. If he were satisfied with the constitution of the commission or its personnel he could have left the appointments undisturbed. The senate has not yet confirmed them.

PENNSYLVANIA

Anthracite

Tamaqua—The Nesquehoning breaker of the Lehigh Coal & Navigation Co. is turning out 500 tons of coal each operating hour.

Beaver Brook—The Duggan stripping operations were tied up on Apr. 14, by a strike of 200 employees. They claim that the owner, Harry Duggan, of Hazleton, had refused to meet the committee that demanded the payment for two shifts worked in March.

Larksville—Many houses were damaged, water and gas mains were broken and damage to the extent of thousands of dollars was done by a cave-in in the Bennett and Cooper veins of No. 5 colliery of the Delaware & Hudson Co. on Apr. 15. The caved district takes in about two acres in which there are many deep holes and depressions. A number of homes were badly wrecked. The home of Thomas Temperine was broken in two by the cave-in and is a total wreck. The cave-in twisted and turned over buildings on their foundations and some of the structures are greatly tilted. Walls and partitions of the buildings have been damaged so badly that they can never be repaired. The bursting of the water mains caused the company to cut the supply, and all fires in the cave-in area were ordered quenched and all lights ordered extinguished.

Carbondale—Charles Enzian, of the Federal Bureau of Mines and City Engineer Saxe, of Carbondale, estimate that it will cost $90,000 for the proposed attempt to smother the mine fire that has been raging under the city for a number of years.

Bituminous

Jumbo—In a suit against the Pittsburgh Coal Co., Amelia Janofski, seeks $10,000 damages by reason of the death of her husband, killed in a mine of the defendant coal company. The accident occurred on June 9, 1914. Acting under instruction, it is averred, the husband was sent into a part of the mine to work that was dangerous. It is averred that prior to the day her husband was killed there had been various falls of roof which fact, it is claimed, was known to the defendant company. The husband of the plaintiff was caught by the fall of a large piece of rock and crushed to death. It is alleged that prior to the accident the mine foreman had promised to send a crossbar to prevent the roof from falling, but failed to do so.

Fredericktown—As the result of rioting, in which women were leaders, around the mines of Vesta No. 5 of the Vesta Coal Co., at the opening of the mine recently, after a long shutdown, 20 men, 13 women and 7 babies were lodged in the county jail. The trouble arose over the company's action in discharging John Dale, a check weighman and an employee whose dismissal is decided by the union. The company has agreed to take back the discharged weighman, and that eviction notices to seven miners' families whom the company had refused to allow in its employ should be withdrawn.

Meadowlands—The mine of the United Coal Co. recently began operations with large orders for lake shipments. During the past few months this mine has been operated three to four days per week with only about one-half the plant in active operation. The prospects are good for active work throughout the entire summer.

Pittsburgh—The caving of old mine workings recently caused two houses in Climax Street to settle so that the doors had to be forced open in order to extricate the occupants. At five o'clock in the morning the tenants of these houses were awakened by jarring and rumbling. They tried to escape, but the doors could not be opened. An investigation showed that the land had settled several feet, due to collapsing of old mine entries under the property.

Connellsville—The weekly production of Connellsville coke recently attained 292,000 tons with shipments aggregating 288,000 tons. It is thought that the 300,000-ton mark will be reached before May 1. There have been practically no idle ovens fired recently, but the running time of those in operation has increased.

WEST VIRGINIA

Mason—About 300 men working in the mines of the Hutchinson Coal Co. are on strike, as the result of a difference of opinion regarding the driving of entries. The company wanted several entries driven, and agreed to let any man who wished to do so work them, furnishing all the cars needed in order to facilitate the work. The men working in the mine proper objected to this, for the reason that they did not get as many cars as the men working the entries, and the strike resulted. Union officials are endeavoring to adjust the matter.

Huntington—Operators representing 75 per cent. of the coal-tonnage production of West Virginia were present at a meeting here on Apr. 12, at which the West Virginia Coal Association was organized, for the purpose of promoting the interests of the industry in the state in every way possible. A permanent organization will be perfected on Apr. 30, a constitution having already been formulated and sent out to various district associations for ratification. J. W. Dawson was temporary chairman, and A. H. Land secretary of the meeting.

Betterment of market conditions and plans to decrease fluctuations in price were discussed at a recent meeting of coal operators from the high volatile field. This meeting followed the adjournment of the session of the West Virginia Coal Association. Although state operators generally declare that bad working conditions are universal, the condition of the splint gas-coal market is said to be especially bad because of the keen competition and the unsteady condition of the market.

Roderfield—Three men were killed in a mine of the Davy-Pocahontas Coal Co. Apr. 17, when a pocket of gas was exploded by a shot. Only six of the 200 miners usually employed in the pit were in it at the time of the explosion.

Elverton—The Branch Coal Co. recently suffered the loss of its power house and a portion of a trestle by a fire which originated in the engine room. This loss it is thought will reach $25,000, but was fully covered by insurance. The company will begin immediately rebuilding and expects that work will be completed in 30 days.

Bluefield—A persistent rumor is current throughout this section that an effort will be made, or rather is already underway looking to the organization of the coal miners. It is said that parties other than the miners are promoting a movement to have the miners organize. It is believed that the present is a most inopportune time for such a movement. At no time in the field's history could the mine managers better afford to close up shop than at the present.

Fairmont—The Annabelle mine of the Four States Coal & Coke Co. recently began operations with a force of 650 men, after a shutdown of several months. It is stated by company officials that more miners are needed and that within the next few days 300 more men can be employed. During the past five months the miners at the Annabelle plant worked only 23 days. The opening of the Lake trade giving an outlet for shipments caused the resumption of operations.

Montgomery—March coal loadings were far below normal in the Kanawah and New River fields, and the month was a discouraging one for local operators. There was a gain of 30,000 tons over February in the New River district, but a loss in the Kanawha district of 30,000 tons. Compared with March, 1914, there was a loss of 157,000 tons in the two districts. It is believed that conditions through April will show improvements, as all mines in both districts have been working a little better thus far.

ALABAMA

Birmingham—The Committee named by the State Legislature to look into the matter of conditions at the camps employing convict labor, with the view of abolishing such labor in the mines, made a recent investigation of the conditions at all convict camps, and reported that existing conditions were not as bad as reported, that sanitation conditions were good; that the food was clean and wholesome, and that their investigation failed to find that convicts had been cruelly treated.

KENTUCKY

Whitesburg—Coal shipments from the McRoberts-Fleming coal field of Letcher County have increased greatly since the 10th of the month. The Lexington & Eastern is now carrying out from 125 to 150 cars per day—this to be increased to about 200 cars May 1.

A big party of coal operators, capitalists and others, including Congressman Slemp; W. S. Dudley, of Carlisle, Ky.; John E. Buckingham, of Paintsville; Johnson N. Camden, and others, have just completed an inspection trip over the Letcher-Perry coal fields especially along the North Fork extension of the Lexington & Eastern R.R. With the party were a number of West Virginia operators who it is said are projecting leases of certain of this land.

Hazard—The Lexington & Eastern announces that more coal was shipped over that road from the Perry County coal field the past week than in any previous week in the history of its development. There has been much improvement in market conditions owing, it is said, to the opening of the markets of the Lake region.

OHIO

Brilliant—The tipple of the Dexter Coal Co.'s mine was destroyed by an incendiary fire Apr. 14; this put 135 men out of work. It will take some time to rebuild the tipple, and whether or not it will be rebuilt at all is not known, as the mine has not been operated at a profit.

Bridgeport—It has been estimated by one of the officials in charge of the strike of eastern Ohio coal miners that over 25 miles of fences will have to be constructed in Belmont county by striking miners to surround their community gardens. These gardens have been started in many mining camps, and it is the intention to raise vegetables and field products during the coming summer. Large Chicago and Pittsburgh wholesale seed houses have promised to extend every assistance to the miners and their officials.

Gen. Jacob S. Coxey, best known as the head of "Coxey's Army," has secured an option on the mine of the Neister Coal Co. at Thrashing, Ohio, for 20 days, at a price said to be about $100,000. It is reported that Gen. Coxey intends to take up the option and operate the mine on a coöperative basis.

Gloucester—At a meeting of officers of the Sunday Creek Coal Co. and representatives of the miners' union held here recently, to discuss the matter of loading "dirty coal," it was declared by the union men that any man following this practice would have to stand on his own responsibility, as the union would not support him. One of the points made by the operators in opposing the mine-run law in Ohio was that under it men would load dirty coal, thus rendering the product unmarketable, but the union men took the position that this was an unwarrantable charge. Now that it has happened, as the operators assert, they look to the union to break up the practice. It is especially important to the operators that it be eliminated at this time, as only the best coal can be marketed.

Steubenville—Fire destroyed the tipple of the Dexter Coal Co. at Brilliant, Ohio, last week. The origin is believed to be incendiary.

Columbus—Only slight opposition developed in the Ohio Senate last week to the enactment of the Moore bill, giving coal companies the right of eminent domain. The bill gives coal companies the right to condemn a right-of-way through private property when necessary. The bill now goes to the House of Representatives for consideration.

Roseville—The Elk Coal Co. has settled its differences with the 140 men employed in its mine and the latter have gone back to work. The suit brought by the company against the union and its officials for $25,000, for breaking their contract and closing the mine by striking, will be dropped. The union charter of the men, which was revoked on account of their unauthorized strike, has been restored, and the miners' attachment suit for $4000 in wages has also been dismissed.

ILLINOIS

Edwardsville—An unusual action was taken Apr. 16 in the Madison County Circuit Court, when the court gave the defendant's witnesses the option of testifying the way the court suggested, or having the case thrown out. This was a damage action for $5000 against the Madison Coal Corporation. The defendant witnesses would not state to the court whether the corporation had elected to come under the provisions of the Illinois Compensation Act or not. They declined to identify a notice that they would come under that act, which they had posted on their bulletin. The court said it was a matter of common knowledge that the company had led the miners to believe they would come under that act, and when a suit came up they refused to admit that agreement. There is much dissatisfaction felt among the coal operators in the state over the action of the defendant, bringing into ill repute the operators in general, who support this measure.

Chicago—Readjustment of coal and coke rates proposed by the Western railroads in the Western advance rate case were recently argued in the Interstate Commerce Commission's investigations. Large coal operators of Illinois, Indiana, Ohio, Oklahoma and other Middle Western states opposed the proposed rate increases.

Matherville—Officials of the Coal Valley Mining Co. recently closed down the Matherville mine, laying off between 150 and 200 miners. Unsatisfactory demand for coal has been given as the cause for this shutdown.

Taylorville—The deal for the sale of the Christian County Coal Co.'s mines to the Peabody Coal Co. will be completed in a few days, it is believed. The purchase price is said to be between $200,000 and $225,000.

Farmington—The new No. 8 mine of the Alden Coal Co. has established a new rate of production which the officials are striving to keep up. The output was recently doubled as compared with a month previous.

Danville—Through a petition of the Chicago Continental Bank and Trust Co., trustees of the Bering Coal Co., which became bankrupt several years ago, the sale of the latter firm's property has been ordered because of the inability of the coal company to pay a mortgage and other debts aggregating over six million dollars. Walter C. Lindley, of Danville, has been appointed special master, and the sale will be held at the Federal Building in Danville on May 12.

MINNESOTA

Duluth—John E. Lindgren, John Bergman and August Johnson recently incorporated the Red River Valley Coal Co. for the purpose of exploring and developing coal lands near Crookston, on which it is claimed large deposits of coal, believed to be of higher grade than any yet found in this part of the country have been discovered. These gentlemen have under option about 2000 acres of land and have sunk several test pits. A drill is being placed in operation to thoroughly explore the coal deposits.

ARKANSAS

Fort Smith—According to the report prepared by W. S. Newcomb, of the Southwestern Interstate Coal Mine Operators Association, the Arkansas coal production in 1914 was 299,980 tons less than in 1913. The entire production during the year was 1,643,881 tons as compared with 1,943,861 tons in 1913. Labor difficulties and the increased use of oil for steam purposes are said to be the causes of this falling off in production.

FOREIGN NEWS

London, England—A critical situation has arisen among the coal miners. Representatives of the Welsh miners have unanimously decided in favor of tendering a fortnight's notice of a proposed strike to the mine owners in order to enforce their demands for a 20 per cent. increase in wages. The Mineral Federation of Great Britain will meet shortly to decide what action they will take to compel the mine owners to accede to their demand for a similar increase. That the result of the trouble will be anything like a national strike of the miners is considered improbable, but it may necessitate Government intervention in a drastic manner.

PERSONALS

C. M. Weld, mining engineer, formerly at 66 Broadway, New York, has removed his office to 60 Broadway.

P. F. Sweeney, a leading mine worker of Shenandoah, Penn., has been appointed a board member of District No. 9 of the United Mine Workers of America.

J. H. Picton was recently offered and has accepted the position of mine manager for the Higbee Coal Co. at Peoria. Mr. Picton will assume his new duties on May 1.

H. McDermott, for the past five years auditor of the Pratt Consolidated Coal Co., has resigned his position to enter other business. His successor has not yet been named.

Richard Peters, Jr., has resigned his position as sales agent of the Producers Coke Co., of Uniontown, Penn., to become assistant to the general manager of the W. J. Rainey Co. with headquarters at 52 Vanderbilt Ave., New York.

Clarence Boyle, Jr., formerly district sales manager of the Taylor Wharton Iron & Steel Co., Connell Bldg., Scranton, Penn., has become associated with Clarence Boyle, Inc., wholesale lumber dealers, 1211 Lumber Exchange Bldg., Chicago.

S. E. Van Horn, formerly assistant engineer of the Delaware & Hudson Co., has been promoted to chief engineer of the coal department of that company, with headquarters at Scranton. Mr. Van Horn has been with the engineering force of the Delaware & Hudson Co.'s coal department for the past 15 years, prior to which he spent a number of years in the engineering department of the Lehigh Valley Coal Co. at Wilkes-Barre.

L. F. Hamilton, in charge of the advertising and specialty department of the National Tube Co., has just returned from an extended trip to the West and Pacific coast in connection with the company's exhibit at the Panama-Pacific Exposition. The National Tube Co.'s exhibit is a part of the U. S. Steel Corporation's exhibit which is located in the Mines and Metallurgy Building and occupies 44,000 sq.ft., being the largest single exhibit at the Exposition.

OBITUARY

Dr. T. C. Shaffer, surgeon for the Berwind White Coal Co., of Windber, Penn., was almost instantly killed in an automobile accident near Tyrone, Penn., recently. He attempted to avoid another car on the road, as the result of which he lost control of the steering wheel, and turned turtle into a ditch.

John H. Dougherty, one of the pioneer residents of Altoona, Penn., died recently at the home of his son, Clarence, in St. Louis, Mo., where he had gone on a visit. Mr. Dougherty was for many years engaged in business but lately had been developing a 900-acre coal tract at Dougherty, Penn. He was a veteran of the Civil War.

John Bryden, who died at Esquimalt, Vancouver Island, British Columbia, on Mar. 27, was a pioneer coal-mine manager in that province. He was born in Ayrshire, Scotland, on Dec. 4, 1831, so at the time of his death was in his 84th year. In 1862 he left Scotland for Vancouver Island, going by paddle-steamer to America, and via the Isthmus of Panama and San Francisco to Esquimalt and Nanaimo. At the latter place he at once became joint manager with Mark Bate for the Vancouver Coal & Land Co., an English company that had acquired the coal mine opened at Nanaimo about 1851 by the Hudson's Bay Co., which operated it for about 10 years. In 1880 Mr. Bryden transferred his services to the Wellington Colliery Co., a Dunsmuir incorporation that was operating within a few miles of Nanaimo. In 1894 he retired from active mine-management, but continued his association with the coal-mining business interests of the Dunsmuirs until the sale of their collieries to the Canadian Collieries Co. (Dunsmuir) Ltd. in 1911.

INDUSTRIAL NEWS

Columbus, Ohio—Judge Rogers in Common Pleas court has ordered the sale of the property of the Starr-Hocking Coal Co., of which C. E. Haskins has been receiver for several months. The properties consist of coal mines in the Hocking Valley.

Huntington, W. Va.—The Allis-Chalmers Mfg. Co. through the Banks Supply Co. has received a large order from the Lincoln Coal Mining Corporation for a generating plant to be erected on Big Creek. The Lincoln Mining Corporation has just recently put its mines into operation.

Toledo, Ohio—The steamer "W. H. Donner" left Toledo on Apr. 16 bound for Milwaukee with 10,000 tons of coal, this being the first shipment to leave Toledo this season. The steamer "Agassiz" began loading immediately after the "Donner" but was not expected to sail for several days.

Birmingham, Ala.—The annual meeting of the stockholders of the Sayre Mining & Manufacturing Co., which was due to be held this month, has been postponed until some time in May. It is expected that a complete reorganization of the company will take place at the annual meeting.

Coaldale, Penn.—Because the Eastern Pennsylvania Street Ry. allows workmen in mining clothes to ride on the regular trolley cars, despite protests, 37 girls, employed in Tamaqua mills and factories, on Apr. 16 engaged an automobile bus to take them to and from work. They assert that many more will follow their example.

Pittsburgh, Penn.—The first shipments of lake coal will go from the Pittsburgh mines to the Northwest about the end of this month. Mines throughout the Pittsburgh district have in the recent past increased production fully 10 per cent. Part of this was due to preparatory shipments to the Lake docks and the remainder to a generally better coal consumption.

Buffalo, N. Y.—The War Department has denied the Delaware, Lackawanna & Western R.R. the use of the North Pier for the mooring of coal vessels. Unless the matter is adjusted the company will be unable to load cargoes for Upper Lake delivery this season. Last year several hundred vessels were loaded there and the company has had the use of the pier for the past 50 years.

St. Louis, Mo.—In the case of the Dealers Fuel Co. versus the Burlington R.R., judgment was rendered for the plaintiff for $152 and costs. This is a case wherein the plaintiff notified the defendant to stop coal in transit, and the defendant ignored the order and delivered the coal to a bankrupt. This decides the right of a shipper to stoppage in transit, regardless of his reason.

Huntington, W. Va.—In compliance with orders recently published in bulletins posted by the Chesapeake & Ohio R.R. repair shop, 1700 men, skilled and unskilled, recently started working 9 hr. per day and 5 hr. on Saturday. This is an increase from 35 to 50 hr. per week. It is believed that the Lake coal movement having started, business will be heavy throughout the summer.

Lorain, Ohio—West Virginia coal is to be shipped to this point for the Lake trade, according to plans being perfected by W. T. Lechlider, superintendent of the Cleveland division of the Baltimore & Ohio R.R. The coal will be stored here and shipped as the demand develops. The Lake movement began formally, with the loading of the first cargo. It is expected to be a good season.

Spokane, Wash.—The sum of five million dollars, invested in Canadian coal fields by the Count Alvo Alvenselben, of Seattle, will likely be irretrievably lost because the count was unfortunate enough to interest Kaiser Wilhelm in his mining enterprise. The Count, too, is German, and since the war broke out, he has confined his business to this side of the line. He is the dominant figure in the Issaqua and Superior coal districts of Washington.

Fairmont, W. Va.—The Federal Coal & Coke Co. has let the contract to F. J. Foye, of Brownsville, Penn., for sinking a shaft near the confluence of Finche's and Heck's Runs. This shaft will be 360 ft. deep and will be sunk for the purpose of giving the mines better ventilation and to secure additional means of escape. Work on the shaft will be started on or about May 1 and will be pushed to completion as rapidly as possible. The cost will be about $30,000.

Birmingham, Ala.—Petitions for reduction in coal rates from Birmingham to Anniston and Selma were recently filed before the State Railroad Commission by the Chambers of Commerce of Anniston and Selma. They desire a restoration of the old coal rates which were granted to certain manufacturing companies. The rates apply to Talladega, Gadsden and Sylacauga. The granting of these rates was one of the issues in the gubernatorial campaign recently held.

Grafton, W. Va.—Officials of the Baltimore & Ohio R.R. are of the opinion that all employees of that road will be back at work within a few days. Announcement has been made that an additional appropriation has been received for the Monongah Division engine shops at Grafton for the remainder of this month, and that as a result from 50 to 60 men will be put back to work in the local shops immediately. It is believed that the shipments of coal will increase regularly up until about the middle of June.

Columbus, Ohio—The contracts for building 28 miles on the new line of the Chesapeake & Ohio R.R. from Portsmouth to Columbus, have been tentatively awarded by M. J. Caples, vice-president in charge of construction. The final contracts will be awarded some time during the coming week. The 28 miles extend from Sciotoville to Waverly. The tentative contracts were awarded to W. W. Boxley & Co., of Roanoke, Va.; Winston & Co., of Richmond, Va., and New York; Rinehart & Dennis Co., of Charlotteville, Va., and the Robert Green Contracting Co., of Pittsburgh. Work will be begun within 30 days after the final contracts are awarded.

Bluefield, W. Va.—It is believed that never in the history of the Pocahontas coal fields has the industry revived so quickly as it has within the past few weeks, rising from the lowest ebb in years at the end of February to virtually normal conditions by the close of March, and promising to rise above the highest record for any one month in April. The opinion that the coal business of April will exceed normal if not establish a record for the month, is based on the fact that a number of foreign vessels are loading at the Norfolk & Western piers, while the railroad company is said to be working to its full capacity to supply them.

Charleston, W. Va.—The list of fatal accidents in the coal mines of West Virginia during the month of March shows a total of 130 fatalities. This, however, includes 112 victims of the explosion at Leyland mine on Mar. 2. From all other causes, only 18 deaths were reported, which would denote a considerable decrease in mine fatalities but for this unfortunate disaster. This report shows 112 deaths as due to explosion, 9 as resulting from falls of roof and coal, 3 from electrocution, 3 from mine car accident, 2 from explosives, and one from miscellaneous. Four deaths occurred above ground. Of the total number of men killed, 45 were Americans, and 85 foreigners. By counties, the fatalities were as follows: Fayette, 115; Logan, 3; Harrison, 2; Marion, 2; McDowell, 2; Mercer, 2; Raleigh, 2; and one death each in Mingo and Preston Counties.

Coal Trade Reviews

General Review

Orders plentiful in anthracite. Improved undertone in bituminous but the situation is still decidedly mixed. Heavy export movement. Better outlook in the Lake trade.

While anthracite orders are not as plentiful as at the beginning of the month, it is none the less evident that some of the companies are being pushed hard to meet the demand and some orders will be carried through into May. The easing in the money situation has undoubtedly released numerous unexpected orders in all directions. The barge lines to Down East points already have sufficient business on their books to carry them well over into next month. Lake shipping is just starting, having been delayed by unusually heavy ice fields at the Buffalo ports.

Bituminous agencies are expressing every confidence in the intrinsic soundness of the market, but there are so many conflicting tendencies that the situation is decidedly mixed. On the whole the market has steadied up noticeably while there is a decidedly better feeling as regards prices, and no material concessions are noted, though the outlook for any substantial advance continues as indefinite as ever. It is still evident that large steam consumers are taking coal very conservatively, holding shippers rigidly to monthly proportions. Even the agencies handling the high-grade coals are still pressed with excessive tonnage, and buyers have not relaxed any in their disposition to be critical as regards quality. With the disruption in British shipping, our export trade continues to expand in a most impressive manner, particularly to South American ports; an easing tendency in ocean freights is having a stimulating effect on this business.

A further reaction appears to have developed in the Pittsburgh district market. This is commonly ascribed to surplus production at the local mines, but close observers are inclined to lay the blame on other districts where aggressive efforts are being made to force the market. Lake shipping is nominally open, but there is such a large quantity of coal offering, and production is so heavily curtailed that little relief is possible from this source, particularly as there is practically no movement so far. Preparations of the United States Steel Corporation to ship down a large tonnage of ore is creating a more hopeful outlook, and some few boats are already being loaded for the Northwest, but there is considerable coal standing at all of the loading ports, and the movement cannot be of large proportions until late in the season at best. The situation as regards dealers' stocks is rather mixed in Ohio, though further south the disposition to stock up is noted. Steam consumers still maintain they will be able to buy all their requirements in the prompt market and continue holding off on contracts.

The Middle Western situation is generally flat, but there is none the less a notable disposition to maintain prices and curtail shipments down close to market requirements. Contracting is still generally delayed and some of the largest consumers are apparently convinced that this will be a year of low prices. The outlook is none too favorable for even an average volume of business, and interest so far is concentrated on an effort to get profitable prices.

BUSINESS OPINIONS

Banks still surfeited with loanable funds but the general outlook is notably optimistic. Well sustained and conservative progress in most lines.

Financial Chronicle—There is little definite change to be noted in the general money situation. Thus far slight, if any, improvement appears evident in mercantile or industrial circles in the requirements for funds to be used in ordinary routine channels of business activities. The banks still are surfeited with supplies of loanable funds. Last Saturday's bank statement (the actual figures, as distinct from the averages) showed a decrease of the nominal sum of $43,100 in the surplus above requirements, the surplus itself standing at $148,214,940, which compares with $18,732,950 a year ago, when the old form of statement was in operation.

Armour & Co. (Credit Dept.)—Conditions have improved very materially during the last ten days. An increasing number of furnaces are in blast. Many factories are increasing their output. The number of idle men continues to decrease. For the first time in many months the number of idle cars shows a decrease. The demand for export is strong. Weather conditions uniformly are favorable. Conservative optimism of a healthy type is present throughout the United States, and in al' lines of trade, without exception, an improvement has occurred.

Dun's—Progress in trade continues, and the improvement, as a whole, is of gratifying proportions, but there is nothing in the commercial situation resembling the remarkable revival of activity on the Stock Exchange. This speculative movement, while having a somewhat stimulating effect upon business sentiment, as perhaps discounting the future, has no counterpart in actual industrial and merchandising conditions as they exist today. The fact is that financial recovery from the effects of the war is much more rapid than in trade, although the advance in the latter is also considerable.

Bradstreet's—Passing of the intense pessimism so long ruling, coupled with actual improvement in many lines, is the dominant element in this week's report. Improvement is reflected in brighter skies, better country roads, easier collections, favorable crop news, enlarged distributive trade, increased industrial operations, continued whittling down of idleness and intensive activity in stock market operations.

Boston News Bureau—While general trade, outside of the war orders, does not improve so fast as one would like to see, it is believed that the tide is turning and that the pace toward betterment will be quicker as the season advances. General business cannot be confined to a few special lines long. It will broaden naturally. Fundamental conditions are gaining strength all the time. However the situation abroad may shape up in the immediate future, our products will be wanted by Europe for a long time to come, and we are bound to gain foreign credit or gold. All we need to do is to keep strictly to our neutrality to hold our present commanding position.

American Wool and Cotton Reporter—The bulk of the business is on foreign wools, but largely owing to the scarcity of the domestic supply. The woolen goods market is awaiting developments. Wool fabrics are now selling for spring and summer wear, whereas they are seldom used except in cold weather. Orders for uniform fabrics have kept the mills busy.

Iron Age—The Pennsylvania R.R.'s announcement that it is about to buy or build 16,500 cars and 194 locomotives and the tentative placing in this country of further large sections of the Canadian Car & Foundry Co.'s $80,000,000 shrapnel contract have been the main contributions of the week to the news of better business. There is also the expectation that the Pennsylvania rail order will soon be distributed, adding 150,000 tons or more to the 20,000 tons already placed.

ATLANTIC SEABOARD

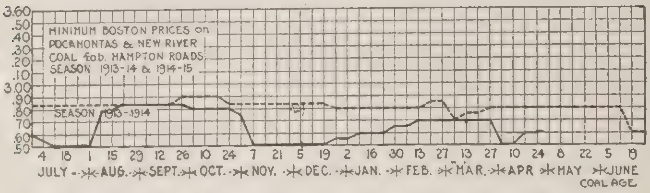
BOSTON

Better feeling noted with regard to prices on Pocahontas and New River but tonnage outlook not improved. Georges Creek shares in the general dullness. Pennsylvania grades being considered in new directions. Anthracite demand improves.

Bituminous—Pocahontas and New River continue fairly firm, considering the general situation. While there is more or less vacillation as to prices for future delivery, no material concessions are heard and apparently recent efforts to curtail production have been somewhat effective. There is a noticeably better feeling among the sales agencies with regard to prices although the prospects for any improvement in the near future are as hopeless as ever. There is little doing in the way of closing contracts. Buyers who are still waiting are likely now to defer purchases until June at least. Receipts here are well in excess of the demand and "market cargoes" are going hard. The mills this season are taking coal very conservatively; even those with ample storage are holding their contractors down to "monthly proportions." Several mill buyers who last year made contracts early are now buying only as needs require and are disposed to follow out that policy for months to come.

To show how New England buyers view the market, the recent action of the City of Boston authorities is a case in point. Bids were received Apr. 7 for supplying 41,000 tons to the harbor institutions, but they were rejected, and the city has now readvertised. There is no great amount of faith here in present prices holding through May and June.

The Georges Creek shippers are pressed with coal at all points, and there seems no improvement in demand. Their barges and steamers are moving on schedule, however, and if at times cargoes here are absorbed slowly, yet consignment is found and without any appreciable effect on the market.



The Pennsylvania coals are mulling along on small tonnages. A number of contracts have lately been closed, and in some few cases where West Virginia coals have usually been preferred in the past. The shippers are correspondingly encouraged over their prospects. All-rail trade is spasmodic, with prices averaging 5@10c. less on quantity orders than prevailed a year ago. One of the largest consumers in Boston is trying out different grades from Pennsylvania in the effort to make comparisons with Pocahontas and New River. Cambrias and Somersets that can show a uniform grade are receiving greater consideration here than usual.

Water Freights are unchanged. There are plenty of bottoms offering for what spot business there is and rates are easy at 80c., Hampton Roads to Boston.

Anthracite—The demand is noticeably better than early in the month. The weather has helped out the retailers, particularly to the Eastward, and orders that were not expected until later in the season have been coming in rather freely the past week. The prospect is that the shipping companies will carry over business into May that was unlooked for. Some of the shippers have had to disappoint Eastern consignees on the volume of April coal they could send forward.

Current quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.85@1.40	$1.15@1.60	$1.67@1.77	
Philadelphia*	2.10@2.65	2.40@2.85	2.92@3.02	
New York*	2.40@2.95	2.70@3.15	3.22@3.32	
Baltimore*	....	....	2.85@2.95	
Hampton Roads*	....	....	....	$2.60@2.75
Boston†	....	....	....	3.55@3.73
Providence†	....	....	....	3.55@3.73

* F.o.b. †On cars.

NEW YORK

Domestic grades of anthracite moving freely. Stove coal in strong demand. Bituminous slightly stronger. More contracts closed.

Bituminous—There appears to be a slightly healthier tone than prevailed a week ago and this in spite of the fact that mining has continued on a large scale. There is very little demurrage coal at the terminals, shipments being made to the piers only on orders as they are secured. The coming fall promises better conditions in the bituminous field especially if the international conflict is cleared up. The fear of labor troubles next year is another factor which calls forth the thought that a stimultaed market will become physically perceptible within the next few months.

With the loss of the enormous bunkerage business of the German lines some little consolation is obtained through the additional tonnage acquired from the increased neutral shipping. The harbor continues busy and these ships require much fuel although the total is far less than the 800,000 to 1,000,000 tons which were formerly taken each year by the great vessels of the German companies.

Some additional contracts have been closed up during the week although there are still some who delay. The figures are practically the same as those which prevailed a year ago. Quotations are: West Virginia steam, $2.35@2.55; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.05@3.10; Georges Creek, $3.15.

Anthracite—There has been a free movement of the various domestic sizes of anthracite during the past week although not the rushing demand which usually prevails in April. While there are orders for a large tonnage on the books of the retailers, some of this business is being pushed back a little and the dealers, in turn, are not taking the coal so fast as was anticipated a fortnight ago. The line trade keeps active with heavy shipments, and a large tonnage will be accounted for before the warm weather sets in. Now that Lake navigation is open there will soon be an urgent demand for Western shipment. A few minor contracts have been awarded within the past ten days at good prices which aggregate quite a tonnage.

In the local market stove coal is in strong demand. Chestnut is also moving more freely than before, while egg seems to be plentiful and orders are lighter. Pea coal and the smaller steam sizes are probably easier than a week ago owing to the steady continuance of mining and No. 2 buckwheat, which was short in the better grades, may now be loaded promptly. The wholesale trade is in a very satisfactory state, all things considered, and there is no doubt that there will be an increased impetus from now to the end of the month.

The anthracite market is now quotable on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$4.60	$4.60	$4.55	$4.55
Egg	4.85	4.85	4.80	4.80
Stove	4.85	4.85	4.80	4.80
Chestnut	5.10	5.10	5.05	5.05
Pea	3.55	3.35@3.55	3.50	3.15@3.50
Buckwheat	2.80	2.60@2.80	2.50@2.75	2.35@2.75
Rice	2.30	2.30@2.40	2.00@2.25	2.10@2.35
Barley	1.80	1.60@1.80	1.75	1.40@1.75

PHILADELPHIA

Market in anthracite shows no diminution in demand for domestic sizes. Steam sizes in easy supply, and output probably in excess of current requirements. No change in bituminous situation.

Anthracite—For the balance of the month the outlook indicates good business on the domestic sizes of anthracite. The demand still centers on egg, and while the requisitions for this size are hardly likely to warrant premium coal, at the same time, it is understood that both the companies and individuals are hard pushed for this particular size. Broken coal has shown a marked improvement the past week. Stove is in about the same condition as egg, although there does not seem to be such a sharp demand. Chestnut is still being absorbed and there is a brisk market for pea, but with production at the maximum, it is doubtful if the trade is taking all of it. Buckwheat and rice are already showing indications of the usual spring slump, occasioned by the closing down of furnaces for heating the large buildings. It is also understood that some of these sizes are going into stock.

Prices at Tidewater rule about as follows:

	Circular	Individuals
Broken	$4.25	$4.25@4.35
Egg	4.50	4.50
Stove	4.50	4.50
Chestnut	4.75	4.65@4.75

Bituminous—The situation in bituminous remains unchanged. Speculation as to the future has ceased, and the operators are concentrating their efforts on securing all the business they can at current prices. The demand is confined to contracts, and but little new business is offering. A revival of commercial activity seems to be slowly materializing, but the effect as yet on the bituminous trade is hardly noticeable. Prices for medium grades are still $1 to $1.05 with the better coals offering at 35 to 45c. higher.

BALTIMORE

Trade in the best condition for a long time. Demand improves and prices stiffen. Gas coals remain weak. New anthracite schedule in effect.

The present week opened with soft-coal trade in the best condition for weeks. There are reports of a better demand on both contract and spot business and contract prices have stiffened from five to ten cents a ton over the cuts on last year's prices as effective for several weeks previous; certain classes of spot coal are also advancing. The bituminous mining regions also report spot prices about five to ten cents better, although there is still no great demand for fuel. Producing interests are convinced that better times are at hand, and are holding more firmly to their product.

West Virginia gas coals have not responded to the upward tendency so far, but it is felt that there will be improvement shortly. Three-quarter gas is still selling around 75 and 80c. at the mines, while low-grade steam coals of West Virginia are bringing 80 to 85c.

Export movement continues heavy by reason of the fact that southern Europe and South America are cut off from the better grades of Welsh coal. The month of April seems likely to establish a new record for foreign movement from this port.

HAMPTON ROADS

Export shipments moving in large quantities. Prices firm and demand improving.

Large export cargoes have been loaded during the week. The coastwise movement has been principally to the New England ports the largest percentage going to Boston. The largest cargo of the week was taken by the U. S. Naval collier "Neptune" which loaded 10,515 tons of cargo and 1480 tons of bunker coal. The export coal has all been New River and Pocahontas run-of-mine, as usual, but there has been some nut and slack shipments to the New England market. From the number of cargoes going foreign it will be seen that the demand is increasing; while a majority of the ports are regular customers of Hampton Roads coals, others only purchase here when there is difficulty in getting the European product.

Steamers and schooners loading at Hampton Roads with export cargoes, week of Apr. 9 to 16 inclusive were as follows:

Norfolk

Vessel	Tons	Destination
Batinin Accame	6100	Catania
Ed. R. Smith	762	Horta, Azores

Note—Steamers are indicated by **bold face type**, all others being schooners.

OCEAN FREIGHTS

Market slightly easier and rates lower.

The freight market is slightly easier than a week ago, owing more to the decreased demand than to the increased supply of tonnage. Although a number of steamers were chartered for export coal during this period, the freight rates were but slightly lower than previous quotations.

To	Rate	To	Rate
Havana	$2.25@2.50	Guantanamo	$3.00@3.25

LAKE MARKETS

PITTSBURGH

Market more demoralized. Free coal at $1 for mine-run. Lake prospects poor. Mines operating 50%.

The coal market seems to have lost still more ground in the past week, and prices are lower than ever on free coal and possibly also on contract. While surplus production is given as one cause for the demoralized situation as to prices, Pittsburgh district operators are disposed to place most of the blame on other sections, making reference in particular to "wild cat" operations in West Virginia. There is a surplus of free coal in the Pittsburgh district but if there was any absorbing power in competitive markets the quantity would probably not appear large. Production, of course, might then be considerably increased. The Pittsburgh shippers certainly show a disposition to produce all the coal that can possibly be sold without actual loss.

Lake navigation is nominally open but practically there is hardly any coal moving and it does not seem likely there will be much of a movement before July. Manufacturing demand has increased slightly, but the domestic trade is down now to summer proportions and on the whole coal requirements are probably less than six weeks ago. Mines are operating at an average of about 50%, but many are idle or running only two days a week.

We quote contracts nominally on the basis of $1.15 for mine-run, but it is exceptional to obtain that figure even on contracts running to Apr. 1 next. Three-quarter coal for the Lake trade is now being sold occasionally and the price is only moderately well sustained at $1.15 to consumers and $1.10 to dealers. We reduce quotations on free coal, but still leave them at higher levels than have obtained on many recent sales: Slack, 75@80c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1@1.05; ¾-in., $1.10@1.15; 1¼-in., $1.20@1.25, per net ton at mine, Pittsburgh district.

BUFFALO

Industrial improvement is under way to a limited extent. Prices continue low and unsettled. Anthracite trade falling behind last year. Lake shipments delayed by ice.

Bituminous—The bituminous market is not making much headway and prices are unsettled, though no additional weakness has developed. Industrial business seems to be mending slowly, but it is still running substantially below normal. Some large war orders for steel have lately been placed with western New York plants and activity is promised for a number of months to come. Bituminous operators are now making Lake shipments in some instances and these may help strengthen the market, but there is a large quantity of coal offering at lower prices than would seem to afford a fair profit. Slack coal holds about steady.

Anthracite—The companies are not getting as many anthracite orders as at the beginning of the month, and it is predicted that the demand will not continue active as long as usual. Dealers are holding off in many localities and will either contract later in the month or wait until May. A fair proportion of them will take their chances of getting coal as needed after the coal-burning season starts in the fall.

The Lake shipments of anthracite have been held up by an unusually extensive field of ice. It is expected that the first shipments will be made during the present week.

TOLEDO

Navigation opened at Toledo. Considerable coal in the local yards.

Domestic coal is showing some stiffness in both demand and price. Steam coal is still slow. Generally speaking, however, conditions are about the same. Navigation was formerly opened on last Friday. The first vessel to leave Toledo was the "W. H. Donner," owned by the M. A. Hanna & Co.; it carried 10,000 tons of coal for Milwaukee. The "Agassiz" is now loading with 11,000 tons for the same port. It is reported that the Hocking Valley railroad has about 3000 cars of coal in the Toledo and Walbridge yards and Supt. Palmer states that about 150 cars of coal are being received daily.

COLUMBUS

Trade quiet in every department. Lake shipping slow in opening and steam business is also quiet.

Little demand is noted in domestic trade as the season is practically over. Dealers' stocks are somewhat larger than usual in some sections, while in other localities they are rather short. The tone of the trade is still good and future prospects appear to be brighter in the face of improved industrial conditions.

Steam business is still slow although something has been done toward renewing contracts. Quite a few of the steam consumers are expecting rather cheap fuel during the summer and are loath to contract at this time although some have signed up and the outlook is not so bad as formerly. Railroads are taking a considerable tonnage now. Some lines of manufacturing appear to be improving slowly and this means an increased demand for steam grades.

Lake trade shows a little activity. Some few boats will be loaded during the coming week for shipment at the opening of navigation but on the whole operators are holding off until later in the season. The large tonnage carried over on the docks of the Northwest is the principal cause for the slowness in opening. Chartering of vessels is not at all active. Lake prices will probably remain the same as last year.

Production in Ohio fields has been rather small during the week. In the Hocking Valley it is estimated that but 25% of the average has been produced. This is also true of Massillon, Cambridge, Crooksville and Jackson districts. In the Pomeroy Bend field the output has been about 45% of normal. Many mines have been closed entirely in all fields.

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.45	$1.50	.....
Inch and a quarter	1.30	1.35	$1.30
Three-quarter inch	1.25	1.30	1.25
Nut	1.15	1.25	1.15
Mine-run	1.05	1.10	1.05
Nut, pea and slack	0.70	0.75	0.65
Coarse slack	0.60	0.65	0.55

CLEVELAND

The trade is absorbing a larger tonnage, but the market is slightly lower than a week ago. Consignment coal a depressing feature.

Slack is selling at $1.65 to $1.70 on track here as compared with $1.70 to $1.75 a week ago. These are Monday prices and are likely to change toward the end of the week. The fine coal on track was mostly Middle district and Pennsylvania grades brought in over the Pan Handle. There was also some West Virginia No. 8 and Fairmont nut on track Monday, which sold for $1.80 to $1.85. Spot three-quarter coal brought $1.80 to $1.90. The lower price was paid for West Virginia No. 8 and the higher for Bergholz and high grade Middle district coals. Mine-run sold at $1.80 and a little 1¼-in. lump sold for $1.95 to $2. A good deal of coal was carried over Monday night.

Business is much better than at the opening of the year when the improvement started. There has been no let up in the increased business and while it is not up to what would be termed normal for a good year, it is becoming more general and is no longer confined to a few large companies.

Lake Trade—The Lake business does not show much life. The boats that are downbound will be on the market for coal the last of the current week or early next week and a number of them will have trouble getting coal cargoes. C. Reiss Coal Co. officials were in the city the week of Apr. 11 and arranged for the floating of 2,500,000 tons of coal to Sheboygan, Wis., Green Bay, Wis., Escanaba, Mich., and Duluth, Minn. The rate will be 30c., the same as last year. Most of the business is done on long-term contracts.

The outlook for Lake coal is better. Iron ore selling had not started last Monday, but the United States Steel Corporation is preparing to ship a large tonnage of ore, and the independent inquiry for ore is growing. Optimism is quite general.

Quotations on coal for shipment are:

	Pocahontas	Youghiogheny	Bergholz	Fairmont	W. Va. No. 8
Lump	$3.10	......	......	......	......
Lump, ¾ in.	......	2.20@2.25	2.00	$1.90@1.95	$1.90@2.00
Egg	3.10	......	......	......	......
Mine run	2.65@2.70	2.10	1.90	1.85@1.90	1.75@1.90
Slack	......	1.70@1.75	1.70@1.75	1.75@1.80	......

CINCINNATI

Improving industrial conditions have strengthened the nut and slack market. Beginning of the Lake movement has encouraged domestic production slightly.

While there has been no tangible change in the local situation during the past week, there is undoubtedly an improved feeling among manufacturers, as is evidenced by the continued strength of the screenings market. It is probable that the general industrial situation in this vicinity is better than for many months, making the prospects very good for summer business on the steam side of the market. If it develops that there is a normal market for the prepared grades the trade will have a first-class season. There is still some uncertainty on this score, however, as it seems to be extremely difficult to get accurate figures on the amount of domestic coal left over, either in this immediate section or at the Lake ports.

COKE

CONNELLSVILLE

Undertone continues to strengthen, with slightly more activity. Production and shipments make new record for this movement.

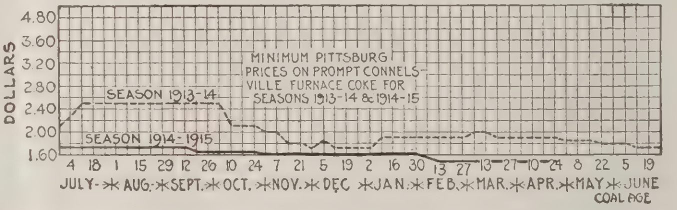
While there is not much activity, there is slightly more inquiry, and the whole tone of the coke market continues to strengthen in greater ratio than would be indicated by the new demand. Coke operators evidently have their eye on the steel trade, observing possibilities of further improvement and greater absorption of coke, even if it is only coke produced by the consumers. Such increased operations mean greater employment of labor, and there is not enough labor in the region, and probably not enough obtainable, to operate the district at capacity. It is said that a couple more merchant furnaces coming into the market and absorbing merchant coke would start prices definitely on the upgrade, and $3 coke is regarded as by no means an impossibility within a few months.

Prompt furnace coke continues to show a firm tone, and well above $1.55 has been paid for good brands. There is a little tentative inquiry for furnace. We quote: Prompt furnace, $1.55@1.60; contract furnace, to July 1, $1.60@1.65; contract furnace, Jan. 1, $1.75; prompt foundry, $2@2.35; contract foundry, $2.20@2.30, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Apr. 10 at 292,215 tons, an increase of 10,964 tons, and shipments at 287,829 tons, an increase of 9815 tons. Both production and shipments made new records on this movement.

Buffalo, N. Y.—The market shows little activity and prices remain about the same as for some weeks. Dealers report a notable hesitancy among consumers to enter into contracts. Prices remain unchanged at $4.25 for the best 72-hr. Connellsville foundry and $3.30 for stock coke.

Chicago—The coke market is fairly steady but it is reported that some consignment shipments have been sold this week at a sacrifice. There is an improved demand for furnace and foundry coke, but so far the domestic sizes have not shown the liveliness anticipated. Quotations are as follows: Byproduct, $4.45@4.65; Connellsville, $4.50@4.75; Wise County 72-hr. (select), $4.50; gas coke, $3.75@4; furnace, $4.45@4.65.



SOUTHERN

LOUISVILLE

Dealers coming into the market. Large shipment of river coal started from Pittsburgh.

Retail dealers are showing considerable disposition to begin stocking for next season's trade. Straight mine-run is now selling around $1, due in part to the fact that there is little movement of the block coals. Six-inch mine-run is on much the same basis. Block coals are offered at from $1.40 to $1.55, round at from $1.15 to $1.25 and nut and slack of the better grades, is up to 65 and 85c., due to the fact that it is scarce. All prices are f.o.b. mines.

Dispatch in this direction of fourteen barges of coal from Pittsburgh has been announced, the first shipment of the kind in many weeks, due to the low river stages. There is a very large quantity of coal in the Pittsburgh pools, according to reports here.

BIRMINGHAM

Steam fuels slightly improved. Lump coal very quiet.

The market on steam coal shows some improvement over last week, the demand being slightly stronger for the better grades, though conditions are far from normal, mines running only about two or three days per week. Lump coal shows no improvement, the demand being very light, and operators are making only what tonnage they are actually shipping. Prices are at least 50c. per ton lower than usual on lump coal.

MIDDLE WESTERN

CHICAGO

Light demand for Indiana coals though prices are well sustained. Franklin and Williamson County operators holding together firmly. Anthracite movement light.

The demand for steam coal from the Indiana mines is of little consequence, and it is reported less is moving at this time than a year ago. On the whole, Indiana operators are maintaining prices satisfactorily, even though the demand is light. No. 4 lump has sold at $1.35 and domestic sizes at around $1.40, with few shipments of the latter. Screenings show the same strength as last week.

Movement of coal from the Springfield district is quiet, but more contracting is being done by the operators there than elsewhere, particularly with the railroads. Contracts awarded so far are reported to be at the same figure as last year.

In Franklin and Williamson Counties the mines are averaging about three days per week. Coarse coals are in little demand but the Operators Association is maintaining stable prices.

Hockings are in the doldrums, and there is no business to be reported. The operators show no disposition to ship any free coal into this territory.

In smokeless coals there is little buying by retailers, but prices for direct shipment from the mines seem to be better maintained than heretofore. No free coal is reported on the market.

Anthracite trade is quiet and the movement so far well below last year. It is felt that the closing week of April will see a rush of orders to take final advantage of April storage prices.

Prevailing quotations are as follows:

	Williamson and Franklin Cos.	Springfield	Sullivan	Clinton	Carterville

ST. LOUIS

Domestic movement practically ceased and steam demand also flat. Outlook generally unfavorable.

There is very little activity in the local markets, with the possible exception that there is an effort to get better prices when there is no market. It is remarkable that with practically no domestic coal moving, there is not the demand for steam coal that had been anticipated. The result is that the market is in bad shape.

There is a little tonnage of Carterville and Franklin County coal moving into the country, but very little locally. The Standard market is at a standstill, excepting for the movement of railroad coal. A small tonnage of anthracite is moving in, but other than that there is very little doing.

Conditions are not at all favorable for even the average volume of business at this time of the year. Effective Apr. 12, a new scale of prices from the Standard fields went into effect, but the result will not be known until the surplus tonnage on hand has been consumed.

KANSAS CITY

Retail business about over for the season and wholesale very quiet.

The retail business here has come to a close and the wholesale trade continues without any change and with very little movement. Prices remain the same and show no indication of a change. Very little coal is being taken from the mines in Missouri and Kansas and thousands of miners are out of employment.

PRODUCTION AND TRANSPORTATION STATISTICS

IMPORTS AND EXPORTS

The following is a comparative statement of imports and exports of the United States for February, 1914-15, and for the eight months ending February, 1913-14-15, in long tons:

	Eight Months			February	
Imports from:	1913	1914	1915	1914	1915

FOREIGN MARKETS

GREAT BRITAIN

Domestic coals easier, but steam fuels still short. Prices continue to advance. Wage question more acute.

Apr. 9.—Business in the coal trade has been under the influence of the holidays during the greater part of the week, and although the miners as a rule loyally responded to the call of the Government to return to work as early as possible, the suspension of operations has naturally resulted in some further temporary restriction of the output and the supply available. There are no important changes in the position to note, however, the outstanding features being an easier tone in the house coal market and a very strong demand for practically every other class of fuel, accompanied by prices which show no sign of declining.—"The Iron and Coal Trade Review."

Apr. 9—There is great pressure for all descriptions, and coals are exceedingly scarce for this month's shipment. Quotations are approximately as follows:

Best Welsh steam......	Nominal	Best Monmouthshires...	$8.28@8.40
Best seconds...........	Nominal	Seconds..............	7.80@8.04
Seconds...............	$8.88@9.12	Best Cardiff smalls....	5.16@5.28
Best dry coals..........	8.88@9.12	Cargo smalls..	4.32@4.56

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Outward chartering is very quiet owing to the continued stemming difficulties. Tonnage does not offer freely. Rates are rather unstable but are approximately as follows:

Gibraltar.........	$3.84	Naples	$4.80	Las Palmas.	$3.60
Marseilles.........	5.02	Venic	9.60	St. Vincent.......	4.32
Algiers...........	3.86	Alexandria.......	6.60	Rio Janeiro.	6.72
Genoa............	4.80	Port Said........	6.48	Monte Video...	5.88
				River Plate..	6.12

Note—These quotations are based on an exchange rate of 24c. to one shilling.

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

For the official advertisements of bids wanted see the Contracts-to-Be-Let section on page 12.

+Indicates contracts regarding which official information has been received.

Recast

This section gives a synopsis of items previously announced that will come up for consideration during the ensuing week, together with the number of the page on which the former notice appeared; also additional or supplemental information, such as bids, etc., on other old contracts.

+No. 312—Chicago, Ill.—The City of Chicago is readvertising for bids on a portion of this contract (pp. 488, 666) for coal as follows: 1800 tons of screenings per month for delivery on cars at the 39th St. Pumping Station, 400 tons of screenings per month to be delivered in bins at the Lawrence Ave. Pumping Station. Bids must be accompanied by a certified check for $600 on the 39th St. business and for $200 on the Lawrence Ave. business. Bids will be received until noon, Apr. 29. Address Clk. John McGillen, Room 700, Karpen Bldg., 910 South Michigan Ave., Chicago, Ill.

No. 396—National Soldiers' Home, Virginia—The bids on this contract (p. 567) were opened on Apr. 16, but were so close and have required such extensive calculations of analysis, etc., that the name of the successful bidder has not yet been given out. Address Treas. S. E. Skinner, National Soldiers' Home, Virginia.

+No. 437—Boston, Mass.—The bids on this contract (p. 627), which provides for furnishing 2000 tons of anthracite and 1300 tons of bituminous coal to the local Post Office and Sub-Treasury Building, were: Anthracite screenings, Coleman Bros., $3.30; Wellington-Wild Coal Co., $3.36; Metropolitan Coal Co., $3.60; bituminous mine-run, Metropolitan Coal Co., $4.42; Staples Coal Co., $4.44. All quotations are per gross ton. Address Custodian William F. Murray, United States Post Office and Sub-Treasury, Boston, Mass.

+No. 454—Cleveland, Ohio—We are informed that this contract (p. 627), which provides for furnishing the Municipal Electric Light Department with 35,000 to 40,000 tons of Youghiogheny coal, was made for 18 months. Address Supt. of Service and Distribution C. G. Beckwith, Municipal Electric Light Department, Cleveland, Ohio.

No. 461—Boston, Mass.—The City of Boston has readvertised for bids on this contract (p. 627), which provides for furnishing 41,300 tons of bituminous coal to the institutions in Boston Harbor. All stipulations, specifications, etc., apply as previously announced with the exception that bids will be opened on Apr. 27. Address Supt. of Supplies D. Frank Doherty, Room 808, City Hall Annex, Boston, Mass.

+No. 489—Staples, Minn.—One bid has been submitted on this contract (p. 665) by the Dover Lumber Co., which offers to furnish Youghiogheny screenings at $2.65 per ton. Bids will be received until May 3. Address Supt. John Effinger, Municipal Electric Light Plant, Staples, Minn.

+No. 496—Malden, Mass.—In addition to the previous requirements noted on this contract (pp. 665, 707) we are advised that 700 tons of bituminous coal will also be required for delivery at the High School in the same manner as the anthracite. Address Clk. of Com. John L. Gilman, City Hall Bldg., Malden, Mass.

+No. 505—Louisville, Ky.—This contract (p. 665), which provides for the fuel requirements of the Finzer Tobacco Co., should read 225 tons of nut and slack coal per month instead of per year, as previously noted. Address Purchasing Agent, Finzer Tobacco Co., 4019 Finzer Ave., Louisville, Ky.

No. 506—Chicago, Ill.—We are informed that the tonnage involved in this contract amounts to 10,000 tons instead of 20,000 tons, as previously noted (p. 665). The purchaser has in the past been using southern Illinois screenings on this business. Address Purchasing Agent, Barrett Mfg. Co., 10 South La Salle St., Chicago, Ill.

No. 510—Chicago, Ill.—This contract (p. 665), which provides for furnishing approximately two cars per day to Darling & Co. at this place, has always been filled with southern Illinois 1½-in. screenings in the past. Address Purchasing Agent, Darling & Co., 4201 South Ashland Ave., Chicago, Ill.

+No. 511—Dayton, Ohio—Bids on this contract (p. 665), which provides for furnishing the National Military Home with coal during the next year, will not be opened until June 30 instead of May 1, as previously announced. Address Treas. W. H. Ortt, National Military Home, Dayton, Ohio.

No. 512—Chicago, Ill.—This contract (p. 666), which provides for furnishing approximately one car of Illinois screenings per day to the Barber Asphalt Paving Co., will come up for consideration shortly. Address Purchasing Agent, Barber Asphalt Paving Co., 7 South Dearborn St., Chicago, Ill.

No. 518—Chicago, Ill.—This contract (p. 666), which provides for furnishing approximately 30 cars of coal to the Bowman Dairy Co., is usually filled with 1½-in. southern Illinois screenings. Address Purchasing Agent, Bowman Dairy Co., 158 West Ontario St., Chicago, Ill.

+No. 522—Lorain, Ohio—The Board of Education has decided to readvertise for bids on this contract (p. 666), which provides for furnishing coal for the school year 1915-16. The new bids will be solicited on a heat-unit basis, and will be opened on May 12. Address Clk. E. Bruell, Board of Education, Lorain, Ohio.

+No. 527—San Francisco, Calif.—Bids on this contract (pp. 666, 708), which provides for furnishing coal to 28 Western army posts, will be received until 11 a.m., Apr. 30. Address H. S. Wallace, care Quartermaster Corps, "Chronicle" Bldg., San Francisco, Calif.

+No. 531—Frankfort, Conn.—Awards on this contract, which involves about 19,000 tons of coal for the State Prison Department, were scheduled to come up for action on Apr. 26. Address State Prison Commission, Frankfort, Ky.

+No. 540—Knoxville, Tenn.—Bids will be received on or before Apr. 24 for furnishing the Southern Ry. Co. with a large quantity of Alabama mine-run coal (p. 708). Address Fuel Agt. E. G. Goodwin, Southern Ry. Co., Knoxville, Tenn.

+No. 546—St. Joseph County, Ind.—The Board of Commissioners will receive sealed proposals until Apr. 26 for 600 tons of Pocahontas or New River smokeless coal, mine-run, 60% to be lump coal, to be delivered at the county jail (p. 708). Address Auditor Clarence Sedgwick, South Bend, Ind.

+No. 557—Brockton, Mass.—The quantities on this contract (p. 709) have been announced, and are as follows in gross tons: 528 tons of Lehigh egg, 600 tons of Lehigh stove, 1800 tons of Lehigh broken, 300 tons of Shamokin stove, 4700 tons of bituminous steam coal. Bids were received until 3 p.m., Apr. 20, and were submitted on a f.o.b. basis at specified yards at Brockton and Halifax, Mass. Address Highway Commission, City Hall, Brockton, Mass.

+No. 564—New Orleans, La.—Sealed proposals will be received for furnishing the United States Plant at South Pass, La., for its annual requirement of coal, until 11 a.m., May 3 (p. 708). Address Maj. Edward H. Schultz, Corps of Engineers, United States Engineer Office, Room 325, Custom House, New Orleans, La.

+No. 567—Brookline, Mass.—Sealed proposals will be received by the local city government until 3:50 p.m., Apr. 26, for furnishing approximately 2963 tons of anthracite coal and 2000 tons of bituminous (p. 709). Address Secy. of Board Edward A. McEttrick, Town Hall, Brookline, Mass.

+No. 568—Albany, N. Y.—Bids on this contract (p. 709), which provides for furnishing about 10,000 tons of anthracite and 3000 tons of bituminous coal for use at the Capitol Buildings were as follows:

Bidder	Anthra.[1]	Slack[2]	Grate[3]	Stove[4]
Willard M. Phillips	$3.68	$3.75	$5.54	$6.12
J. T. D. Blackburn	2.97	3.00	5.34	5.80
C. M. Stuart Coal Co.	2.97	3.12	...	...
R. B. Rock	3.20	3.40	5.00	5.75
E. W. Howell Co.	2.97	3.04	4.98	5.78
Montgomery Coal Co.	2.95	2.97	4.90	5.50
W. G. Morton	...	...	5.09	5.54

[1] 10,000 tons No. 1 buckwheat. [2] 2500 tons. [3] 600 tons. [4] 50 tons of stove or chestnut.

Address Supt. William H. Storrs, Capitol Bldg., Albany, N. Y.

New Business

No. 569—Louisville, Ky.—The Grocers Ice & Cold Storage Co., which consumes an average of 10 to 12 cars of nut and slack during the summer months, has no contract at present but would consider applications for furnishing coal on contract. Address Purchasing Agent, Grocers Ice & Cold Storage Co., 603 East Main St., Louisville, Ky.

No. 570—Louisville, Ky.—The American Elevator & Machine Co., which consumes about 300 tons of coal annually, is testing various grades to find one best suited to their purposes. Mine-run and nut and slack are being consumed at present. Address Pres. M. Poschinger, 520 East Main St., Louisville, Ky.

No. 571—Louisville, Ky.—The American Baking Co., one of the largest local consumers of coal, will arrange for a supply, probably a year's contract, some time next month. Pres. Budge, American Baking Co., South Tenth St., Louisville Ky.

+No. 572—New York, N. Y.—The United States Army will receive bids until 10 a.m., May 12, for furnishing approximately 5200 tons of bituminous and 900 tons of broken egg, stove and nut coal mixed, for deliveries at various points in New York and adjoining stations. Complete details can be had on application. Address Col. A. L. Smith, Depot Quartermaster, Army Building, Whitehall St., New York City.

+No. 573—Kokomo, Ind.—The local Board of Education will receive bids until 4 p.m., May 4, for furnishing approximately 800 tons of coal to the local school building during the ensuing year. Bidders are requested to submit quotations on both 2- and 3-in. screenings, Hocking Valley, Indiana No. 4, Virginia Splint and Pocahontas coal. The bids must all be accompanied by satisfactory bonds, and should cover cost of delivery to the various buildings. Address Secy. A. B. Armstrong, Board of School Trustees, Kokomo, Ind.

+No. 574—Cincinnati, Ohio—The Board of Education at this place will receive sealed proposals until noon, May 10, for supplying the various public schools with coal approximately as follows: 8000 tons of smokeless mine-run, 1600 tons of nut and slack coal, 2500 tons of lump, 50 tons of Piedmont smithing. All bids must be accompanied by a bond for 30% of the amount of the bid. Specifications are on file at the office of the chief engineer of the Board at 511 West Court St., Cincinnati. Address Business Mgr. C. W. Handman, Board of Education, Cincinnati, Ohio.

+No. 575—Middletown, Conn.—Sealed proposals will be received by the Connecticut Hospital for the Insane until 10 a.m., Apr. 26, for furnishing about 8000 tons of bituminous coal and 700 tons of anthracite. Complete details as to point of delivery, quality, etc., can be obtained on application. Address Asst. Supt. Dr. William E. Fisher, Connecticut Hospital for the Insane, Middletown, Conn.

No. 576—Chicago, Ill.—The Royal Enameling & Manufacturing Co. is in the market for mine-run coal under a contract to meet its steam requirements, involving about 7000 tons per annum. It has been consuming Knox County, Indiana, coal in the past. Address Pres. J. H. Fall, Jr., Royal Enameling & Manufacturing Co., 326 West Madison St., Chicago, Ill.

No. 577—Davenport, Iowa—The Davenport Water Co. expects to make a contract very shortly for its annual supply of coal; about 2000 tons of southern Illinois screenings are required. Address Davenport Water Co., Davenport, Iowa.

No. 578—Davenport, Iowa—The Independent Baking Co., which is just starting a new plant here, has not yet let any contract for its coal requirements. It has been using Harrisburg screenings and Harrisburg No. 1 nut for producer purposes. Address Secy. W. H. Wiese, Independent Baking Co., Davenport, Iowa.

No. 579—Mishawaka, Ind.—The Dodge Manufacturing Co. will be in the market about June 1 for its annual fuel requirements, aggregating about 9000 tons of mine-run coal. It has been using a West Virginia grade. Address Pur. Agt. F. P. Howlett, Dodge Manufacturing Co., Mishawaka, Ind.

No. 580—Union, N. J.—The local Board of Education will receive bids until 8 p.m., Apr. 28, for 100 tons of pea, 200 tons of nut and 300 tons of stove coal. Bidders should quote prices per net ton of 2000 lb. including cost of delivery and storage. Address Secy. Fred Cortal, Board of Education, Union, N. J.

+No. 581—York, Penn.—The School Board will receive bids until noon, Apr. 26, for furnishing approximately 1000 tons of anthracite and 1500 tons of bituminous coal to the local schools. Stove, egg, chestnut and buckwheat anthracite will be required, and Greensburg, Yatesboro and Scootac screened lump, Punxsutawney No. 3 screened and Dilltown smokeless mine-run bituminous coal also. Prices quoted should include cost of delivery to the various buildings. Address Secy. A. J. Updegraff, 229 West Third St., York, Penn.

+No. 582—Allentown, Penn.—Sealed proposals will be received by the city government until 9:30 a.m., Apr. 27, for furnishing coal as follows: City Garbage Crematory, 240 gross tons of mine-run gas coal; City Fire Engine Houses, 217 gross tons stove coal, 20 gross tons of chestnut and 20 tons of pea coal; Central Fire and Police Station, 30 gross tons of stove and the same of egg coal. All bids must be accompanied by certified checks and further information may be obtained by addressing the superintendent of the various departments noted. The bids will be received by Mayor Charles W. Rinn, 39 North Seventh St., Allentown, Penn.

+No. 583—Andover, Mass.—The local Board of Education is in the market for its annual requirements of coal and will receive bids until Apr. 30, 1915. Complete details can be had on application. Address Superintendent of Public Schools, Andover, Mass.

+No. 584—Ann Arbor, Mich.—The Purchasing Committee for the county at this place received bids until Apr. 22 for furnishing 125 tons of Lehigh Valley or Scranton anthracite grate, 75 tons of Lehigh Valley egg and 20 tons of the same, deliveries to be completed before Jan. 1, 1916. Address County Clk. George W. Beckwith, Ann Arbor, Mich.

+No. 585—Washington, D. C.—The United States Government will receive bids through the General Supply Committee until 2 p.m., May 6, for furnishing coal to the Executive Department and independent Government establishments in Washington during the fiscal year beginning July 1, as follows: BITUMINOUS (mine-run)—13,000 tons for the Bureau of Engraving and Printing, 2000 tons for the Treasury Building, 3200 tons for the Freedmen's Hospital, 7000 tons for the General Land Office, 20,000 tons for the Hospital for Insane, 5000 tons for the Agricultural Building, 3500 tons (2-in. bar screen; crushed, nut and slack) for the New Museum Building, 7300 tons for the United States Soldiers' Home, 2200 tons for the State, War and Navy Department Building, 7500 tons (crushed, nut and slack) for the Government Printing Office, approximately 4100 tons for delivery at various points in amounts not exceeding 700 tons. ANTHRACITE—3000 tons of buckwheat No. 1 for the Bureau of Standards, 2400 of the same for the State, War and Navy Department Building, 7500 tons of pea for the Government Printing Office, 6000 tons of pea for the Post Office Building, approximately 1600 tons for miscellaneous deliveries; 9010 tons of egg, stove, nut and furnace coal for delivery in small lots to the various buildings of the following departments: Treasury Department, War Department, Department of Justice, Navy Department, Department of Interior, Department of Agriculture, Department of Commerce, Office Public Buildings and Grounds, miscellaenous. Address Acting Secy. of the Treasury Byron R. Newton, General Supply Committee, Washington, D. C.

+No. 586—Utica, N. Y.—The Board of Contract and Supply at this place opened bids on Apr. 2 for coal to supply the Department of Public Works, Public Safety and the Department of Charity and the Parks, the bidders being the Utica Coal Co., Sang & Reussig, Emil George, Clark-Davis Co. and Henry F. Miller. Address Clerk of the Board of Contract and Supply, City Hall, Utica, N. Y.

+No. 587—Cohoes, N. Y.—The Board of Education at this place will contract in May or June for its annual requirements of coal, aggregating about 400 tons. Egg coal is used mostly, but some stove is also required. The cost for the coal on the expiring contract was about $6.25 per ton. The call for bids is advertised and the business let on a competitive basis. Address Board of Education, City Hall, Cohoes, N. Y.

+No. 588—Everett, Mass.—The Board of Education at this place will be in the market some time during May or June for its annual requirements of coal, aggregating 1800 to 2000 tons. The ash content must not exceed 14% and the price per ton in 1914 was $6.24. The call for bids is advertised. Address Committee on Fuel Supply, Board of Education, Everett, Mass.

+No. 589—West Hoboken, N. J.—The Board of Education of this place will receive bids until 8:30 p.m., May 27, for supplying the various schools with 1000 tons of stove and egg coal. Address Secy. Alexis Benoist, Board of Education, Hoboken, N. J.

+No. 590—Philadelphia, Penn.—Sealed proposals will be received until 1 p.m., May 18, for furnishing the Frankford Arsenal with coal as follows: 11,000 gross tons of best grade Clearfield, Berwind-White Scalp Level or other coal of equal value, deliveries to be at the rate of 300 tons per week during the winter and 200 tons per week during the summer; 90 tons of the best Lehigh stove coal; 100 tons of Connellsville coke, stove size. Bids will be received only from responsible dealers and quotations should be made delivered f.o.b. Frankford Arsenal, except on anthracite coal, which is to be delivered in bins on the arsenal grounds where required. Payment will be made on the price quoted with correction for variations in the heating value and ash. Complete details and specifications can be had on application. Address Commanding Officer, Frankford Arsenal, Philadelphia, Penn.

+No. 591—Troy, Ohio—The Public Service of this city will receive bids until noon, Apr. 27, for furnishing coal to the Water Works, Electric Plant and City Hall for the fiscal year beginning May 1, 1915. Mine-run coal and different grades of nut and slack are required, and bids should include cost of delivery in bins as required, but the cost of hauling from railroad cars should be quoted separately. All bids must be accompanied by a certified check for $100, and the successful bidder will be required to furnish a bond for $2000. Address Dir. of Pub. Service Henry J. Beck, City Hall, Troy, Ohio.

+No. 592—Nashville, Tenn.—The local Board of Education will be in the market during May or June for its annual requirements of coal, amounting to about 40,000 bu. of lump and 20,000 to 40,000 bu. of pea and slack. The current contract is being filled with Kentucky vein No. 9 coal at $2.10 per ton for lump and $1.60 per ton for pea and slack. The call for bids is advertised. Address Board of Education, Nashville, Tenn.

+No. 593—Boston, Mass.—The Supply Department of the City Government will receive bids until Apr. 29 for furnishing coal to the public buildings as follows: 7400 tons of broken, 7200 tons of egg, 3620 tons of stove, 900 tons of screenings and 9150 tons of bituminous. Bids will also be received at the same time for 350 tons of stove for delivery at Long Island, 150 tons of egg and stove each at Deer Island, 50 tons of stove and 150 tons of egg at Rainsford Island. Address Supt. D. Frank Doherty, 808 City Hall Annex, Boston, Mass.

No. 594—Mattoon, Ill.—The Central Illinois Public Service Co., whose general offices are at this place, is in the market for a contract covering its requirements, aggregating about 4000 tons, for delivery at about 20 different plants in Illinois; 1¼-in. and 3-in. screenings and mine-run coal are required. Address Pur. Agt. D. R. Truax, Central Illinois Public Service Co., Mattoon, Ill.

+No. 595—Hartford, Conn.—Bids were received until noon, Apr. 13, for furnishing the State Capitol with coal as follows: 700 tons of Lehigh egg (of not less than 12,900 B.t.u.) and 600 tons of Lehigh pea (of not less than 12,300 B.t.u.). Address Comptroller Morris C. Webster, State Capitol, Hartford, Conn.

Contracts Awarded

Note—Successful bidders are noted in **bold face** type.

No. 221—Columbus, Ohio—This contract (p. 446), which provides for furnishing the local Post Office with 700 tons of bituminous coal, has been awarded to the **Taylor-Williams Coal Co.** The contract provides for West Virginia mine-run coal at $2.24 per gross ton. Address Custodian S. A. Kinnear, United States Post Office, Columbus, Ohio.

+No. 262—St. Louis, Mo.—This contract (pp. 447, 664), which provides for furnishing and delivering 360 tons of bituminous coal to the Federal Building has been awarded to the **Boehmer Coal Co.**, at $2.36 per ton for 2-in. lump coal. Address Custodian Fountain Lorthwell, Federal Bldg., St. Louis, Mo.

+No. 290—East Orange, N. J.—This contract (p. 487) which provides for furnishing the local Board of Education with about 1800 gross tons of anthracite coal has been awarded as follows: **East Orange Coal & Supply Co.**, 1500 tons for delivery April to June; **David W. Ball Co.**, 300 tons for deliveries after August. Address Secy. Warren A. Clapp, Board of Education, East Orange, N. J.

+No. 340—Rochester, N. Y.—Awards on this contract (p. 528), which provides for the fuel requirements at the local public schools, were:

F. P. Weaver Coal Co.—Spring deliveries, anthracite egg and stove, $5.44; nut, $5.67. Winter deliveries, anthracite egg and stove, $5.82; nut, $6.05.

Jenkins & Macy Co.—Morris mine-run, $3.10; Morris lump, $3.30; Eureka Scalp Level, $3.40; semianthracite screenings, $2.35.

Yates Coal Co.—Indiana County, $3.10; Cambria County, $3.25; bituminous nut slack, $2.85.

D. M. Filkins & Son—Three-quarter lump, $3.25; anthracite buckwheat, July 1 to Oct. 1, $3.20; same, Oct. 1 to end of contract, $3.30.

Address Secy. J. S. Mullan, Board of Education, Municipal Bldg., Rochester, N. Y.

+No. 345—Salem, Ohio—This contract (p. 528), which provides for supplying coal to the local city water-works, has been awarded to **Reece Bros.** at $1.85 per ton of mine-run, delivered. The next lowest bidder was the Keystone Coal Co., of Cleveland, at $1.90 on cars at Salem. Adress Dir. of Pub. Service I. N. Russell, Salem, Ohio.

No. 346—Chicago, Ill.—This contract (p. 528), which provides for furnishing Sears, Roebuck & Co. with approximately 50,000 tons of steam coal, has been awarded to the **Ender Coal & Coke Co.**, of Chicago. The contract provides for 2-in. screenings, and it is understood that the coal will be shipped from the Livingston mine of the Rutledge & Taylor Coal Co. in Madison County, Ill. Address Pur. Agt. J. H. Westrish, Sears, Roebuck & Co., 925 Homan Ave., Chicago, Ill.

No. 353—Greenville, Mo.—This contract (p. 566), which provides for furnishing the Ozark Valley Ry. Co. with about 200 tons per month of 2-in. lump coal, has been awarded to the **West Virginia Coal Co.**, of St. Louis, at $1.25 per ton at the mines. Address Purchasing Agent, Ozark Valley Ry. Co., Greenville, Mo.

+No. 354—Janesville, Wis.—The Janesville Machine Co. advises that this contract (p. 566), which provides for about 2500 tons of coal, has been closed. No details are available. Address Pur. Agt. C. O. Eddy, Janesville Machine Co., Janesville, Wis.

+No. 357—Pottsville, Penn.—This contract (p. 566), which provides for furnishing 400 tons of stove coal and 3000 tons of buckwheat coal, has been awarded to **Edw. H. Borda**, Schuylkill Haven, Penn., at $1.83 for buckwheat and $4.48 for stove. The only other bid submitted was from Charles Heissler, buckwheat, $1.85, and stove, $4.40. Address County Controller J. E. Kantner, Pottsville, Penn.

+No. 369—Bridgeport, Conn.—This contract (p. 567), which provides for furnishing about 16,000 tons of bituminous coal, has been awarded to **Archibald McNeil & Sons Co.** at $3.95 per ton. Address Mgr. C. A. Paul, United Illuminating Co., Bridgeport, Conn.

+No. 377—Jersey City, N. J.—This contract (p. 567), which provides for furnishing the Municipal Building with coal until Mar. 31, 1916, has been awarded to **James Coyle.** The average price on the six grades involved was $5.80 per ton. Address City Clk. Michael I. Fagen, City Hall, Jersey City, N. J.

+No. 393—New York, N. Y.—This contract (p. 567), which provides for furnishing the Hastings Pavement Co. with from 6000 to 9000 gross tons of bituminous coal, has been awarded to the **A. W. Hillebrand Co.** The contract was awarded on a specification basis. Address Secy. C. P. Pultz, Hastings Pavement Co., 25 Broad St., New York, N. Y.

+No. 400—Eagle Grove, Iowa—The Citizens Light, Heat & Power Co. at this place advises that it has contracted for its requirements to Apr. 1, 1916 (p. 567). Address Secy. J. A. Innes, Citizens Light, Heat & Power Co., Eagle Grove, Iowa.

+No. 403—Bayonne, N. J.—This contract (p. 567), which provides for furnishing the local Board of Education with about 2500 tons of anthracite coal, was awarded to the **Consumers Coal & Ice Co.** at the following figures: Pea, $4.18; egg and stove, $5.80; chestnut, $6. Address Secy. of Bd. W. J. Tomlin, 26th St. and Ave. C, Bayonne, N. J.

+No. 433—Reading, Penn.—This contract (p. 626) which provides for furnishing about 2500 tons of pea, egg and stove coal has been awarded to **Elmer E. Moore & Bros.** on the following basis: Egg, $5.38; stove, $5.63; pea, $3.68. Fehn & O'Rourke bid $5.40 for egg; $5.65 for stove; $3.99 for pea. J. W. Holmes & Co. bid $5.60 for egg; $5.80 for stove, and $4 for pea coal. Address Secy. F. Roland, Jr., Board of School Directors, Reading, Penn.

+No. 455—Clinton, Mass.—This contract (p. 627), which provides for furnishing the requirements for the local School Department during the ensuing year, has been awarded to **Connery Bros.**, at $7.65 a ton for egg coal, and $7.45 a ton for broken. Address Frederick E. Clerk, Clinton School Committee, Clinton, Mass.

+No. 466—Reading, Penn.—Awards on this contract (p. 628) which provides for furnishing 400 tons of pea coal and 50 tons of stove coal to the Berks County Prison, were: **J. W. Holmes & Co.**, 400 tons of pea at $3.98; **H. J. Heck**, 50 tons of stove at $5.60. Other bids on this business were: J. W. Holmes & Co., 50 tons of stove at $5.74; H. J. Heck, 400 tons of pea at $4; Loy & Liebold, 400 tons of pea, $4, and 50 tons of stove, $5.65. Address County Controller D. K. Hoch, County Controller's Office, Reading, Penn.

+No. 467—Somerset, Penn.—This contract, which provides for furnishing the local water-works with coal during the next year, has been awarded to the **Economy Coal Co.**, at 6c. per bushel for mine-run coal. Address Supt. C. E. Pile, Town Council, Somerset, Penn.

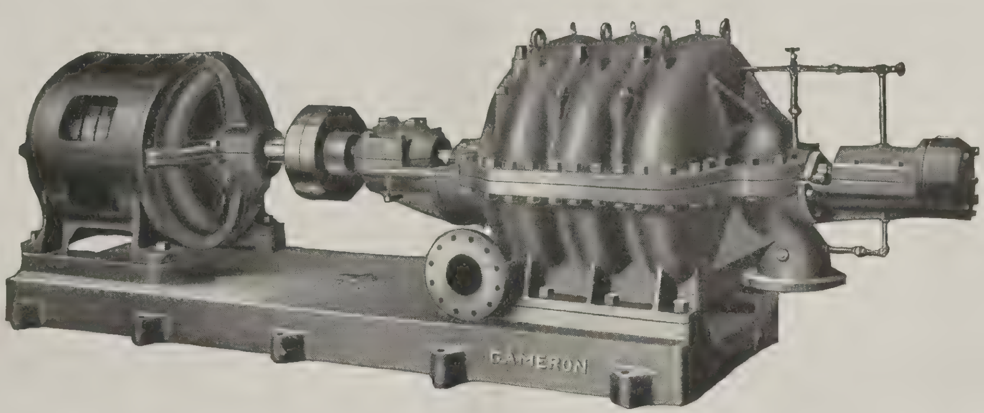
The Slogan of The Cameron—"Character: The Grandest Thing."

For High Efficiency Against High Heads



CAMERON CENTRIFUGALS

Five hundred feet down in the mine where there is a steadily increasing volume of water to pump out—there pump efficiency shows to the strongest advantage. In such situations CAMERON CENTRIFUGALS have proved their superiority.

The pump illustrated above is a 6″ four-stage centrifugal, delivering 1000 gallons a minute against 500 ft. head. The space occupied is only 3′ 6″ wide, 3′ 10″ high and 13 ft. long. In spite of the severe conditions it is giving very high efficiency.

Like the whole CAMERON CENTRIFUGAL Line, this pump embodies the latest and most correct principles of pump design. Simple in construction, compact and strong. One of its many operating economies is the easy accessibility to the working parts by merely removing the upper half of the split casing. This is a great advantage in the dark, cramped quarters down below. With these advantages there is combined the Cameron Quality of material and workmanship.

CAMERON CENTRIFUGALS are built in a great variety of types and sizes for low, medium and high heads. They may be direct-connected to an electric motor, or any available motive power. Our Engineering Dept. will gladly figure on your requirements without obligation.

Learn more about these pumps. Write for bulletins.

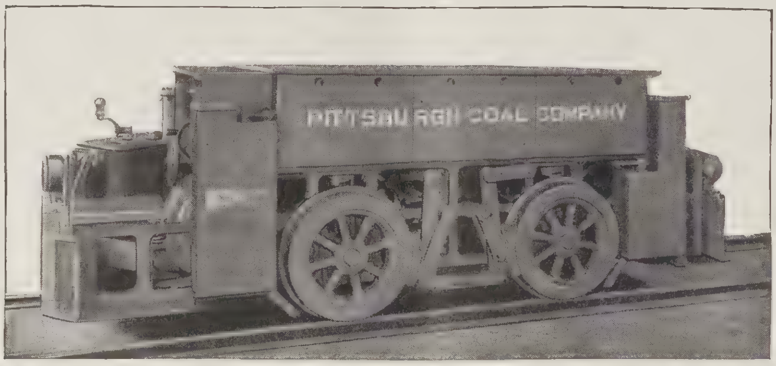
Why It Costs Less

to gather coal with

The Barsteel Storage Battery Mine Locomotive



It handles more cars on one charge—

Pulls less current from the battery—because it has

1. Five-point series-parallel control—Only two resistance points.
2. Low voltage battery motors—with highest efficiency.
3. Maximum drawbar pull—with minimum current.
4. No dead weight in frames.

Low Maintenance Cost—Secured by

1. Outside-hung motors—*accessible without removing battery.*
2. Open side frames—*Inside parts accessible without removing battery.*
3. Most rugged batteries made—*long life—minimum repairs.*
4. Spring-suspension of entire frame—*prevents jarring of battery.*
5. Best brake rigging—3 point suspension—Double brake shoe hangers—M. C. B. detachable Brake Shoes—Turnbuckle adjustment to keep full pressure on Brakes.
6. Barsteel frames—*Unbreakable.*

VOLUME 7 MAY 1, 1915 NUMBER 18

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

Foreword—Humanity and Good-Fellowship: *Page* 751

It is suggested that a mine superintendent, or any other coal-mine official, will profit personally and at the same time increase company efficiency, by giving ear to suggestions submitted by his employees. The mine boss who attempts to "go it alone" makes a serious mistake. COAL AGE, Vol. 7.

Ideas and Suggestions: *Pages* 752-753

Will the Worm Turn?—An Explosion Overcast—The Coal-Mine Clerk—Commissary Management.

*The Air-Lift Pump for Coal Mines: *Pages* 754-756

The principle of operation of the air lift has in the past been carefully shrouded in considerable mystery. The formulas used in calculating the amount of air required, as well as its pressure per gallon of water pumped under known conditions of lift and submergence, are here given. S. W. Symons. COAL AGE, Vol. 7.

German Coal in Sweden: *Page* 756

*Centrifugal Pumps in Coal Mines: *Pages* 757-760

The basic principle underlying the design and operation of volute and multistage pumps is here explained, as well as many constructional features which experience has shown to be important. W. A. Becker. COAL AGE, Vol. 7.

Extracts from a Superintendent's Diary: *Page* 760

English Trade Difficulties: *Page* 760

*A New Sinking Pump: *Pages* 761-762

The ordinary type of sinking pump is suspended in the shaft by a cable and must be raised whenever a shot is to be fired. This new pump works in a borehole beside the shaft, the power head being placed on the surface out of harm's way. Alden W. Baldwin. COAL AGE, Vol. 7.

*A New Portable Pump: *Page* 763

*High Efficiency in Mine-Pumping Machinery: *Page* 763

*Wood- and Lead-Lined Coal-Mine Station Pump: *Page* 764

*A New Type of Centrifugal Pump: *Pages* 764-765

RUN-OF-MINE TALKS
ON YOUR BUSINESS AND OURS

By the Business Manager

Six Letters from Indiana

D. B. MEDILL, General Superintendent of the J. K. Dering Coal Co., at Clinton, Ind., writes:

"I have been a subscriber to Coal Age for some time and am very much pleased with the paper. The advertising pages I consider well worth the attention of every active mining man and I personally follow them with interest."

* * *

H. M. STEWART, General Superintendent of the Grant Coal Mining Co., at Terre Haute, Ind., writes:

"I have been a reader of Coal Age for the past several years, and as Mine Manager and Purchasing Agent have been able to purchase various kinds of mine machinery and equipment through the advertisements in Coal Age. I consider it the best mining journal published."

* * *

EDWARD G. EPPLE, General Superintendent of the Queen Coal and Mining Co., at Jasonville, Ind., writes:

"During the past year I have purchased equipment from several concerns which were suggested to me by Coal Age advertisements. I may add that I consider your advertisements of as much value to me as your editorial work, and experience as an active Superintendent and Purchasing Agent has taught me the reliability of your advertisers."

C. W. SCHIMMELPFENNIG, Consulting Engineer of the Sunlight Coal Co., at Boonville, Ind., writes:

"We maintain our subscription to Coal Age principally because you provide us with a concise weekly list of mine equipment. It is necessary for us to keep in close touch with new equipment and we have found your paper the most suitable for that purpose."

* * *

J. H. NEEDHAMMER, Superintendent of Mine No. 2, Jackson Hill Coal Co., at Sullivan, Ind., writes:

"Your advertising pages have kept me in close touch with the new equipment, and I have frequently recommended the purchase of supplies and equipment advertised in Coal Age. Past experience has taught me the reliability of Coal Age advertisers, and when I recommend the purchase of supplies advertised in your paper, I do so without misgiving, and am willing to assume responsibility for the order."

* * *

GEORGE EPPERSON, President of the Valley Coal Co., at Terre Haute, Ind., writes:

"Coal Age has given me many valuable suggestions, which I have been able to make practical use of, and the advertising columns, which I follow with great interest, continually suggest new equipment which will benefit our mines."

Engineering Talks to Operators

Selecting the Plant Equipment

THERE may be several ways home, but there is only one *shortest* way. There may be several ways to do a thing, but there is only one *best* way. This evident truth applies to nothing more directly and more vitally than to the business of mining coal.

It is possible to spend $100,000 in opening and equipping a mine to produce 1000 tons a day; or it is possible to invest double this amount without adding materially to the daily output capacity. The entire difference has to do with the wisdom exercised in the purchase of the plant equipment, it being understood that physical conditions in the two cases are the same.

This is the age of the specialist, which fact applies to everyone in every industry, from office boy to president. A man can hardly expect to master all the intricacies of finance, or to understand in minute detail the commercial phases of a great business, and yet be entirely familiar with the practical operation of a plant, the successful working of which depends wholly on engineering skill.

Innumerable failures in coal mining have resulted from defective initial plans. Oftentimes men who are able executives and efficient in their own line of endeavor have met with great trouble through their failure to recognize that the engineering and the executive, or business side of mining, are totally different. Success can only come from a full recognition that expert advice, based on long experience in the operating end, is essential to safety and efficiency in coal production.

There is but one sane method to follow in purchasing mine equipment, and that is to prepare careful plans and specifications to cover the exact article, or articles wanted. And this is but half the job; the other half is to see that the equipment furnished is precisely what was ordered. Far from being displeased, the manufacturer of mining equipment will be glad to have definite facts, or data, to use in building the machine that is wanted. The mine manager who simply sends out a letter, stating in a general way his requirements and then asking for plans and estimates, is following a line of action that is unworthy and unsatisfactory.

The average business man knows more about commercial law than he does about electricity, yet he would not consider consummating any deal or contract of any importance without the services of a lawyer. The average mine operator knows more about civil engineering than he does about electrical engineering, yet he employs a civil or mining engineer to make plans and maps of his mine.

One certain result following the submission of indefinite equipment requirements to a manufacturer is the call of a salesman; in fact, if several machinery people have been communicated with, the outcome will be a number of salesmen each presenting to the mining company strong reasons for the purchase of their particular machine. When a large percentage of the bids received are from high grade manufacturers it often becomes a difficult matter for the mining company to reach a decision which ultimately leads to the best economy. In many cases an apparently prudent decision proves to be the direct converse when the machine is placed in operation, whereupon the mining company is dissatisfied and the manufacturer severely criticised.

The one solution of the entire matter is effective cooperation between the mining company through properly employed engineering skill, and the equipment manufacturers. The latter are prepared in most cases to build exactly what is wanted, if the would-be purchaser will state exactly and in detail just what is desired.

We would be pleased to discuss your prospective plans and extensions in detail.

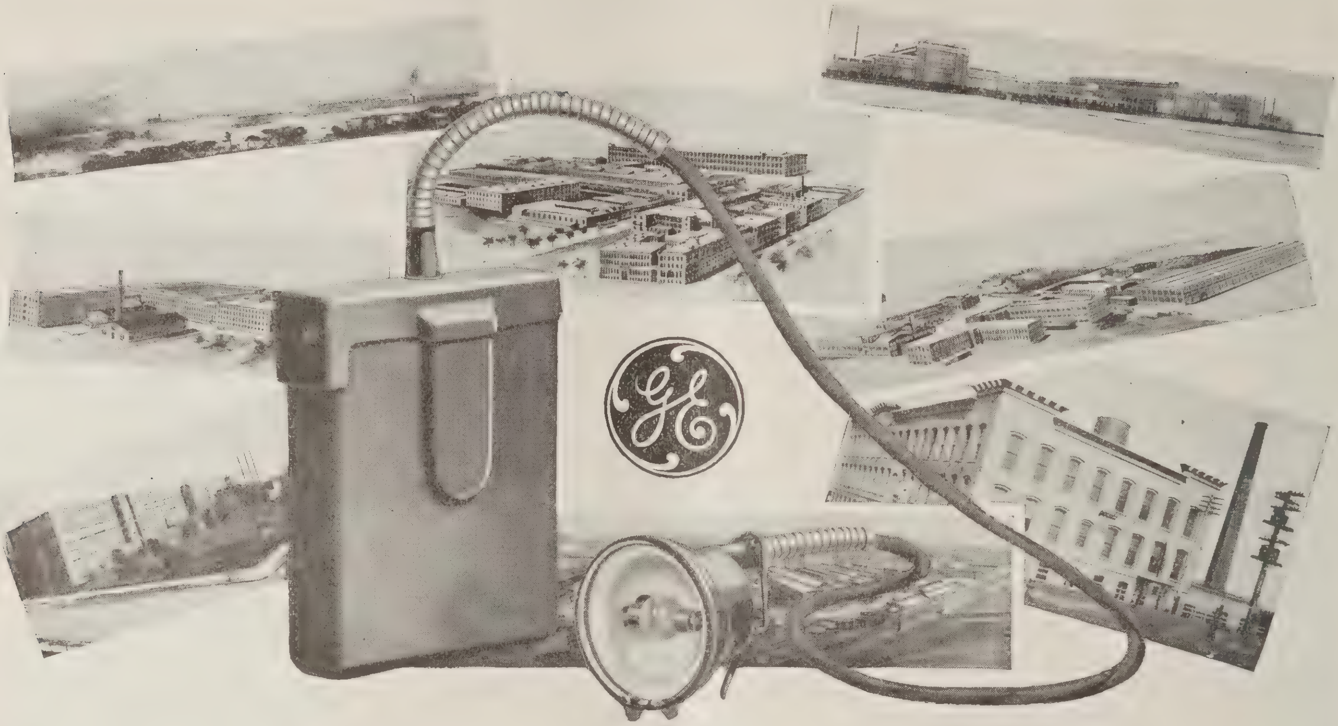
Consulting Electrical Engineers



The G-E Miners' Lamp is backed by the G-E Organization

The G-E organization of engineers, skilled workmen and commercial executives is vitally interested in each and every product put out by the General Electric Company. Every piece of apparatus, every device, however large or small, must measure up to G-E standards or it cannot win the approval of the organization and without that approval it cannot be put upon the market.

The G-E Miners' Lamp bears the stamp of G-E approval and hence is backed by the G-E organization, which insures reliability in the product and satisfaction on the part of the purchaser.

COAL AGE

Vol. 7 NEW YORK, MAY 1, 1915 No. 18

Humanity and Good Fellowship

As a usual thing there is a considerable difference in the point of view of the man at the face and the mine superintendent. The latter's conception of mining details should be much clearer than the coal digger's.

However, the most successful mine executives are those who do not refuse to listen to their employees' suggestions.

"The company pays ME *(!) to run this mine, and I don't want any of you fellows to butt in."*

We know of a superintendent (now digging coal) who, when any of his men suggested some real improvement, would invariably reply: "The company pays ME (!) to run this mine, and I don't want any of you fellows to butt in."

However, when a new idea from one of the men did get to him, he would apply the suggestion to the operation of his mine, and when the manager next came around he would point to the improvement and ask—"What do you think of my new plan?"

So successfully did he work this game that he held his position with the company for several years, but "murder will out," and eventually the general manager got wise to his tactics and a new superintendent was put in charge. It is needless to say that few of the miners expressed regret.

We know another superintendent—his name is Jim. He encourages his men to suggest any improvement that they think will benefit the working of the mine. He is considerate and always ready to listen when Tom, Dick or Harry tells how little Bob is getting along at school.

If the men at the mine have a grievance, they can always count on Jim's willingness to listen to their story.

As a result of his just and generous administration, a bond of sympathy and friendship grew up between Jim and his miners, so that recently when he was promoted to general manager all the men serving under him got together and presented to him a handsome token of their deep appreciation.

The superintendent that does not possess a kindred feeling toward his fellow-mortals will never be permanently successful. When any man in a position of authority becomes an autocrat, he has failed to realize or at least to observe the old truth, "There is so much good in the worst of us." He has failed to grasp the spirit of co-operation as applied to production.

Let us get rid of our aloofness and settle down on the bed-rock of common-fellowship. Let us eliminate coldness, and in its stead feel that we all belong to one great society.

Why attempt to "go it alone" when a hundred hands are ready to help if only the opportunity is afforded them.

Suggested by William Crooks, Ensley, Ala.

Ideas and Suggestions

Will the Worm Turn?

By R. Z. Virgin*

During the past few years mine superintendents have been seriously studying the construction and makeup of mine cars. Among other things this question is often asked by the man whose money is invested or expected to be invested: How does it occur that cars in olden times cost less than one-half the present cost and were about one-half as light, and the mine produced about the same amount of coal?

I believe the investor has the right to ask such a question. A few years ago the average car built for 2-ton capacity weighed about 1800 lb. and cost about $20.

There are numerous firms of car builders each striving to outdo the other and each expecting his cars to run easier, longer, faster and to stand up better than any other company's product. So each firm takes out certain patents, and every time a patent is granted the coal companies are charged "so much" per car extra for these "improvements" until such prices are asked for cars and car irons that mining-men are studying the construction of the cars made in former days.

The standard mine-car wheel used to weigh about 90 lb.; now it weighs 140 lb. To this latter weight must be added channel bars weighing 35 lb. each and extra boxings or bearings weighing a total of 40 lb. Two straps used to be sufficient on the end gate; now it takes four straps, and double ones at that; and in addition a plate of iron $\frac{3}{16}$ in. thick is added to the door, the makers say "to strengthen it."

Irons all over the car have doubled in thickness and width, until the once 1800-lb. car now weighs (with the improvements) from 2800 to 3500 lb., and the cost of such rolling stock has increased at the rate of almost 100 per cent. Is there a good reason for it? They haven't reduced the costs of hauling nor bettered the product.

Is the Increased Cost Warranted?

No corporation or individual is in business for pleasure; so what warrants this additional outlay of money and also dead weight carried?

Large cars, with modern improvements, are large investments; the improvements require high-priced labor to make repairs, also high supervision costs. Will they save their cost and show a profit after their upkeep and the interest on the investment are considered?

I have in mind a colliery having 450 cars, each carrying 700 lb. of "improvements," which is 315,000 lb. in all. Each car makes two round trips per day, which causes the company to haul 315,000 × 2 = 630,000 lb. of "improvements" 5 miles per day. Figuring 300 days per year, the coal company is carrying a load of 189,000,000 lb. of "improvements" per year. It is not the first cost that counts, but the continual outlay for power, etc., to keep these "improvements" moving.

The price of coal has gone down; the price of mine cars has gone up. At the mine already referred to, when the wire cable breaks the cars run down an incline and are wrecked, being almost a total loss. If the most expensive cars would survive just two such accidents, they would be equal to the light cars; if they would stand three such accidents, they would be superior; but they all have been a total loss after the first wreck.

Heavy dead-weight cars require heavy locomotives to haul them. This in turn requires heavy rails, and then heavier ties, and then larger spikes. Furthermore the heavier cars and larger ties require higher and wider haulways, and the roof must be blasted, causing an increased outlay for yardage costs. Is the game worth the candle?

Are Such Heavy Installations Justified?

During the past few years cars have become so large that companies are placing capacities, light weights and numbers with the firm's name on the sides, and they are now holding 4 tons, or 8000 lb., together with a car weight of 3500 lb., making 11,500 lb. in all. Totaled up this gives a gross load of about 7 tons. Can you imagine what size rails and ties it will take in the rooms and pillars to accommodate these cars? Can you imagine men in rooms handling rails 35 to 45 lb. per yard? Can you imagine this size rail going around the room necks into each room? I very much doubt the wisdom of such an installation.

During this steady increase of weight in the cars, did the coal loader share in the benefits, if there were any? Did he get any more pay for pushing the cars? We boast of not having a mule in the mine. Is it a credit to the firm? This latter thought has not been given the consideration it ought to have, and the worm may soon turn.

⁂

An Explosion Overcast

By Ralph W. Mayer*

The Roslyn-Cascade Co., William McKay, manager, uses at its No. 2 mine, of which James Ash is mine foreman, a light, substantial and inexpensive overcast, which can be quickly replaced if it should happen to be blown out.

The stoppings or walls across the air-course and parallel to the entry are built of concrete or 8x8-in. timbers, squared as high as the roof of the entry. They are set in hitches cut into the ribs and sealed with cement grout. If timbers are used, they are fastened together with drift-bolts and banked up with waste to strengthen the walls. On top of these walls light steel rails are laid, one end on each wall and reaching across the entry. Three or four feet apart is as close as it is necessary to lay the rails, having one on each side of the overcast to support the walls that reach from the overcast floor to the side or top of the excavation made for the passage of the air.

---

*Superintendent West Virginia-Pittsburg Coal Co., Colliers, W. Va.

*Roslyn, Wash.

These rails have two fishplates bolted to each end, which are given a half twist and bent at a right-angle, so that they reach down over the side of the wall or stopping, to which they are fastened with spikes or small drift-bolts, holding them securely in position.

Across these rails and parallel with the entry are laid sheets of 1/8-in. iron or steel, having the same length as the width of the overcast. These sheets are given a lap of three or four inches on their edges and are fastened together with bolts placed a foot or so apart, but are not fastened to the steel rails at all. An explosion would simply raise them off the rails, leaving the rails and stoppings or walls of the overcast uninjured, and the overcast could easily be repaired.

The side walls of the overcast over the entry can be built either of concrete or wood on top of the sheet steel, or a couple of extra rails can be laid across the entry on the sides of the overcast and used to build the walls on, leaving the sheet steel free. A rope grease or some rust preventive is spread over the steel on the floor of the overcast to prevent its rusting.

A 2-in. plank is laid over the overcast above one of the rails to walk upon and to keep the sheets of steel from being sprung. A couple of fishplates bent at right-angles are spiked to each end of the plank and to the side of the wall upon which the rails rest, so that the plank is always in position.

⁂

The Coal Mine Clerk

By Neill Hutchings*

Several thousand clerks are engaged in doing the clerical work for the coal-mining companies of America.

Most of them have been told that clerks cannot be classified as to work and fitness like men in the operating end of the business. They say the work of a clerk is of an intangible nature and difficult to measure; also that these men are nonproducers. The fellows who work as mine captains, foremen, superintendents, etc., are in the producing end. They can smash records. The clerk can't, they say.

Without doubt there are thousands of clerks, storekeepers, timekeepers, shippers, weighers, bookkeepers and so on who believe they haven't got a chance to break records. Only too often the clerk lets himself believe his only chance for promotion is for the man ahead of him to die or move on. His pay is not what he wishes it was. In many cases this is due to the fact that he allows himself to believe he can't help it.

Because somebody told him that classifying clerks was an impossible thing, he was so deluded as to believe it. When Mme. Schumann-Heink, the great singer, started her career, a noted musician told her to quit trying to sing and go back to sewing. She would not listen to such advice nor believe that she could not sing. Now she can sing anywhere on earth and name her own figure.

Clerical Force Is a Factor in Success of a Business

The clerical force of the accounting organization of any coal concern is as great a single factor in the success of the business as the operating department. As for the individual clerk, he can break records and do things worth while just as well as any man in the company from president down. The trouble with some men is, they want to measure anything they do with whatever things a bigger man may do and are unable to see that *doing things* is what counts rather than the magnitude of what is done.

It used to be true in some concerns that a clerk was looked upon as a "person," while the man who was an official of whatever title in the operating end was looked upon as a "personality." We know better now. We have long ago learned that power and worth are the measure of "personality." A clerk may be a personality just as easily as any other man. If he wants to achieve personality, here are three rules for him to follow:

First, he must get away from tradition and believe he can perform things as well as any other man. Break a record by smashing tradition.

Second, remember that time is his greatest asset and quit wasting it. Then concentrate and make up his mind to do more on his job and do it better than anyone else ever did. No concern can overlook such a clerk as he will be if he does this.

Third, he must really want to be more than a clerk. Then as soon as he knows what he wants to be in his business, he must take some of the time he now wastes and use half an hour or an hour each day to study his work, enrich his mind and obtain the accurate knowledge necessary to success.

If he will give only 30 minutes a day to the study of some splendid idea as against wasting that much of his time, he cannot miss achieving success for himself and his concern.

The clerk who would succeed must invest as many moments and hours as he can in learning to be worth more to his concern. He must quit thinking that either himself or his ability is unclassified. It is just as true of the clerk as of any man in the concern from president down that he is paid what he is worth.

Good clerks are not common. Unfortunately for companies who need them, they are rare. For him, it is fortunate that this is true; that is, if he really wants to prove his worth. He has as much chance as any other man alive today.

---

*Birmingham, Ala.

⁂

Commissary Management

In order to counteract the losses due to carelessness, dishonesty and incompetence, it is always advisable to make inventories of commissary stocks on the basis of selling price. After making an inventory of this kind, mark with the selling price all stock purchased thereafter. At the end of any merchandising period, preferably not over four or six months, take another inventory, also at selling price. The amount thus inventoried should be deducted from the total of the former inventory, to which has been added the total price for goods purchased in the interim. This should agree with the book record of gross sales after making due allowance for unavoidable inaccuracy in weights and measures. The value of the goods spoiled during the period and the difference in the price of goods which are marked down should be added to this allowance.

The first year this plan was put in operation at a commissary store in the Middle West the increased profit on sales was 6 per cent., in the second year 10 per cent. and in the third to the fifth year from 9 to 11 per cent.

The Air-Lift Pump for Coal Mines

By S. W. Symons*

SYNOPSIS—The principle of operation of the air lift has in the past been carefully shrouded in considerable mystery. The formulas used in calculating the amount of air required as well as its pressure per gallon of water pumped under known conditions of lift and submergence are here given.

The air-lift pump has found its chief field in municipal and private water-supply, and there are many large coal mines using it for such purposes. It has not been used extensively for shaft unwatering and mine drainage, although it is better adapted to such work under certain conditions than any other method of pumping.

Of the many air-lift plants in operation, some are working at a better economy than would be possible with other methods of pumping. As the matter of cost of operation is one that can be determined only after knowing all the working conditions of a given case, economy is often by no means the governing consideration; sometimes reliability and simplicity are of even greater importance, and it is in such cases that the air-lift method excels.

For shaft unwatering, the ease and cheapness of installation, absence of moving parts under water, ability to handle acidulous and foul water and the high rate of discharge from a given size of pipe are obvious advantages peculiar to the air lift.

For mine-drainage work, the great simplicity of the system, the fact that any number of pumps can be operated from one compressor plant and the absence of complicated mechanism in restricted situations underground are its chief recommendations.

A special case of mine drainage where the air lift can be used to great advantage is when water is struck at a low level a long distance from the main pump or shaft—sometimes a matter of a mile or more. Instead of laying long and expensive pipe lines, it is often both cheaper and more satisfactory to install an air lift by putting in a bore-hole from the surface to pass through the workings at or near the low point. With a properly designed air-lift pump it is easy to see that the efficiency of such an arrangement would be considerably greater than the forcing of the water through several hundred feet of pipe to the shaft. Fig. 1 shows the arrangement clearly.

Just such a case was that of the Clinton Coal Co., of Clinton, Ind., described briefly in the Jan. 17, 1914, issue of Coal Age. In this instance water had broken into the mine about 4000 ft. from the shaft at a spot 160 ft. from the surface. It was not until after two lines of 3-in. pipe had been laid and proved inadequate that resort was had to the air lift. The lift was kept in operation 24 hr. a day for four months before the water was sufficiently reduced to resume mining, and it is of course still in operation a small part of the time.

When it is not feasible to carry the bore-hole below the level of the workings (which is necessary with the usual type of air lift in order to provide "submergence"), a pump can be installed in the manner described in Coal Age of Apr. 4, 1914. This is known as the Jones system of compressed-air pumping and consists of a direct-acting pump operated by compressed air working in conjunction with an air lift. The direct-acting pump discharges both air and water into a closed tank, from which the exhaust air expels the water through an ordinary air-lift pump. The function of the direct-acting pump is to put a "head" on the water equivalent to that obtained by the submergence which would be necessary for a standard air-lift pump.

Before enumerating the features which appeal to the practical mine operator it might be well to outline the general principle of the air lift.

Operating Principle of thp Air Lift

Thirteen years ago Dr. Julius G. Pohlé first proposed, in a commercial way, that the most scientific method of inducing water inside a pipe to rise higher than the water outside the same pipe was to reduce the weight, or specific gravity, of the column of water within the pipe, when the greater relative weight of the water outside would act to force the lighter column upward. The simplest method of lightening the column of water in the pipe is to mix air with it. This mixing of air and water is what the so-called air lift does, and it is practically all that it does, while gravity does the rest.

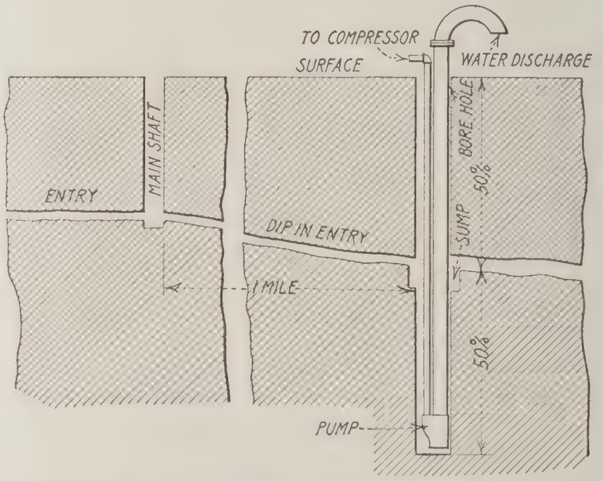

Fig. 1. Showing How Mine Workings May Be Drained by Air Lift

Notwithstanding the length of time during which the air-lift system has been in commercial use and the thousands of plants in successful operation, it is still considered more or less fashionable to make a mystery of its operation. This condition has been fostered to a great extent by the number of variable factors entering into the proposition, making it difficult to derive practical working formulas; also by the fact that manufacturers making a specialty of selling and installing these systems have obtained their data and experience at considerable expense and have consequently been unwilling to divulge to the public the tables used when making calculations. The result is that less is known by engineers in general about the proper design and requirements for an air-lift pump than in almost any other branch of engineering practice.

---

*Ingersoll-Rand Co., New York.

The original theory of the air lift was that air and water entered the pipe alternately, forming layers or pistons of air in the pipe, which forced corresponding pistons of water upward. Though there was undoubtedly some action of this sort in the older air lifts, this theory, from an efficiency standpoint, has long since been exploded.

Figs. 2 and 3 show what was the most common method of piping wells up to a few years ago. It will be seen that the air is introduced into the rising main through a large opening, so as to encourage the formation of "pistons" as already explained.

Compressed air in the air-lift pump does not push or force the column of water upward after the first discharge. When air is forced down the well to a proper point and allowed to escape into the rising main, the effect after the first emission of water from the pipe, which comes out *en masse,* is to aërate and reduce the specific gravity of the contents, which are moved upward by the buoyancy and expansion of the air bubbles, aided by the greater weight of the solid column of water surrounding the eduction pipe. Contrary to the formerly accepted opinion, the formation of large bubbles of air has been found to be detrimental to the working of the pump, as they tend to drive through the water without doing their share of useful work. The slip of the bubbles constitutes the chief loss of energy in the air lift, varying as the square root of the volume of the bubble.

It is therefore advisable to reduce the size of the bubbles as far as possible, and to this end foot-pieces are now designed to divide the air into fine streams.

Figs. 4 and 5 show two styles of modern air-lift pumps of the "Imperial" type (they are no longer called "foot-pieces"). It will be seen from Fig. 4, showing the "annular" type, that the pump is designed to take advantage of the full cross-sectional area of the well and thus give a maximum flow for a given size of well or bore-hole. The pump proper, which is usually about 8 ft. long, is provided with several rows of holes some distance apart, which are uncovered successively when the pump is started up and remain more or less uncovered according to the relative pressure and volume of the air.

Fig. 5 shows the central air-pipe system and illustrates clearly the method of piping the well. In this type the mixing chamber is considerably larger in diameter than the eduction pipe, so that the air and water are mixed at relatively low velocity and discharged at a higher velocity. The air pipe ends in a long trap to catch any scale or dirt that may be carried through the system. An added refinement, which tends toward a higher efficiency, is the air discharge, from which the cool air is generally piped back to the compressor.

DATA NECESSARY FOR CALCULATION

Although it is impossible to construct a formula which will cover all cases, the rule following will enable any engineer to calculate the requirements for any given instance, if certain data covering the case are known. Referring to Fig. 6—

Static head is the distance from the surface of the ground to the standing-water level in the well when not pumping.

Drop is the distance the water recedes when the well is delivering a certain quantity of water.

Elevation is the distance above the surface at which it is desired to deliver the water.

Lift consists of the static head plus the drop plus the elevation.

Submergence is the depth that the air pipe is submerged below the pumping level of the water in the well. There are two classes of submergence—starting submergence, which is temporary, and running submergence, which is the important factor in any pumping proposition. The latter is usually expressed in terms of the total length of the water column from the point where air is introduced to the point of discharge. Thus 50 per cent. submergence means that the total lift, or head, and the submergence are equal. The necessary percentage of submergence varies in accordance with the lift; low lifts require proportionately more submergence than high lifts. As the lift increases the necessary submergence decreases.

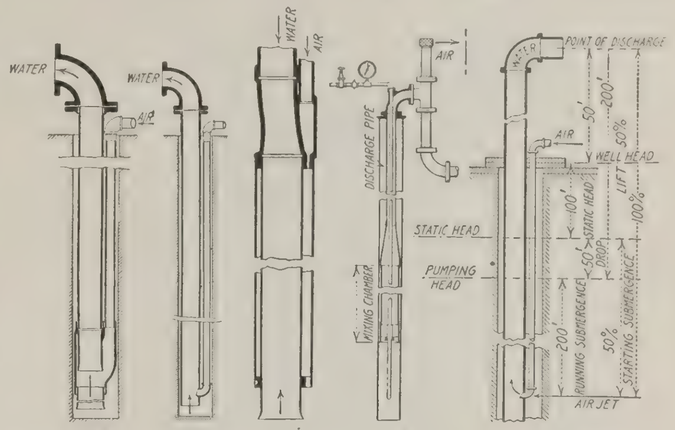

FIG.2 FIG.3 FIG.4 FIG.5 FIG.6

FIGS. 2 TO 6. VARIOUS TYPES OF AIR LIFTS AND TERMS USED IN CALCULATIONS

The range of these percentages is found within the following limitations:

For a lift of 20 ft.—66 per cent.

For a lift of 500 ft.—41 per cent.

When the total lift and running submergence are known the following formula can be used to calculate the approximate amount of free air required, and from this the compressor capacity can be figured after making due allowance for the usual losses:

Where

Va = Free air required to raise 1 gal. of water;
h = Total lift in feet;
H = Running submergence in feet;
C = Constant in table below.

$$Va = 0.8\left(\frac{h}{C\,log\,\dfrac{H+34}{34}}\right)$$

TABLE FOR VALUE OF "C" WITH PROPER SUBMERGENCE

Lift in feet (h)	Constant
10 ft. to 60 ft. inclusive	245
61 ft. to 200 ft. inclusive	233
201 ft. to 500 ft. inclusive	216
501 ft. to 650 ft. inclusive	185
651 ft. to 750 ft. inclusive	156

The necessary pressure can be calculated from the following:

Starting pressure = depth of pump (or foot-piece) in well less the static head × 0.434.

Working pressure = depth of pump (or foot-piece) in well less the pumping heard × 0.434. Friction in pipe = 2 lb. back-pressure in pump.

Since the actual pumping level in a well or a mine is seldom known in advance of a test, it is customary to assume certain conditions of lift, quantity and submergence, as experience dictates, and design the air- and water-piping accordingly.

It is essential that both the air- and water-pipes be properly proportioned because the velocity of flow is a weighty factor, and it is here that experience plays a most important part. If too large a pipe is used the air finds its way through it without doing work. If too small a pipe is employed there will be excessive friction and inefficient expansion of the air bubbles.

LATEST DEVELOPMENTS IN AIR-LIFT PRACTICE

Engineers specializing on air-lift work have learned much in the last few years. The proportioning of lift to submergence, thorough breaking up of the air, correct sizes of pipes, long sweeping bends and tees and umbrella discharge pieces to allow the water to flow along natural lines with the minimum of friction are all conducive to higher efficiency, better economy and a greater yield from a given source of supply. Along with these minor improvements have come two which are of real importance: One is known as the "booster," and the other, which is of particular interest to mine operators, is the "compound" air lift.

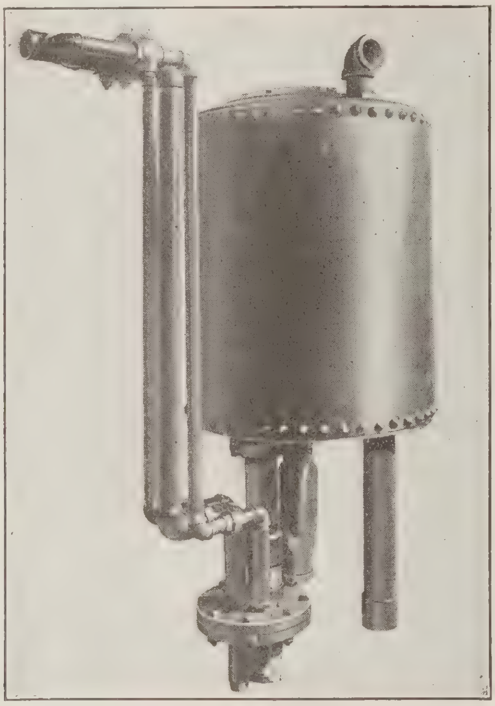

FIG. 7. THE BOOSTER TO DISCHARGE WATER HORIZONTALLY

The booster, Fig. 7, is intended primarily for forcing the water, after it has left the regular air lift, through a horizontal or sloping length of pipe to its final destination. The air lift is economical only when lifting the water in a vertical direction, and if it is to be conveyed some distance horizontally from the source of supply it is necessary to either lift it high enough to allow it to flow to its final destination by gravity or to install some supplementary means, such as the booster, to convey it after it is discharged by the air-lift pump.

The booster simply consists of a closed tank into which the air lift discharges. The air and water separate in this tank, there being sufficient pressure on the air to force the water from the bottom of the tank to its destination. The air escapes constantly from the top of the tank through a restricted opening which maintains the necessary pressure to eject the water. The air discharged is usually piped back to the compressor. The device is extremely simple and forms practically a part of the air-lift pump.

The compound air lift is a recent application of this system to mine drainage. Here a series of short lifts requiring low air pressure are installed in the shaft. Each lift is arranged to discharge into a tank from which the next lift takes its supply. The lifts are low, 11 ft. being considered the most advantageous, since it requires the very low air pressure of 5 lb., which pressure can readily be obtained from centrifugal compressors operated by exhaust steam turbines.

Since there is usually a vast quantity of exhaust steam going to waste around the average coal mine, this form of pump should prove both economical and efficient. Also, since the whole system is designed for only a 5-lb. pressure the piping, etc., can be correspondingly light and cheap; wood-stave pipes can readily be used. The exhaust air from the system should be of considerable aid to ventilation as it would maintain a strong current of air up through the shaft. In the event of a flood the compressor would simply have to be started up and the units above water level would commence discharging, those below coming into action as the water receded. This system has scarcely passed the experimental stage, but offers great possibilities.

In mines equipped with compressed air an air-lift pump can generally be used to advantage. In mines where no air is at hand the air lift has to stand its chance against other methods of pumping, and only a full knowledge of conditions and good engineering can decide between the two.

⁂

German Coal in Sweden

Owing to the scarcity of coal in Sweden, says Consul General Ernest L. Harris in *Commerce Reports,* and the great difficulty of getting it at present from England or the United States, Sweden is turning its attention to Germany. It is proposed to import the cheaper quality of coal from Silesia to mix with other coal and coke. A few days ago the Swedish State Rys. purchased 72,000 tons of German coke for delivery at Malmo at a cost of 32 marks ($7.62) per ton. Thus far the total annual imports of German coal into Sweden have amounted to about 200,000 tons.

It may be safely predicted that German coal, as a result of present conditions, will find an increasing market in Sweden. This is especially applicable to German coke, which has the advantage of selling at a lower price and can be imported cheaper than coke from England. The close of the war will find both Germany and the United States competing with England for the coal market of Sweden.

⁂

D. A. Thomas does not think the British Coal Mines Act of 1911 has really diminished the danger of underground working. During the last 50 years, there has been an enormous reduction in the rate of fatal accidents and in the death-rate of those engaged in coal mines, but it has not been shown that since this Act came into operation, there has been any decrease. Consumers of coal have been put to the cost of many millions of money, but apparently it has not led to the saving of a single life.

Centrifugal Pumps in Coal Mines

By W. A. Becker*

SYNOPSIS—The basic principle underlying the design and operation of volute and multistage pumps is here explained, as well as many constructional features which experience has shown to be important.

Since the acceptance of the centrifugal pump by mechanical and mining engineers as an efficient and reliable machine for pumping conditions in general, there has been developed in many minds the idea that wherever a reciprocating pump is used a centrifugal pump could be made to replace it. This is of course out of the question. The successful pumping of any heavy, viscous fluid, for instance, can only be accomplished by the use of the slow-moving reciprocating pump.

The question often arises, also, whether the centrifugal pump is applicable for use in coal mines, where the water is usually quite acidulous, containing considerable corrosive ingredients detrimental to cast iron coming in direct contact with it; also, whether the handling of large quantities of water against extremely high heads, as frequently met with in coal mines, could be successfully accomplished by the use of a centrifugal pump. In addition to this mine water often contains much grit and sand, especially where it is necessary to return to the surface the water which has been used in flushing silt, culm and coal dirt into the mine for surface support. This service is quite severe even for a piston or a plunger pump, the sand and grit being extremely sharp, cutting the plungers, pistons and valves and necessitating frequent and costly repairs.

Velocity Is Converted to Pressure

In discussing this subject it becomes necessary first to consider the principle and next the construction and adaptability of centrifugal pumps. The first and most important principle in the design of a centrifugal pump is that of producing the required energy in the form of velocity and then changing this to a pressure head, this to be accomplished with as little shock or disturbance of the water as possible, as shock tends to lower the efficiency considerably.

Fig. 1 shows a sectional view through an impeller in a plane at right angles to the shaft axis. The water enters the impeller at the inner circle A, having an area such that the water has a velocity of from 10 to 12 ft. per second in a line parallel to the axis of the shaft. The impeller vanes usually start on a line with the inlet opening circle or diameter to the impeller shown as D_1. Here the water is picked up by the rapidly revolving vanes and is carried at right-angles to its former direction of flow toward the outer rim of the impeller.

Because of the small angle a which the vane makes with the tangent of the entrance circle D_1, the water enters the vanes with but little increase in speed and with practically no shock or disturbance whatsoever. From this point the velocity of the water is rapidly increased, until it leaves the outer rim of the impeller at circumference D_2, where its maximum velocity is reached.

In order to produce this high exit velocity without causing disintegration of the body of water, the impeller width is gradually decreased on the curve of a parabola from the entrance, which has an area slightly greater than that of the suction, to the width at the rim, which has a total area corresponding to the required velocity of the discharge at this point. Thus the desired result is accomplished with practically no disturbance or shock.

The radial velocity of the water passing through the impeller and designated as V_r on Fig. 1 represents the actual flow of the water, as this velocity together with the width of the impeller at circumference D_2 fixes the capacity. The determination of this V_r, or radial velocity, as well as the required diameter of the impeller when the pump is to operate at a given speed against a given head, delivering a given quantity of water, is more or less complicated, and details will not be gone into here.

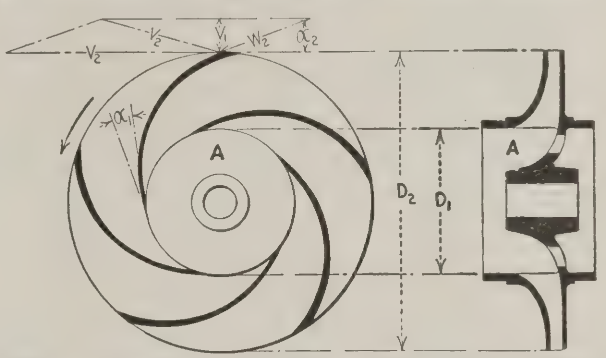

FIG. 1. THE IMPELLER OF A CENTRIFUGAL PUMP

However, the idea we wish to convey is that the velocity of the water leaving the outer rim of the impeller must represent sufficient energy so that when changed into pressure it would be equivalent to the given head against which we desire to force the given quantity of water. The width of the impeller will under these conditions control the quantity of water passing through it.

Volute and Multistage Pumps

The two most important types of centrifugal pumps are the volute, which may be either single or double suction, with open or inclosed type of impeller, and the multistage or turbine pump, always made with inclosed impellers, either single or double suction.

In the volute pump, the water upon leaving the impeller at the circumference D_2 enters a chamber in the pump casing surrounding it, known as the volute. This chamber is so designed as to have a gradually increasing circular cross-section similar to that of an Archimedean spiral. The cross-sectional area of this chamber (or volute, as it will henceforth be called) is of sufficient size to accommodate all the water from the impeller and allow it to flow through this passage at a considerably lower velocity than that at the rim of the impeller, thereby reducing the energy represented by the velocity at the rim of the impeller to a pressure head in the volute.

The gradually increasing cross-sectional area of the volute allows the water to slow down to about 12 to 15 ft.

---

*Cameron Steam Pump Works, 11 Broadway, New York.

per second at the discharge of the pump. Beyond this point the velocity is still further reduced by installing a discharge pipe having larger diameter than the discharge opening of the pump. The main reason for thus increasing the cross-section of the discharge is to avoid the excessive frictional resistance in the discharge pipe caused by high velocity, this resistance or loss varying approximately directly as the square of the velocity in any given length of pipe.

In multistage or turbine pumps of the single-suction inclosed-impeller types the individual impellers are designed so as to give practically the same results as the impellers described in connection with volute pumps. Multistage pumps, however, are supplied with two or more impellers, each succeeding impeller raising the pressure of the water an additional 100 per cent. above that attained at the discharge of the first impeller. In this manner almost any pressure within reason can be produced by simply adding a sufficient number of stages.

The water upon leaving the first impeller must be returned to the entrance of the second; hence the elimination of the volute in this case.

The method of efficiently transforming the kinetic energy of the water at the rim of the impeller into pressure, as well as changing its course from a rotary to a radial direction before it is caused to flow back to the entrance of the second impeller, has always been a subject open to discussion or argument by designers and manufacturers.

The Diffusion Vane

One method, employed by the A. S. Cameron Steam Pump Works and several other concerns, is the introduction of a stationary diffusion vane ring around the outside of the impeller. This ring is designed so as to perform the above-mentioned function—to convert the kinetic energy of the water at the time it leaves the impeller into pressure by the time it reaches the outer rim of the diffusion ring. The vanes in this ring are designed to suit the diameter and form of the impeller. Their ends, where the water enters, are tapered to a sharp point and are set at such an angle as to receive the water in a straight line as it leaves the impeller parallel to the absolute velocity V_2, as shown on the diagram, Fig. 1.

This V_2 is considered to be the actual direction of the flow as the water leaves the impeller and is determined from the relative velocity W_2, which is tangent to the curve of the impeller vane at the rim, the circumferential velocity U_2 tangent to the rim of the impeller, and the radial velocity V_r.

The water passageways between the diffusion vanes are designed to have a gradually increasing cross-sectional area, and in addition the outlet is formed so as to divert the flow of the water to a radial direction. From this point the water enters a large chamber, at a low velocity, but at an increased pressure. Here its direction is reversed by the walls of the casing, and it is caused to flow through another stationary compartment known as the channel ring, which is really only a flat, smooth surface supplied with radial vanes to guide the water and cause it to enter the second impeller in the same direction and manner as it entered the first, but under a pressure equivalent to that produced by the previous impeller.

Most diffusion vane pumps are supplied with a diffuser in each stage. In the Cameron pump, however, the impeller of the last stage discharges directly into a volute, which is generally considered the most efficient method of converting the kinetic energy of the water into pressure. The only reason that it is not used on each stage of the pump is that the direction of flow is radically different on the last stage from the others.

Some multistage pumps have no diffusion vanes whatsoever. Here the water discharge from the impeller at high velocity naturally strikes the walls of the casings with considerable force where it makes the abrupt turn of 180 deg. to enter the second impeller, and when grit or sand are present this has a tendency to wear the casing and gradually weaken it.

The water also has a rotary motion, causing a centrifugal force, which must be overcome when the water is forced back through the channel ring. This causes loss. This latter type of construction, however, has its advantages over the diffusion vane type in that it has fewer parts, is simpler in construction and cheaper. The disadvantages of the diffusion vane type are that the vanes must be designed for each particular working condition, they require much machine work, and consequently are more expensive to build.

Grit Wears Away the Casing

When a pump is handling water containing sand or grit the points of the vanes (if the casting is made of iron or ordinary bronze) will gradually wear away, which will result in disturbances in the water at this point, thereby causing losses. In order to prevent this erosion the diffuser in each case is made of extra hard government phosphor bronze, which experience has proved to be capable of withstanding quite successfully the effect of a certain amount of grit and sand at high velocity.

In the double-suction impeller type of multistage pump, so designed as to secure a nearly perfect hydraulic balance, the waterways must be so proportioned as to give a tortuous passageway to the water at fairly high velocities. This often defeats the real purpose of this type of design. There are, however, quite a few successful double-suction turbine pumps on the market. They have been used quite extensively as boiler-feed pumps in connection with steam turbine drive, as this type of impeller with its small inlet diameter can be made correspondingly smaller in its outside diameter, and therefore adapts itself to rotative speeds from 15 to 20 per cent. higher than the maximum speeds for a single-suction regular type impeller pump.

To make a multistage pump having more than three or four stages, the shaft must be large in order to be of sufficient size to prevent undue deflection, and in such cases where the heads against which it is desired to pump would require five or more stages, it is always advisable to consider using two multistage pumps in series. While this construction requires more room, as well as having possibly a higher initial cost, the efficiency of the entire unit remains more nearly constant over a given period of time. Furthermore there is less expense for repairs.

A thrust bearing is almost always supplied on multistage pumps in order to take care of the unbalanced end-thrust, as well as to keep the impellers and diffusion vanes in proper axial alignment. It is also quite frequently supplied on double-suction volute pumps working against heads upward of 100 ft. or on high speeds, so as to prevent axial drifting of the shaft back and forth due to slight pressures building up alternately on each side of the impellers.

The Marine Thrust Bearing

The most common form of thrust bearing used in connection with centrifugal pumps is the marine type, so called from being used in taking up the thrust on ship propellers. This bearing consists of a series of carefully cut collars on the end of the pump shaft, forming the outboard bearing. It is sometimes made up of a series of hardened and ground steel thrust collars fitted over the end of the shaft, which is turned down to receive them and all held in place by means of one long feather key. These collars are equally spaced by the use of small steel thimble separators.

Of the two methods mentioned for making this thrust bearing the latter is preferable, as in case one of these collars breaks or if through improper attention the bearing should burn out it would be necessary only to replace the collars, whereas if they were cut directly on the shaft itself it would mean a new shaft.

The casing surrounding the marine thrust bearing is usually supplied with a water-cooling jacket, the cold water carrying away the heat generated by the thrust collars. This water jacket is connected by small piping to the discharge side of the pump and exhausts through another small pipe into the suction of the pump.

This type of bearing will give trouble if the shaft should be sprung out of alignment, if each collar is not continuously supplied with clean oil or if the shaft is so light as to allow vibration. With reasonable attention, however, and with present uptodate machine-shop methods for turning out a first-class job, this type of bearing has, with a limited number of exceptions, proven itself quite successful.

Another method of counteracting thrust is through the use of a hydraulic balancing device. This is made in different forms, but all operate on the same principle. It consists of a disk mounted on and rotating with the shaft and placed inside the casing immediately after the last impeller of a multistage pump. The disk is made of ample diameter to allow sufficient area for the pressure of the water leaking by the bushing rings behind the last impeller to act upon and counteract the thrust in the opposite direction.

This balancing device operates quite successfully on pumps where the discharge head always remains constant, but in cases where this pressure is liable to change at any time, or if the pump is started up without priming, the disk is liable to touch the casing. The result is that at the exceedingly high surface velocity employed the two parts are liable to "freeze fast" in a few seconds and wreck the pump. This is one of the most serious objections to the hydraulic disk balancing device.

A Casing Split Horizontally Is Advantageous

The horizontally split casing on volute and multistage pumps facilitates repairs or examination of any part of the interior. In this type the suction and discharge nozzles are cast integral with the lower half of the casing and need not be disturbed when removing the top half.

In discussing the adaptability of the centrifugal pump to meet various conditions, we will consider the different types of this machine and the conditions under which they can be used successfully.

First, the open impeller pump, which is extremely simple in construction. It has no bushing or wearing rings to seal the impeller against slippage, but the casing is made to fit close to the impeller with very little clearance. For this reason this type of pump is not good for much higher heads than 70 ft., as beyond this the pressure becomes so great as to cause water to slip by the impeller back to the suction. The simplicity of design and the absence of wearing parts in contact with the water make it an ideal pump for handling water containing much sand or grit or even for fluids that are more than ordinarily sluggish, as there is little chance for the pump to clog. This type is least efficient of any of the centrifugal pumps, but is best adapted for rough usage and the handling of dirty, gritty water or even sewage, providing the head does not exceed the 70 ft. as before mentioned.

Second, the inclosed impeller volute pump, double-suction type, which is more refined in its construction and also more expensive than the open impeller type. This pump is usually built for heads as high as 200 ft., and sometimes as high as 230 ft. per single impeller. These extremely high heads, however, require high speeds, unless the impellers are made exceptionally large. In this case, however, it is ofttimes found that the standard casings as built by American manufacturers are too small to allow the use of a very large impeller for high heads or ordinary low speeds. This is due possibly to standardization for manufacturing purposes.

These pumps are quite adaptable for coal mines in handling either pure, acidulous or gritty water. When handling pure water the impeller can be made of cast iron. The shaft sleeves and impeller bushings or wearing rings are always made of bronze. When handling acidulous water the impeller should be of bronze, while if the water is extremely acidulous the entire casing, and in fact all parts coming in contact with the liquid, should be made of acid-resisting bronze. When these precautions are taken, this type of pump will handle acidulous water quite as successfully as fresh water. When the liquid is gritty the impellers should be made of hard phosphor bronze in order to prevent wear. The efficiency of this type of pump ranges from 65 per cent. on the 3-in. size to 75 per cent. or even 80 per cent. on larger sizes, say 10-in. to 12-in. and over.

Third, the multistage or turbine pump, which operates on much the same principle as does the inclosed-impeller volute pump. Each impeller in a multistage pump can be made to operate against a 200-ft. or even a 230-ft. head; and a multistage pump with four impellers, each designed to operate against, say, a 200-ft. head at a given constant speed, will discharge against a total head of 4 × 200 ft., or 800 ft.

This type of pump will operate successfully when handling either fresh or acidulous water, providing the material of which the impellers, diffusion vanes and casings are made is capable of withstanding the corrosive action of the water being handled.

Centrifugal Pump Is Adapted to Coal-Mine Service

The centrifugal pump, because of its simplicity, durability and reliability, has proven itself to be almost ideal for use in coal mines. It requires but little head room and floor space; it can be direct-connected to an electric motor, and it is practically immune from the effects of coal dust on the bearings, which are all totally inclosed.

This latter is in marked contrast with electrically driven reciprocating pumps.

There are only two bearings on the pump and two on the motor, and all are of the ring-oiling type with large oil reservoirs, which require filling about once a week. There is practically no packing trouble in comparison to reciprocating pumps, as the only movement of the shaft on a centrifugal pump is rotary and not axial.

It is always well to remember in selecting a centrifugal pump for coal-mine service, which service is usually severe, that the cheapest type or the cheapest pump is not always the best investment, as the very best of machine work is required in order to turn out a properly aligned and efficient centrifugal pump.

⁂

Extracts from a Superintendent's Diary

There are days when I enjoy every minute of the time spent at my office—today has been such a day.

At 6 : 30 my office-boy called me on my residence phone to tell me that a pit committee was waiting to see me at the office. I hurried over, knowing that the committee had made the early start that they might finish their business with me in time to enable them to go to work. This meant that they did not want to lie around all day and charge their time up to the miners, which they have a perfect right to do.

Within ten minutes after my arrival we came to an understanding, and the committee went on its way smiling. I had a kindly feeling for the committeemen because of the consideration they manifested for the miners they represent; they had a kindly feeling for me, realizing that I had come to the office nearly an hour before office hours. How easy it is to come to an understanding when there is good-feeling and esteem between adversaries.

Just after the committee left, my office-boy sidled in and asked for a half-day holiday. He wished to attend a ball game, but he didn't say so.

"Why were you here so early this morning, Tom?" I asked.

His countenance fell; he had figured that I would grant the holiday as a reward for his having been at work so early, but the expression on my face made him fear that I had discovered that his early arrival had been accidental and owing entirely to a crazy clock that wouldn't keep time.

His disappointment was so keen, however, that I weakened and granted his request. His victory following apparent defeat made us both smile.

About 10:30 our general manager called me by long-distance telephone to tell me that our sales manager had just closed a contract for enough coal to insure us five days' operation per week in place of the four that we have been running. Incidentally he remarked that we got this new contract in the face of keen competition, largely because our coal has the reputation of being more carefully prepared at the mines than other coal from our district. For several years I have realized that our coal is the best-prepared coal in our district, because I have kept close tab on all of my neighbors, but never before has our general manager admitted as much. I smiled at him; what a pity he couldn't see the smile!

About 3 o'clock Mr. Styles, the assistant state mine inspector in charge of the mines of our district, came into my office, having finished his quarterly inspection of our mines.

"Mr. Thompson," he said, "if all of the mine foremen in the state would carry out the instructions that we inspectors feel called upon to make, in the same spirit that your foremen do, the inspector's job would be one of the most pleasant imaginable. But you'd be surprised if you could see the treatment most of the foremen give us. Every criticism that we make is resented, and if we make a suggestion that reflects in the least upon their management, they get busy to see if they can't find something in our past history that might assist them to discredit us. We realize that the superintendents are responsible for a good deal of this feeling, because if they didn't encourage their foremen the foremen would soon change their tactics."

Flattery perhaps, but it started me home from the office grinning from ear to ear.

⁂

English Trade Difficulties

The war has brought about a noticeable increase in cost of production in the colliery industry of both Bristol and the Forest of Dean district, says Consul J. S. Armstrong, Jr., in *Commerce Reports;* and in spite of the high prices now obtained, which range from 30s. ($7.30) to 32s. ($7.79) per ton, there has been a considerable reduction in profits. There has been a shortage of labor at the collieries owing to enlistment, and a consequent reduction in output to the extent of 33 to 50 per cent.

At the annual meeting of one of the leading colliery companies of this district (Bristol) the following statement was made:

> During August and September the British Admiralty was making abnormal demands upon the collieries, and this tended to disorganize the ordinary trade. Later, when the naval requirements abated, there was some delay in the resumption of ordinary trade occasioned by difficulties to be confronted by consumers in obtaining transportation facilities.

Other important factors in the increased cost of coal have been higher freight charges and the shortage of pitwood.

The report of the committee appointed by the British Government Board of Trade to inquire into the causes of the present rise in the retail price of coal was published recently. The recommendations are:

> Exports to neutral countries should be restricted.
>
> Steps should at once be taken to consider, in consultation with the public bodies concerned, the question of the accumulation by such bodies of reserves of coal in or near London for the use of small consumers during next winter.
>
> The rates of freight on interned steamers should be further reduced.
>
> Suitable enemy ships condemned by the prize court should be taken over by the government and used for coal transport.
>
> If prices do not shortly return to a reasonable level, the government should consider a scheme for assuming control of the output of collieries during the continuance of the war.

The committee in its report, which it explains is concentrated mainly upon London, states that recently large quantities of inferior coal which in ordinary times would find no market in London have been supplied to the consumer, under one designation or another, at very profitable prices.

⁂

For every ton of coal raised from one of the anthracite mines, the operators of that field are obliged to pump to the surface about 11 tons of water. It is estimated that in the anthracite mines, there are 900 pumps in use at the present time. The capacity of these pumps is approximately 1,000,000 gal. a minute.

A New Sinking Pump

By Alden W. Baldwin*

SYNOPSIS—The ordinary type of sinking pump is suspended in the shaft by a cable and must be raised whenever a shot is to be fired. This new pump works in a borehole beside the shaft, the power head being placed on the surface out of harm's way.

The earliest point where water may hinder development in coal mines is in shaft sinking. In some cases the strata penetrated are so formed that the water may seep away and the shaft be thus self-draining. If this is not the case some mechanical means must be provided for delivering the water at a point sufficiently removed from the shaft opening, so that it cannot interfere with operation. For this purpose the sinking pump, or "sinker," was especially designed and built to meet the severe conditions encountered in this service.

Sinking pumps may be either steam or electrically driven, the steam pump being the earlier type and the one which is more extensively used, even at present. Successful steam pumps long antedated the electric-driven machines. Furthermore, they would stand much harder usage than the earlier models of motor-driven pumps.

There has not been (until comparatively recently) a wide application of electricity to mining work. During the past few years, however, progressive pump manufacturers have developed successful motor-driven sinkers, which are now recognized as more satisfactory in many instances than steam sinking pumps.

From the nature of the work to be performed, the pump must be so supported that it can be easily raised and lowered in the shaft. It must always be kept within suction reach of the water when at work and must usually be raised a considerable distance above its normal working position when shots are to be fired. These requirements make it desirable that the sinker be not too great in weight or size for hoisting by cables and for easy handling.

All sinking pumps must be substantially built, so that they may operate for long periods without danger of failure, and this, too, with a minimum of attention. They must be provided with sufficient covers or inclosing shields so that flying débris, in case a shot is fired or a tool carelessly allowed to fall into the shaft, will not be likely to cause damage. In these respects the steam pump, with its compact design, appears to have the advantage, but properly designed electric machines have repeatedly proved their worth when tested under the severest service conditions.

It is difficult to give figures when comparing the relative economy of the two principal types of sinking pumps. It is not necessarily the efficiency of a machine that determines the value of either type under given working conditions. Of the two types, the electric sinking pump is doubtless the more efficient.

Ordinary Sinkers Have Many Disadvantages

It is evident to all practical mining men that at its best neither form of sinking equipment mentioned is what is really desired. Hauling the pump up in the shaft out of harm's way every time a shot is to be fired delays operation. This delay is only partly obviated if the pump is allowed to remain near the bottom, behind a rough shelter of timber. Furthermore, a pump that cannot be harmed by submerging for a considerable time would prove a great advantage in situations where flooding is liable to occur. Recently, a pump for use in shaft sinking has been introduced which combines the high efficiency of the ordinary triplex plunger machine with the ability to overcome the conditions mentioned above. This pump is entirely new in principle as applied to mining work, but the application of machines somewhat similar in design has already proven successful in a number of instances.

The pump referred to is the Glendora triple-plunger deep-well pump, designed to lift water from considerable depths by means of a working barrel placed in the water near the bottom of a borehole. This barrel, or cylinder, contains three plungers, operated by long rods driven by a power head at the surface of the ground. The borehole in which the pump operates may be placed adjacent to, but just outside of, the side of the shaft that is being sunk. The barrel may be placed down as far as it is intended to carry the shaft, or it may be found preferable to move it down occasionally as the sinking progresses.

Accumulated water in the shaft may be admitted to the borehole at intervals by punching through the intervening strata so that the water can drain off, it being then forced from the bottom of the borehole through the column-pipe to the top. In some instances it has been found unnecessary to make these drains connecting with the pumping equipment, the strata being such that drainage of the shaft takes place through fissures in the rock. Other developments have been handled by putting down two borings—one, as described above, close to the outside of the shaft and another in the shaft itself. In this way the water in the shaft drains through the hole in the floor and is delivered to the pump through underlying strata sufficiently porous to allow the passage of water from one hole to the other. Care must of course be taken to keep unobstructed the hole in the shaft.

The Pump Head Is Gear-Driven

The power head of the Glendora pump has a gear-driven crankshaft supported in bearings on a heavy frame; also five connecting-rods transmitting motion to three crossheads which move up and down in guides in the frame casting.

Although there are five crankspins and five connecting-rods, the pins are not spaced equally around the crank circle. The center crankpin makes an angle of 120 deg. relative to the two which are nearest it on either side, these two being on a common center line with each other. They, in turn, are at an angle of 120 deg. with the two pins nearest the end of the crankshaft, which also have a common center line. The outside connecting-rods move up and down together, as do also the second pair of connecting-rods.

The working barrel contains three plungers, one above the other, operated by means of long rods which transmit

---

*No. 720 Hampden St., Holyoke, Mass.

the driving power from the pump head at the surface. These rods comprise a central solid rod inside of a tube, or pipe, which is itself inside of a second tube. The end of the solid rod is attached to the lowest plunger, its upper end being actuated by the center crankpin at the power head. The lower end of the intermediate rod, or the one within which the solid rod works, is attached to the middle of the three plungers and is driven up and down by the two cranks next to the center crank. The upper plunger is driven by the outside one of the three rods, the upper end of which is attached to the lower crosshead. It is driven by the outside pair of cranks.

Each plunger has a heavy bronze valve seating upon its top: Each valve seats firmly upon the up stroke, unless the plunger above or the one below it is lifting or forcing water through this plunger. Thus, as each plunger reaches that portion of its stroke in which it is moving at a greater speed than the other ascending plunger, its valve will seat gently and assume the load of the water column. As the speed of this plunger gradually decreases another is attaining maximum speed, and this in turn assumes the load when its valve closes, thus allowing it to lift water through the plunger below it by means of suction or force water through the one above.

Each plunger carries the load of the water column for only a portion of its up stroke, or while moving at or near its maximum speed. Thus, the water in the column-pipe is kept moving continuously and smoothly at the highest allowable velocity. This is in decided contrast with the operation of the common single- or double-acting working valve usually employed and results not only in high efficiency, but also great reliability, the rods and power head being relieved from the shocks which are inevitable in pumps requiring the overcoming of the inertia of the water column at the beginning of every stroke.

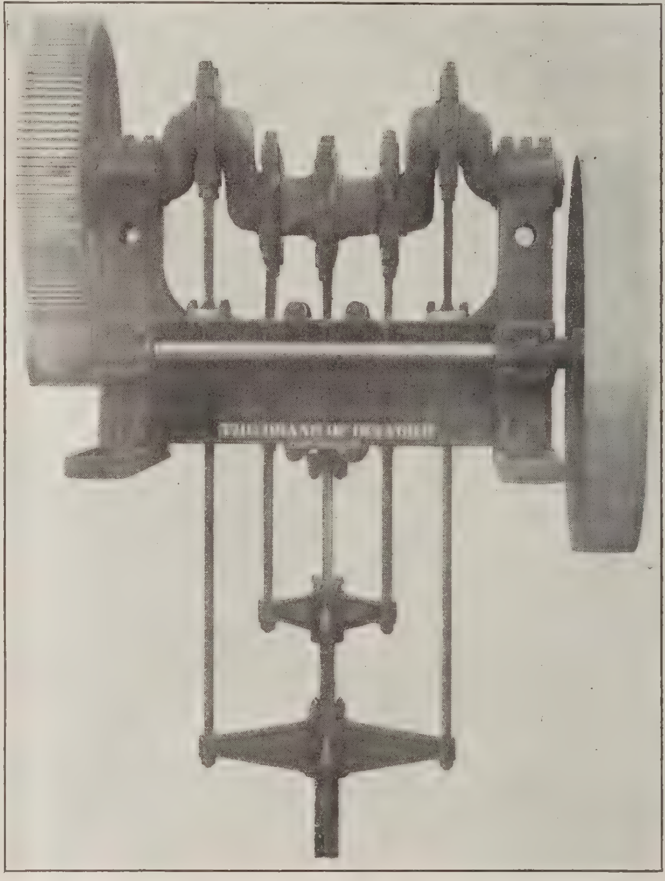
The Pump Is Efficient in Power Consumption

The superiority of the triplex electric sinker over the duplex steam pump as regards efficiency in the use of power is maintained in the pump above described. The three plungers are operated by cranks set 120 deg. apart, and a smooth flow of water tends to give the best results. Every acceptance test of this pump has shown an efficiency of 80 per cent. or better for the pump alone.

But this high efficiency is not the only advantage to be found when the pump is employed for shaft sinking. Much time is saved in keeping the pump at work regardless of the firing of shots. There is no need of hauling the pump up out of the way or of putting up timbers to keep it from damage by flying rock. It is shielded by a wall of solid rock as thick as may be desired. The time saved in sinking a shaft by the use of the deep-well type of pump has been still further increased by the fact that larger charges of explosives may be used without endangering the operation of the pumping equipment.

The water end of any mine pump must be able to withstand the grit always encountered in this service. This is especially true of a sinking pump. The design and construction of the Glendora working barrel render it capable of long-continued operation with a minimum of wear. It is also easy of inspection and repair and will handle grit with less trouble than many other designs. On account of the continuous upward movement of the water column, the flow causes all grit to be carried along through the plungers without chance of its being deposited on the valves or their seats, as might be the case if the flow was stopped at the end of every stroke. The leather cup packing around the plunger is easily renewable at slight expense.

When such a pump is installed for sinking purposes the working barrel need be placed only so far down as to insure keeping the operation free from water for a given period. After the sinking has progressed as far down as the water end of the pump, this may then be put still further down in the borehole. In this way the pump becomes a first-class station pump after the shaft is finished.



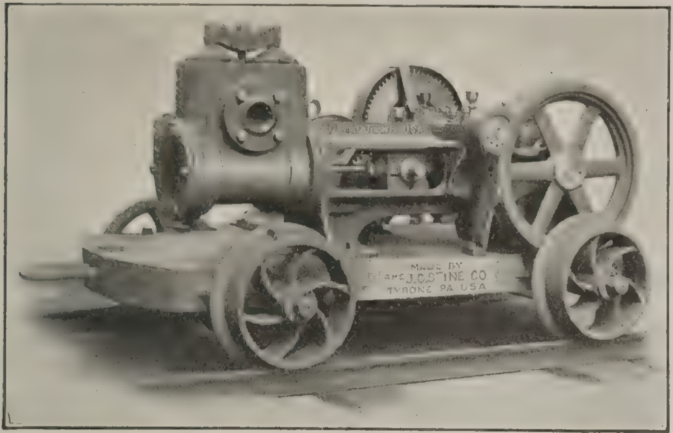
The Pump Head Showing Five Connecting Rods and Three Pump Rods

If at some future time further development is necessary the borehole may be sunk deeper and the necessary length added to the column-pipe, the pump being then ready to keep the new part of the shaft free from water, while sinking and for draining the lower levels when they are completed. As a station pump this has an advantage over other types, since it can never be flooded out, as the power is applied to it at the surface of the ground and the only part in the mine works better if below normal water level.

The Glendora triple-plunger pump has been designed and patented by the Deane Pump Co., Holyoke, Mass., by which company is has been manufactured for some time. It is built in a number of sizes for 100 hp. or less and for capacities ranging from 150 to 3000 gal. per minute.

A New Portable Pump

One of the most annoying problems around coal mines is the elimination of water from the working-face of the rooms or entries where these are not self-draining. In such a case it is necessary to install some kind of a pump, usually known as a gathering pump, to transfer the water from the working-face to some central point where a large pump may eject it from the mine.



The Pump on Its Truck

Such a gathering pump as manufactured by the J. C. Stine Co., of Tyrone, Penn., was described on page 380 of Coal Age for Feb. 27, 1915. More recently, however, another improvement has been added to this pump. This consists in making the bedplate of the pump the platform of a truck which may be made to fit any gage of mine track and is provided with removable truck wheels.

As a gathering pump is of necessity temporary in its nature and used in one place for only a short time, this feature of building the bedplate as a truck will be at once appreciated by mining-men. The pump may thus be readily transported from one portion of the workings to another and blocked in place on the track while a place is being pumped out or it may be removed from the track and blocked in position on the mine floor. In case the pump may be wanted in one position for any considerable length of time, the wheels of the truck may be removed and laid to one side and the bedplate mounted on a light foundation in the usual manner. It will thus be readily seen that the truck bedplate adds the feature of flexibility to a piece of equipment the utility and reliability of which have already been clearly demonstrated.

⁂

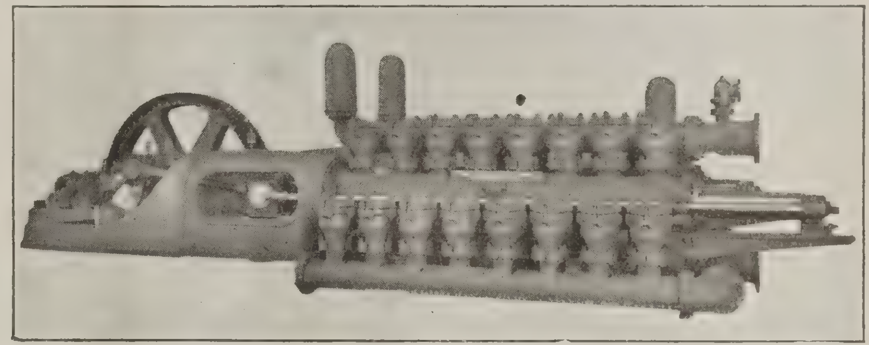
High Efficiency in Mine-Pumping Machinery

The use of electricity for power distribution in coal mines is increasing so rapidly that the necessity of keeping the cost of current at a minimum is receiving the most careful attention. Among other equipment in which a marked saving is possible the mine-pumping machinery assumes an important place; and to secure such a saving the adoption of pumps of the highest possible mechanical efficiency is necessary.

The accompanying illustration shows a mine pump of high efficiency. This machine was built by the Epping-Carpenter Pump Co., of Pittsburgh, Penn., and represents the standard practice of this builder. This machine is a horizontal duplex double-acting unit, having plungers 8½ in. in diameter with a 24-in. stroke. The pump is of the direct-flow pattern, and is guaranteed to deliver 1000 gal. per min. against a total head of 800 ft., with an efficiency of 88 per cent. Machines of this type are also built in 36-in., 42-in. and 48-in. stroke, with guaranteed efficiencies ranging from 90 to 92 per cent.

A study recently made, in connection with a certain coal-mine installation, of the relative costs of power for reciprocating and centrifugal pumps showed that the saving through using the reciprocating in preference to the centrifugal type of machine would pay for the difference in cost between the two in from 1½ to 2 years.

It will be noted that in the design of the pump here shown many features are embodied tending toward high efficiency. Among these might be mentioned the following: The direct flow of the water through the pump; that is, no reversal of flow, which eliminates shock and consequently secures a rounding-off of the peaks on the amperage curve. The use of leather-faced pump valves, and of cut herringbone gears, pinion and pinion shaft being made from one forging. Four-part adjustable main bearings; the bearings provided for the pinion shaft, are ring-oiling and made with removable shells. They are adjustable as to position, insuring perfect parallelism of gear and pinion teeth. The shafts are supported in two main bearings, securing perfect alignment. All bearings are unusually large, while the frames are in one piece, resting upon the foundation throughout the entire length.



The Power-Driven Duplex Plunger Pump

The pump illustrated herewith is installed in a mine where the water is unusually good. The same type of machine is, however, manufactured with complete wood lining for installation where bad mine water, such as is encountered in many localities in western Pennsylvania, is to be handled.

⁂

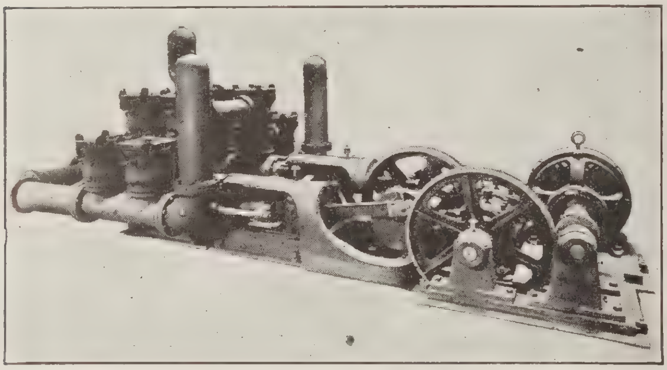
If an alternating current be transmitted through a conductor, portions of the electric energy supplied may be transformed into heat in four different ways, each resulting in an energy loss and in a corresponding reduction of the current-carrying capacity. These losses are: the energy required to overcome ohmic resistance, a loss of energy due to skim effect, foucault or eddy currents and dielectric hysteresis losses in the insulating material. While the amount of heat developed under ordinary service conditions by any one of the last three mentioned causes would probably be small, the aggregate amount tends to increase the temperature of the conductor, which increases its resistance, reduces its carrying capacity and shortens the life of the insulation.

Wood and Lead Lined Coal Mine Station Pump

The accompanying illustration shows a duplex double plunger electrically driven mine station pump of the wood and lead lined pattern built by Boyts, Porter & Co., Connellsville, Penn. The size of this machine is, plungers, 10 in. diameter, 12 in. stroke, piping 12 in. suction and 10 in. discharge. It is operated by a 75-hp. Westinghouse 230-volt d.c. motor, through double-reduction cut herringbone gears of the Falk type.

This type of pump embodies the practical experience of over 45 years in dealing with mine pumping at first hand. It is built heavy and strong and of the best grade of material, the bronze employed being especially prepared for resisting the action of mine water.

All portions of the entire water end of the pump are protected by wood lining wherever possible. Where this is impossible—as for instance, in the case of the neck of valve chambers and the lids therefor—it is protected by lead cast solid to these parts. The result is a pump which is extremely durable and one which will resist the action of mine water for a long period of time.



Reciprocating Pump with Double-Reduction Herringbone Gears

Before the present method of wood lining pumps was evolved, an entire water end of bronze was the only type that would endure. This was extremely expensive. The writer recalls some of the larger sized pumps installed in the Connellsville region with bronze water ends which weighed approximately 7½ tons. The mine water here encountered was so strongly acidulous that a cement lined water end would eat out. Enamel also proved useless in protecting cast-iron parts.

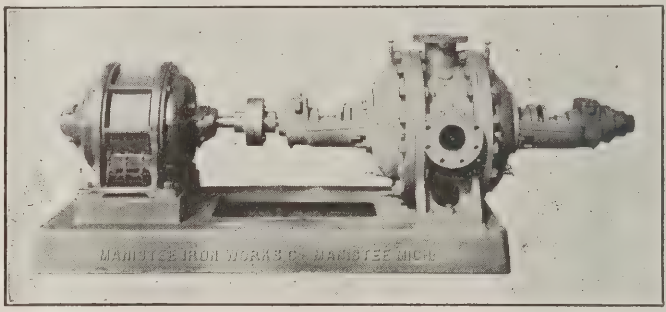
The lining of pumps with wood met these conditions admirably, not only securing greater durability and saving in repairs and attention, but also in first cost, and has proved beyond doubt the advantages of the wood lined type of pump in many years of constant service.

The demand for electrically driven mine pumps is fast exceeding that for those of the steam- or air-driven type. Many of the older mining operations have electrified, thereby effecting a considerable saving in the cost of pumping. This has been shown by test.

A recent test made to show a comparison of cost between electrically driven pumps and the old system of steam- or air-driven machines showed a reduction from 750 tons of boiler coal per month with three shifts of firemen, three pumpers and three assistants to 300 tons of coal per month with one pumper and two firemen. Furthermore, there was a decided increase in output.

A New Type of Centrifugal Pump

As centrifugal pumps are ordinarily built, an impeller is employed for each stage. The Rees Roturbo multistage pump employs the principle of impellers in series and has one-half as many impellers as there are stages. Each impeller has a double eye and answers for two stages. Because of this fact it is possible to reduce the overall dimensions of the machine and at the same time obtain a perfect hydraulic balance or neutralization of end thrust by means of conducting the water from one stage to the next in a proper manner.



A Single-Impeller Pump

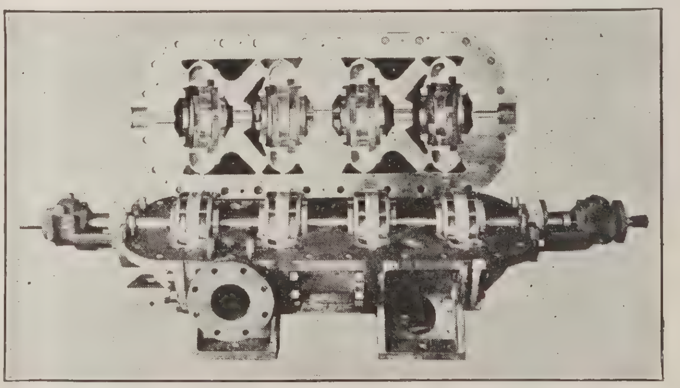
The impellers are of bronze or cast iron, fitted with renewable eye-rings which mate with renewable casing-rings, both being internally lubricated by water under pressure.

A flat bridge between the stages of each impeller eliminates leakage. The impellers are keyed to the shaft and held in position longitudinally by means of bronze sleeves which cover and protect the shaft and are keyed to and locked upon it, thereby holding the impellers securely in position.

Each diffuser is of such a type as to contain the diffusing passages of each impeller; thus two diffusers are really combined in one, the overall dimensions being thereby reduced.

The pump shaft and impellers are supported in two bearings lubricated by double oil rings, while the bearings are supported on brackets on either head of the pump and are external to the casing. The glands are ample in size and are sealed by water under pressure.

The standard casings are sufficiently heavy to easily withstand any stress to which they may be subjected. They are split vertically and all water joints are made tight by lead packing. In the tail-bearing bracket is placed a



Multistage Pump with Top of Casing Removed two-way ball thrust, which serves the purpose of keeping the impellers in line with the diffusers.

Pumps of this type obtain a high efficiency over a wide range. This range generally extends from 50 to 70 per cent. on either side of the normal duty point, without dropping over 5 per cent. from the highest efficiency.

The chief reason for this high efficiency over a wide range of duty is the fact that the impellers, being drums or reservoirs of considerable size, have a capacity such that the water passing through them moves slowly. This reduces the friction in the impeller without the necessity of polishing its inner surfaces.

This slow movement of the water through the impellers and other passages of the pump has many advantages, chief among which is the fact that under these circumstances the abrading or wearing away of the impellers, casing and diffusers is much less when handling gritty water or that containing sand than in pumps where the water velocity is high. Under these circumstances the normal efficiency of the pump is maintained over a considerable period of time.

A Gathering Pump Embodying Some New Ideas

Although the initial outlay in one gathering pump is comparatively small, it should be considered as important, as in most cases it is necessary to use a considerable number of these machines scattered about the mine. For this reason, the investment should be considered not as applying to a single machine representing a small amount, but as applying to a number of pumps amounting in the aggregate to a large sum.

The extent to which a mine depends upon the gathering pump should impress the manufacturer with the importance of designing and building such a machine for service rather than to sell at a low price. The extent of development and the rate at which it may be carried on are largely dependent upon the service rendered by the gathering pump. If working-places cannot be kept dry, too great a number of such places are required in order to secure a given production, and the development cost becomes excessive. On the other hand, if water cannot be kept away from the faces in advancing headings, the development is slow, and not enough working-places can be secured to insure a given tonnage.

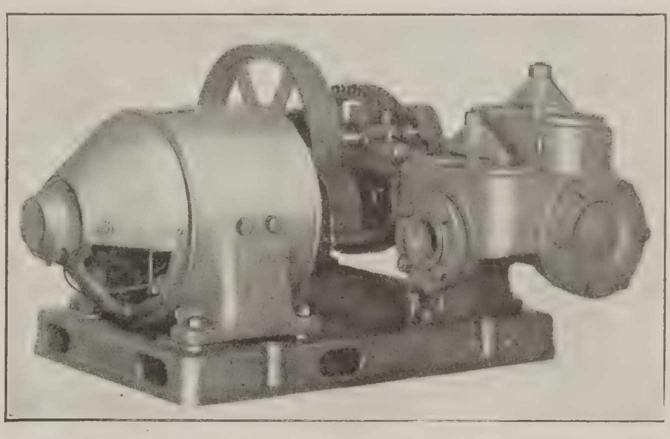
It is therefore of first importance that the gathering pump employed should be reliable in every particular. Next to reliability it should be obtainable at the lowest price consistent with known quality.

A pump that has been designed and is being built with this idea in mind has been recently placed upon the market by the Pneumelectric Machine Co., of Syracuse, N. Y. Some features of unusual interest have been embodied in its design.

There has always been a divergence of opinion among mining-men as to what constitutes the most desirable features for pumps of this kind. In order to ascertain what ideas were most commonly held concerning the various points to be taken into consideration in the construction of such a pump, many practical as well as scientific mining-men were consulted, and the pump as now made represents the composite of ideas thus secured.

Advantage has been taken of the careful study and practical application of the use of different alloys and the special heat treatment thereof in order to produce parts of the greatest strength and longest wearing qualities. The material used for each individual element has been selected, therefore, particularly for the service which it is to perform, both with respect to strength and wearing qualities. Simplicity has also been carefully studied, so that but few parts are employed, all of which are easy of access, both for examination and replacement. In addition to this the method of oiling and lubrication is unusual and has proved to be quite satisfactory.

The pump is of the piston type, with a stuffing-box of ample size and easily accessible. The piston design has been carefully worked out, and no small bolts or tapped holes which are liable to corrode have been employed. All studs in the cylinder are anchored in bottomed holes in order to protect them from the effect of acidulous water. The pump lining is pressed into the bore thus eliminating the necessity for screws, while all openings and water passages are exceptionally large, allowing the water to flow through the pump with but slight resistance.



THE PUMP AND ITS DRIVING MOTOR

All bearings are of bronze, so that their replacement or repair may be accomplished without removing the pump from the mine. All bearings are lubricated by a felt wiper oil reservoir system. This entirely eliminates the use of oil cups or other devices which may require attention at the time of starting or stopping the pump. Reservoirs are cast into the frame at points near the bearings, with openings leading thereto. These openings are provided with wicks, so that oil is fed to the shaft only at such times as it may be in motion. These reservoirs are carefully covered to prevent the entrance of dirt, but are easily accessible and may be readily cleaned.

The crosshead guides are also lubricated from an oil reservoir cast into the frame. The connecting-rod is provided with a suitable oil reservoir, which is connected to each bushing by channels through which the lubricant is forced by the splashing caused in the reciprocation of the rod. Felt wicks and grooves cut in the bushings distribute the lubricant uniformly and to a proper amount over the bearing surfaces.

This system of oiling not only results in economy but also insures the proper lubrication of all surfaces with the least amount of attention, and is consequently a highly desirable feature in connection with a machine of this kind that must be employed at distant points and frequently started and stopped without having an attendant make certain that it is in proper working condition

In order to make it possible to start and stop this pump without the necessity for a man going to it, a motor is employed which can be thrown directly onto the line without the necessity of a starting resistance. It is therefore possible for the pump to be started by simply throwing a switch in the power house or at any other convenient point in the mine.

In many cases the use of acid-resisting materials in the water end of the pump becomes necessary on account of the strong acidity of the water encountered. Special attention has accordingly been given this point, and an acid-resisting material of high quality has been secured from which to construct the water end. The pump has been operated in some of the strongest mine water to be found, and the results have been highly satisfactory. The material employed has fully demonstrated its ability to withstand extremely strong acid water without undue deterioration.

The water end is constructed of materials suited to the kind of water that is to be handled. The pump can therefore be procured with plain cast-iron water end, with acid-resisting cylinder lining, piston and rod, valves and valve seats, or with a solid acid-resisting water end.

The base is constructed so that axles may be employed and truck wheels placed thereon, so that the pump may be easily moved from one place to another. It is believed by the manufacturers that every point has been considered in connection with this pump and that a machine has been produced of the greatest reliability at a comparatively small price.

⁂

An Acid-Proof Pump

By C. W. Crawford*

In the development of pumps used in mines the original plan was a vertical plunger or piston driven by a crank and gearing at the surface. In the plunger pumps, the plunger and pump-rods were designed to equal about one-half the weight of the column of water to equalize the power on both strokes, the plunger being arranged to work through a chamber or cup of oil on the stuffing-box whereby the lubrication was constant and directly applied. This was the best of all mine pumps when properly installed—then called lifting pumps.

Piston pumps were used more or less at the same time, 50 years and more ago. In the latter the cylinders were bored, but not always lined with brass, and the bucket plungers made of brass were fitted with cup leathers in a substantial way. But in those times, as now, the acid water played havoc with the cylinders. These were used in some of the extensive mines in Pennsylvania with very indifferent success.

Later on, during the Civil War, direct steam pumps came into use, and these, like the bucket plunger type, were at first made with plain iron cylinders, which gave trouble in acid water. Later pump-makers used liners of rolled brass fitted with butt joints. These soon wore out and made more trouble.

Plunger Pumps Have an Advantage When Worked Vertically

The steam pumps held the field when fairly introduced because of their convenience and portability, but it was soon found the cylinder liners had to be of more substantial material than sheet brass. The majority of the pumps to the present time have been piston pumps, but the plunger pumps have some advantage when worked vertically, as above stated. The valve seats of all pumps give as much trouble as the cylinders, while pump-rods and pistons fare very little better in strong acid water. The experiment of babbitt-covered rods has met with considerable success in the hands of careful engineers, but this cannot be considered permanent.

The principal terror of the coal-mining trade consists in the vicious acid water found in nearly all mines and its action on the pumps discharging it. The dullness of the coal trade is discouraging, but it is temporary, while the menace of the acid water is perpetual and everlasting whether the mine is working or idle. Plenty of pumps are to be had in the market, and all of them are efficient for the time being, but they are not built to resist acid water indefinitely; hence the duty of the pumpman is more or less onerous, and it frequently happens that pumps of the most reputable makers are eaten up past repairing in six months.

These are iron-body pumps with bronze cylinder liners, pistons, rods and valve seats, all parts of which are attacked by the acid, aggravated by the friction of packing and the wash of the water. Solid bronze water-ends are subject to the same wear and tear and frequently give out in a year. The ultimate fact in the pump proposition is that there are but few acid-proof pumps adapted to mining purposes.

The history of one such machine is a long story of partial success and partial failure in combating the enemy. The wearing parts of this particular pump are of a metallic composition that is as hard as tempered tool steel, and at the same time proof against all the ordinary acids contained in mine water; hence the wear is reduced to a minimum, and the life of the pump, barring accidents and abuse, is prolonged indefinitely. The preference is given to piston pumps for the present, but plunger pumps will be included later. As a necessary consequence the added material and labor will enhance the cost of these pumps somewhat, but the slight advance will be rebated in the reduced operating expense and the longer life of the pumps, every part of the interior of these pumps being practically invulnerable.

The acid-proof pumps designed for mines and referred to in the foregoing are built by Crawford & McCrimmon Co., Brazil, Ind. They may be driven by steam or electricity.

⁂

A Monster Centrifugal Pump Installation

Modern engineering enterprises are, wherever possible, conducted on a gigantic scale; for it has been found here, as in business, that doing things by wholesale is cheaper than retail methods. A recent case illustrating this occurred in New Orleans, where very large quantities of water had to be handled in drainage work; and to meet the requirements four immense centrifugal pumps were ordered, which are said to be the largest of their kind in the world.

These big pumps have a delivery opening of 78 in. diameter, and are capable of delivering 168,000 gal. of water per minute at a 1-ft. head, which is equal to the flow of a good-sized stream. The head of water will vary under different working conditions from 1 to 13 ft., and at this latter difference of level 90,000 gal. per min. can be handled; but the pumps are required to turn much faster than at low lifts, for whereas they do their work at 55 r.p.m. when the head is but 1 ft., it requires 113 r.p.m. to move the stated amount at the 13-ft. head. This, however, is by no means excessive, and the pumps will be economically operated by Nordberg-Corliss compound condensing engines.

---

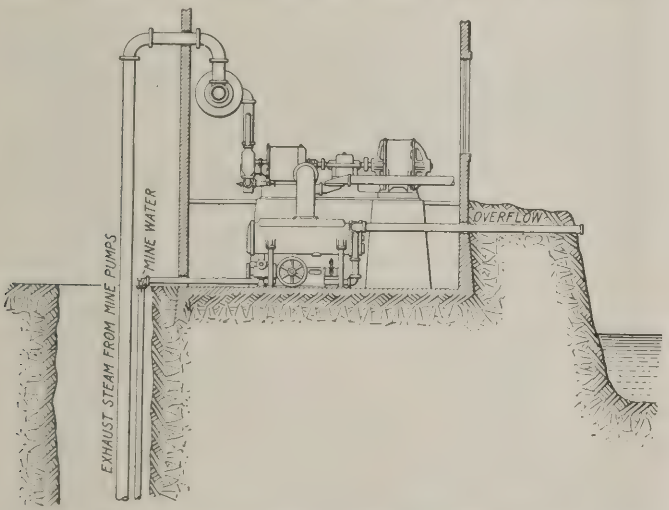
*President, Crawford & McCrimmon Co., Brazil, Ind.

Besides these monsters there is a fifth pump in the outfit which has an outlet of 48 in. and a capacity of 47,500 gal. per minute at a 3-ft. head, as against 156,000 gal. at the corresponding lift by its big brothers. These pumps are built by the Southwark Foundry & Machine Co., of Philadelphia.

Securing Power from the Exhaust of a Pump

At many coal mines direct-acting steam pumps are employed under ground to rid the workings of water. This water is raised to the surface and discharged into some nearby stream or watercourse. The steam after operating the pump is piped to the surface and allowed to escape into the atmosphere.

The accompanying illustration shows how some of the heat contained in the exhaust steam may be utilized for the generation of electric current. The steam as it comes from the mine pump is passed through an eliminator, and thence to a low-pressure turbine, which exhausts to a surface condenser. The water discharged from the mine pump is passed through this condenser on its way to the watercourse, and thus condenses the steam.



Cross-Section through Power House Using Pump Exhaust

By this means a source of energy which goes to waste in considerable quantity around many coal mines is turned to a useful end. In the particular case which is illustrated herewith, approximately 200 kw. of power is secured from steam which hitherto had gone to waste. The only live steam required is that necessary to operate the condenser pump, which is shown placed under the condenser. There is of course an overhead charge owing to the investment in the necessary low-pressure turbine and generator, together with a slight amount of extra piping. The motive power, however, costs practically nothing.

Kentucky Mining Institute Meeting

The Kentucky Mining Institute will hold its fourth annual meeting at Pineville, Ky., on May 14 and 15. The tentative program is as follows: Friday morning, starting at 7 o'clock, trip to the mines in the vicinity of Pineville, going as far as Benham and returning by way of Coxton, Ky., where lunch will be served by K. U. Meguire, of the Harlan Coal Co., reaching Pineville at 4 p.m. Friday evening, at 7 o'clock sharp, the banquet will be held. Saturday morning at 8:30, business meeting and consideration of papers; Saturday afternoon at 2 o'clock, first-aid meet with prizes, amounting to over $400; Saturday night, consideration of papers.

COMING MEETINGS

International Railway Fuel Association will hold its annual meeting at Chicago, May 17-20. Secretary, C. G. Hall, 922 McCormick Bldg., Chicago, Ill.

Rocky Mountain Coal Mining Institute will hold its next meeting in Trinidad, Colo., June 8, 9 and 10. Secretary, F. W. Whiteside, Denver, Colo.

West Virginia Mining Institute will hold its summer meeting at Wheeling, W. Va., June 15 and 16. Secretary, E. N. Zern, Morgantown, W. Va.

The American Society of Mechanical Engineers will hold its summer meeting at Buffalo, N. Y., June 22-25, 1915. Secretary, Calvin W. Rice, 29 W. 39th St., New York City.

The Illinois Mining Institute will hold its next meeting at Danville, Ill., May 27-29, 1915. The officers of the Institute are: President, J. W. Starks, Georgetown, Ill.; first vice-president, William Burton, Herrin, Ill.; second vice-president, Fred C. Pfahler, Belleville, Ill.; secretary and treasurer, Martin Bolt, Springfield, Ill.

The Kentucky Mining Institute will hold its summer meeting at Pineville, Ky., May 14 and 15, 1915. Secretary-treasurer, Ivan P. Tashof, Lexington, Ky.

The American Institute of Electrical Engineers will hold its annual convention June 29 to July 2, 1915, inclusive, at Deer Park, Md. Headquarters will be at the Deer Park Hotel. Secretary, F. L. Hutchinson, New York.

The Coal Operators of West Virginia under the auspices of the Norfolk & Western operators, in conjunction with the U. S. Bureau of Mines and the Huntington Chamber of Commerce, will hold a state-wide first-aid and mine-rescue field meet and contest in Huntington, W. Va., May 14, 1915.

Recent Legal Decisions

Company's Liability for Malicious Prosecution—A coal company is liable in damages for malicious prosecution instituted against a person by its superintendent acting in the line of the corporation's business affairs. (West Virginia Supreme Court of Appeals, Lyons vs. Davy-Pocahontas Coal Co., 84 Southeastern Reporter 744.)

Validity of Ohio Anti-Screen Law—The Ohio law which provides that where miners' compensation is based upon tonnage of coal mined they must be paid according to the total of all coal contained in the mine car in which it has been removed from the mine, except that no greater percentage of dirt and impurities shall be contained therein than that ascertained to be unavoidable by the State Industrial Commission, whose orders are subject to review, and except that operators and miners may agree upon a docking system, is not invalid as violating the constitutional guaranty of freedom of contract, but is a valid exercise of the state's police power. (United States Supreme Court, Rail & River Coal Co. vs. Yaple, 35 Supreme Court Reporter 359.)

Equipment of Coal Cars—Under the laws of Alabama a coal operator is liable for injury to a miner resulting as a direct consequence of the operator's failure to equip cars with safety appliances to prevent their running away and down into a mine to the peril of miners. (Alabama Supreme Court, Setzer vs. Burnwell Coal Co., 67 Southern Reporter 604.)

Some Large Steam Pumps

The art of building direct-acting steam pumps for mine service might appear to the casual observer to be making but slow progress. The type of these machines now built and installed closely parallels, if not exactly duplicates, the units constructed 5 to 10 years ago.

The direct-acting duplex pump has always been the steam-driven machine most favored for use in draining American coal mines. This is probably due to the fact that the space available underground places a limit upon the dimensions of the subterranean pumping engine. This limit of height, length and breadth was for the majority of cases reached some years ago. Today if greater pumping capacity is required, it is in many cases, more economical to install several units than one extremely large pump.

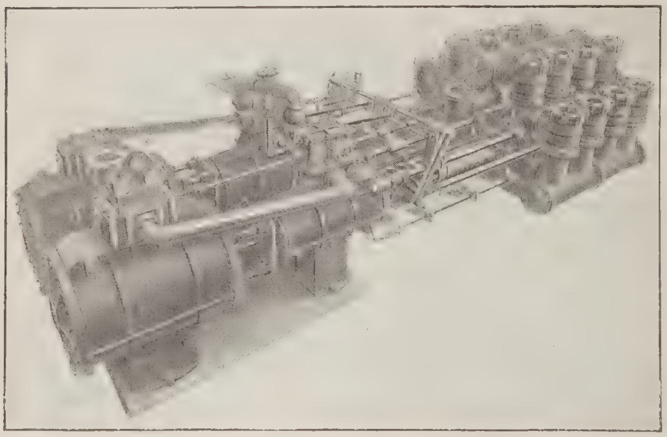


Fig. 1. General View of Pump

The Goyne Steam Pump Co., of Ashland, Penn., is at present building two duplex direct-acting compound steam pumps of large size. One of these units is for the Mid-Valley Coal Co., and is an exact duplicate of a pump built some seven years ago and will be installed in a continuation of the original pump-room. The size of this machine is 23&39x14x48 in. The condenser employed will be a 12x18x18-in. single-cylinder machine of the spray type.

This pump differs from the other that will be installed in the Mary D. colliery only in the size of the steam end. This is due to a slight difference in the head against which the two machines will act and to the conditions of steam pressure.

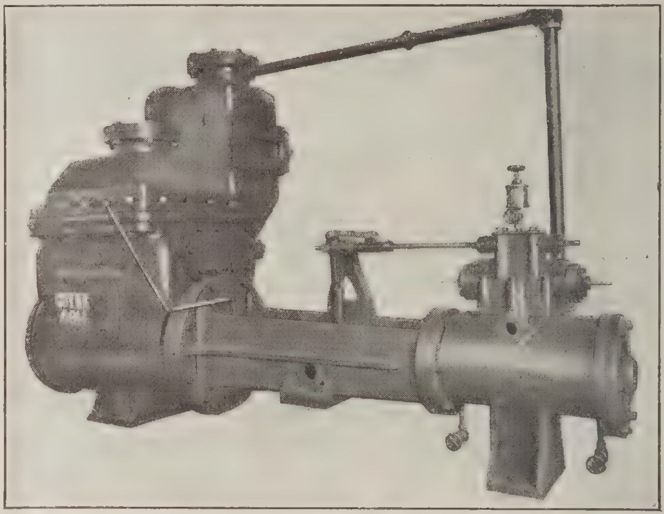

Fig. 3. The Condenser Employed

The accompanying illustrations show the pump that will be installed in the Mary D. colliery and the condenser to which exhaust will be made. The size of the pump is 24&42x14x48 in. It will be located about 1200 ft. from the boiler-house and will handle 2500 gal. per min. against a vertical head of 620 ft.

The steam end of the pump is of Goyne standard compound type, the high-pressure cylinders equipped with the Goyne cutoff attachment, which effects a considerable saving of steam, while at the same time permitting the pump to operate at a higher piston speed than would otherwise be obtainable.

The water end of the pump, which is of the 16-valve-chamber type, is protected from the action of acidulous mine-water in its entirety. The entire water end is designed especially for wood lining, and all the castings, except the division plates between the working barrels, form true circles, into which are accurately fitted staves of seasoned white pine. The division plates are protected from the action of the water by having

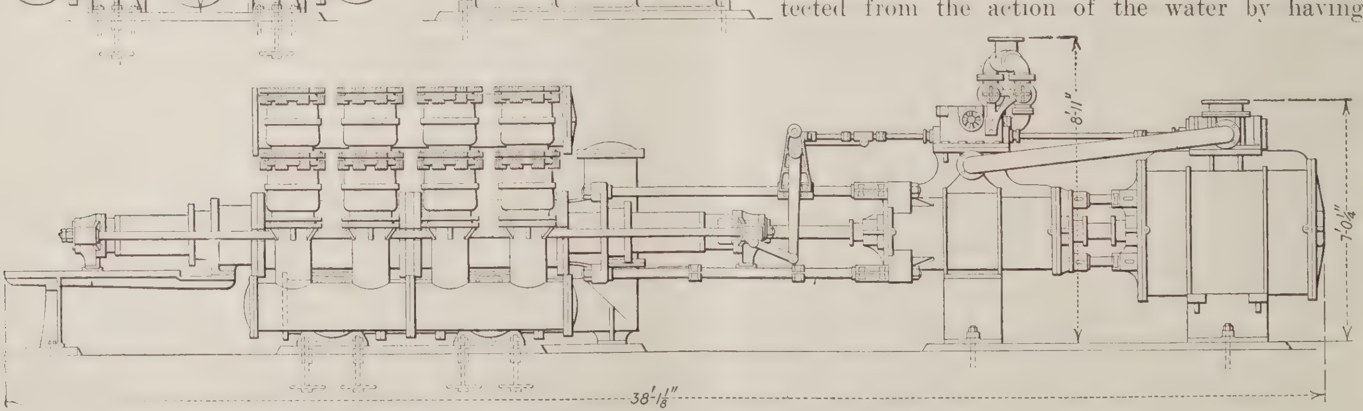

Fig. 2. Side and End Views of the Pump

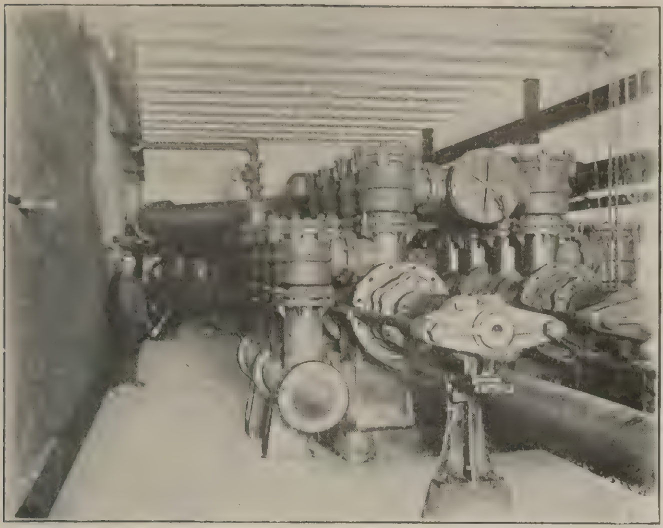

FIG. 4. PUMP INSTALLATION AT EXETER COLLIERY, 600 FT. UNDERGROUND

their faces covered with a special acid-resisting alloy. All packing-box throats are thoroughly protected by heavy machined bronze bushings which are tightly forced into place.

The condenser employed is of a heavy pattern spray type designed especially to cope with acidulous mine-water. It is full bronze fitted throughout. This condenser avoids the delicate mechanism sometimes found in machines for this purpose, and therefore reduces the upkeep to a minimum.

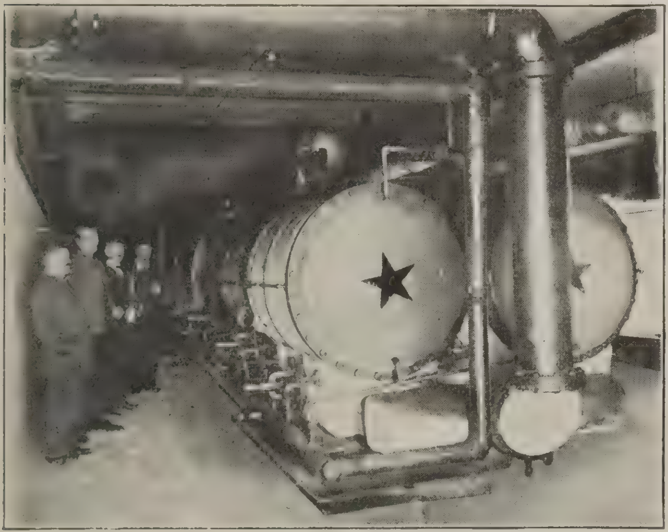

FIG. 5. ANOTHER VIEW OF THE GOYNE PUMP AT EXETER COLLIERY

⁂

March Anthracite Shipments

The shipment of anthracite during March was 4,985,398 tons as compared with 5,164,703 tons in March, 1914, a decrease of 219,305 tons, but the tonnage of the Lehigh & New England was not given by the Bureau of Anthracite Statistics. The amount of coal on hand at tidewater shipping ports increased 91,117 tons, from 782,581 tons on Feb. 28 to 873,698 tons on Mar. 31.

The Philadelphia & Reading led for the month with 961,415 tons, the Lehigh Valley was second with 894,031 tons and the Lackawanna was third with 644,932 tons. The Delaware & Hudson carried 617,605 tons, the Erie 593,250 tons, the Central of New Jersey 578,322 tons, the Pennsylvania 544,023 tons and the New York, Ontario & Western 151,820 tons.

⁂

Itinerary of Bureau of Mines Rescue Cars

CAR NO. 8

Glenalum, W. Va., Mar. 23 to Mar. 28.
Thacker, W. Va., Mar. 29 to Apr. 7.
Redjacket, W. Va., Apr. 8 to Apr. 18.
Williamson, W. Va., Apr. 19 to Apr. 29.
Chattaroy, W. Va., Apr. 30 to May 9.
Huntington, W. Va., May 10 to May 15.

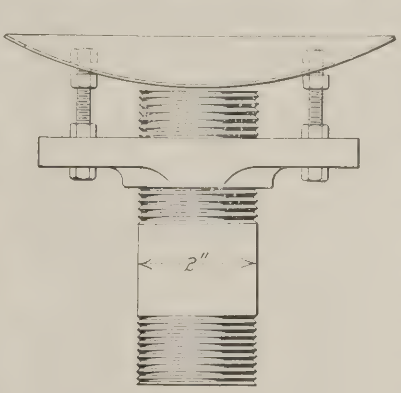
CAR NO. 6

Yatesboro, Penn., Apr. 17 to May 1.
Soldier, Penn., May 1 to May 8.
Wishaw, Penn., May 8 to May 15.

⁂

New Sprinkler System for Coal Breakers

Sprinkler systems which can be turned on by hand from outside the building have been installed in 14 of the wooden anthracite-breakers of the Lehigh Valley Coal Co., Wilkes-Barre, Penn. Tests of these systems before a committee of the Underwriters' Association of Pennsylvania have resulted in a substantial reduction in the high rate of coal-breaker insurance now in force, for breakers thus equipped.



SPECIAL SPRAY-HEAD

The new sprinkler system consists of pipes spaced 10 or 15 ft. apart and equipped with nozzles pointing upward which dash water against convex or flat metal plates fastened to the feed pipes as shown. The water is thus diffused. About one hundred 2-in. nozzles are required to protect a large breaker. The nozzles are fed by 2-in. pipes, leading from various sizes of water mains.

The new system supplements, but does not replace, the regular fire-fighting apparatus installed in every breaker, such as hose, standpipes, fire-pails, sand-pails, water-barrels and hand-grenades. When the system is operated, the interior is filled with a steady downpour of water, similar to a heavy rainstorm. At such a time it is possible for men to enter the structure and attack the fire with the regular fire-fighting apparatus, the spray system being independent of the regular apparatus. Without such a system, it is almost impossible to enter a breaker which has caught fire; the conflagration is quick and hot, because of the numerous drafts throughout the immense structure.—From *Engineering News.*

The ring system of steam piping is a thing of the past and should never be used. It involves unnecessary expense, mechanical complications, increased losses through radiation, increased danger from water collection and water hammer and it does not afford the additional security to the supply which is supposed to justify its adoption.

The Labor Situation

SYNOPSIS—Workingmen at the Nesquehoning colliery claimed the right to quit work at 3 p.m. instead of at 4 p.m., the time specified by the Lehigh Coal & Navigation Co. The umpire denied the miners' contention. In the Walsh-Rockefeller controversy the former charges that the latter has misrepresented the relation in which he stood to the management of the Colorado Fuel & Iron Co. and declares that the letters of Governor Ammons were written by Rockefeller agents. In southeastern Ohio attempts at mediation continue.

George Gray, one of the umpires of the Anthracite Conciliation Board, has decided against certain classes of workmen employed in the Nesquehoning colliery of the Lehigh Coal & Navigation Co. They contended that they ought to be permitted to quit work at 3 p.m. instead of at 4 p.m. The decision of the umpire was that the agreement in 1909 fixed 4 p.m. as quitting time and the miners could not claim exemption from this provision.

"Miners" Are Men Who Work in a Mine

It was decided on Apr. 19 that the word "miner" in the state mining law was broad enough to cover all the 160 candidates for mine foremen and assistant mine foremen in Schuylkill County whose certification had been held up by process of injunction because the men had not actually shot coal for five years at the face.

The court says that all employees working in the mine may receive certificates if they are otherwise qualified. The mine workers are given three weeks in which to file an appeal to the Supreme Court from the decision of the Dauphin County Court. Until that time the injunction restraining the Department of Mines from granting the certificates is still in force.

The Manners and Morals of Committeemen

The United States Commission on Industrial Relations is about to resume sessions in Washington, D. C., and Frank P. Walsh, the chairman, is again telling the public in advance what he expects to prove.

When we remember that the President appointed a labor agitator and a man who might well be regarded as a neutral, Hywell Davies, to decide the rights and wrongs of the eastern Ohio situation and then held up the report for several weeks in order to help a final settlement, we are surprised at the contrast in this instance. Here the chairman of the commission, because he is the friend of a party in the controversy, instead of trying to conciliate matters, gives out his conclusions before the whole evidence is presented and in such a provocative manner that it is well calculated to prevent harmonious relations.

What Committeemen Should Not Do

Government commissions need to learn something from the courts. Their decisions should not be subject to presidential demurrers and certainly not to presidential correction, neither should they state their conclusions prior to the completion of the investigation on which their judgment is supposed to be based. Men like Senator Martine and F. J. Walsh, who have both conducted commissions as means of advancing political propaganda, should be brought sharply to task.

The pulpit in the church, the class-room of the Sunday School and the rostrums of Cooper Union and Carnegie Hall are places to be avoided by those whose work is judicial. They are no places in which to discuss conclusions before the inquiry is completed. The manners of government investigators need regulation. The action of Senator Martine should be a crime punishable by impeachment and that of Frank S. Walsh should be gently corrected by fine and imprisonment, wholly without regard to the truth or falsehood of their conclusions. It must be conceded, however, that the offenses of these commissioners have been against the ethics of their profession rather than against the law.

Walsh Says that Rockefeller Wrote Letters for Ammons

Mr. Walsh declares that John D. Rockefeller, Jr., actually directed the action of his subordinates throughout the Colorado strike and did not leave matters so unreservedly in their hands as he testified on the stand. He says John D. Rockefeller, Jr., "presumed to dictate letters that were sent out to the President of the United States and to the governors of the States over the signature of the Governor of Colorado."

The first categorical denial came from Governor Ammons. Rockefeller's final reply was more detailed and therefore appeared later, on Apr. 25. He stated that Governor Ammons sent Major E. J. Boughton, adjutant-general of Colorado, in May of last year to New York City. Mr. Rockefeller says in his letter:

> I never met Major Boughton, but he told Mr. Lee, of the Rockefeller office, that Governor Ammons had been much disturbed over the misunderstanding which prevailed in the Eastern States concerning many phases of the Colorado strike.
>
> Major Boughton asked Mr. Lee if he had in mind any effective way of getting the facts before the public, and he suggested that a letter be written by Governor Ammons to the President of the United States and to the governors of other states setting forth the situation as Governor Ammons saw it. Major Boughton stated that he could not tell how the Governor would regard such a suggestion and that even Major Boughton himself would have to convey the suggestion through General Chase, Major Boughton's superior officer. To get the matter into shape for consideration Major Boughton asked Mr. Lee to make his suggestion concrete by preparing a draft of the kind of letter which he had in mind. As a basis for the preparation of this draft Major Boughton sent Mr. Lee a memorandum of his own views of the situation.
>
> The memorandum written by me and referred to in one of my letters as having been sent by me to Mr. Lee was nothing more than a rough draft of a statement concerning the Colorado situation which I had drawn up in answer to statements which had appeared in the press, but which had never been used.
>
> This memorandum was incomplete and only suggestive. When I learned of Mr. Lee's suggestion to Major Boughton, it occurred to me that this memorandum contained material which Mr. Lee might find helpful in that connection. Mr. Lee drafted his ideas and sent them to Major Boughton, but they were never even submitted to General Chase, let alone to the Governor. From Governor Ammons' statement in the mining papers it is obvious that he never knew that such a suggestion had been made.

Rockefeller Did Not Plan to Buy Up Newspapers

Mr. Rockefeller denies that he at any time ventured to direct the action of his subordinates relative to the strike situation and says that the correspondence secured by the commission in response to the subpoena duces tecum proves only that he did not influence their action. He denies another charge that he had a plan to publish a string of daily papers. A man Mr. Rockefeller had never even heard of wrote to Mr. Lee suggesting such a course, and Mr. Rockefeller declares that the only excuse Mr. Walsh has for his charges is that Mr. Lee referred to this letter in his correspondence with Mr. Rockefeller.

Nor is it true that Mr. Rockefeller had a plan of financing the official organ of the National Chamber of Commerce. This publication is known as "The Nation's Business" and is distributed without charge to the members of the Chamber of Commerce of the United States. Mr. Rockefeller states that the president of that body applied to him for his support for the paper on various occasions, and though he thought the proposition legitimate he never acted favorably on it.

Another statement to the effect that Mr. Bowers praised Mr. Murphy for not giving information regarding the Colorado Fuel & Iron Co. to Ethelbert Stewart, the representative of the Department of Labor, is denied, and Mr. Rockefeller further denies that Mr. Stewart asked for any information whatever.

Mr. Walsh expects to call Mr. Rockefeller, Mother Jones and several other persons connected with the Colorado troubles. On Apr. 28 Mr. Walsh made a reply to Mr. Rockefeller which had but one effect—that of substantiating the force of Mr. Rockefeller's argument.

There May Soon Be Peace in Eastern Ohio

The principal event in the eastern Ohio strike situation during the past week was the effort of Governor Willis to bring about an agreement. He undertook the role of mediator and called a conference of miners and operators at Canton, Apr. 24. He spoke at length to both sides urging a settlement. While it was presumed that he had a plan, he frankly said he had none, although he believed that an adjustment could be reached. Governor Willis was accompanied by J. M. Roan, chief deputy of the Industrial Commission of Ohio and the safety commissioner of mines, who took a part in the meeting.

After the talk from the Governor each side met separately and named members of the joint scale committee. The operators' representatives consist of W. R. Woodford, H. E. Willard, C. E. Maurer, R. L. Wildermuth, Joseph Pursglove, S. H. Robbins and G. M. Jones. The miners' representatives are J. P. White, national president of the United Mine Workers of America; Lee Hall, Charles J. Albasin, Fritz Fraetz, Charles Fischer, Jerome Watson and William Somerville. After organizing, the joint scale committee immediately adjourned to meet in Cleveland at 10 a.m., Apr. 27.

Dangers of Mining According to Methods Favored by Union

One of the features of the session at Cleveland was the attendance of the mine superintendents to discuss methods of safety in mining and the conservation of the coal supply. Mining with wide rooms and a road up the center as now practiced is not conducive either to the safety of the men or the conservation of the coal supply.

The meeting at Cleveland in the Hollenden Hotel really appears on going to press to be likely to result in an agreement. The miners' representatives still hold firm to the 47c. rate, to which they are irrevocably pledged. But they see that concessions must be made in every other direction, and it is rumored that they are willing to reduce allowances for rock handling and brushing to such an extent that the price of run-of-mine machine-mined coal at 42c., with the present allowances, would be practically equivalent to 47c. with those allowances modified as suggested.

C. E. Maurer, of the Glen's Run Coal Co., the chairman of the preliminary conference of operators, mine superintendents and bosses, is said to have remarked, "I believe this is the first time the miners have met us with the definite idea of making a contract."

Baird Halberstadt's Anniversary Party

On Saturday, Apr. 24, Capt. Baird Halberstadt, geologist and coal-mining man of Pottsville, Penn., invited a number of his friends to join him in a little celebration, marking one-third of a century's service in the field of geology and mining. The whole affair was unique in its character and brought together a notable assemblage of American scientists. Admiral Robert E. Peary was the guest of honor, while geologists and coal-mining men from far and near made up the remainder of the party.

Captain Baird Halberstadt

Captain Halberstadt has long desired to show his co-workers in the field of geology the wonders of the coal formations in the southern anthracite field, and he selected this anniversary occasion as a suitable time for such a reunion. Mr. Halberstadt's guests arrived in Pottsville Friday evening, at which time where was an informal reception at the Pottsville Club. Early Saturday morning the entire party left Pottsville in automobiles, which carried them through the various nearby coal-mining towns. Special attention was paid to the large stripping operations of the Philadelphia & Reading Coal & Iron Co. It was in these open-cut pits that the visiting geologists had their best opportunity to study the peculiarities of the coal measures.

W. J. Richards, president of the Philadelphia & Reading Coal & Iron Co. and a close friend of Captain Halberstadt, arranged a most interesting and instructive mining program for the visitors. During the morning, after inspecting the Bear Run stripping of the Reading company, the party was entertained by the Reading rescue corps, which gave a demonstration of first-aid and rescue work. Draeger apparatus was used. The Reading company was one of the pioneers in this kind of work in the United States, and the thoroughness with which their first-aid men do their work indicates plainly the long and careful instruction they have received.

Shortly after this the party arrived at the Maple Hill colliery, where a luncheon was served. Many of the visitors went down into the Maple Hill mine and were shown the methods of practical anthracite mining. In the afternoon, on the return trip to Pottsville, the Pine Knot colliery was visited, and the party was shown one of the newest and most modern power and hoisting plants in the anthracite field. It was especially noted by all that Mr. Richards' mines are models of order.

Saturday evening, again at the Pottsville Club, Captain Halberstadt entertained all his friends at a dinner commencing at 9 o'clock. The party was a merry one, and the after-dinner speeches were given in a vein of humor that kept the assemblage greatly amused until past the midnight hour. There were no dull moments for anyone, and few men were ever so highly honored, or so sincerely appreciated for their real worth as was Baird Halberstadt on Saturday evening. Captain Halberstadt has worked with industry and intelligence and to prove it the following met to pay their respects:

Rear Admiral Robert E. Peary, George Otis Smith, Marius R. Campbell, Prof. Frank Knowlton, Prof. George H. Ashley, Dr. Alfred H. Brooks, Dr. W. C. Mendenhall, Frank Sutton, Edward W. Parker, Charles Enzian, Prof. Henry Kummel, Prof. Thomas L. Watson, Dr. I. C. White, Dr. Edward B. Mathews, Prof. Frank De Wolf, Prof. H. A. Buehler, Prof. W. O. Hotchkiss, Prof. R. C. Allen, Dr. H. L. Fairchild, Dr. Gilbert Van Ingen, Dr. Charles E. Munroe, Prof. George W. Littlehales, Dr. W. R. Crane, Dr. Frederick B. Peck, Prof. Andrew S. McCreath, Prof. Bailey Willis, Capt. A. F. Lucas, Frank L. Hess, Floyd W. Parsons, Frederick W. Saward, W. J. Richards, S. D. Warriner, Edwin Ludlow, W. C. Whildin, Thomas Fisher, Morris Williams, Robert A. Quin, Frank A. Hill, John J. Tierney, E. A. Delaney, George M. Keiser, James B. Neale, William Auman, D. V. Randall, W. Corde Snyder, W. R. Reinhardt, Reese Tasker, George S. Clemens, Claude F. Lewis, William P. Smythe, Joseph H. Garner, John F. Bevan, E. E. Kaercher, George B. Hadesty, John H. Pollard, James McDonald, J. P. Jones, John Wood, Francis Critz, A. G. Blakeley, W. H. Lesser, J. P. Jennings, James Morris, J. E. Turk, R. H. Buchannon, A. E. Lehman, Edwin M. Chance, Horatio Morris, Edwin C. Luther, Arthur W. Shaefer, William A. Cochran, William S. Pugh, Charles W. Wagner, Edward Brennan, Hon. James E. Roderick, M. J. Brennan, John Curran, Herbert Kynor, William Wells, Hon. MacHenry Wilhelm, Hon. R. H. Koch, Hon. Charles N. Brumm, William S. Leib, William B. Rockwell, E. L. Herndon, Robert Allison, W. H. Stout, William H. Lewis, Harry Hunter, Col. James Archbald, Hon. F. Pierce Mortimer, Hugh Dolan, Hon. A. L. Shay, J. S. Ulmer, C. T. Brown, J. W. Fox, B. J. Smith, C. T. Mould, Dr. J. B. Rogers, Dr. L. T. Kennedy, Dr. W. C. Bowers, C. W. Unger, Dr. H. J. Herbein, James R. Williams, Frank Muehlhof, Capt. C. M. Wilhelm, Capt. S. B. Edwards, J. J. McKnight, Rev. Dr. James F. Powers, D. W. Kaercher, George M. Roads, Dr. G. H. Halberstadt, G. A. Muehlhof, Dr. A. L. Gillars, Hon. James B. Reilly, W. G. Gregory, B. S. Simonds, H. I. Silliman, A. H. Roehrig, R. C. Shearer, A. H. Tiley, George H. Steidel, Hon. C. A. Snyder, Capt. Harry Chambers, Hon. R. D. Heaton, Daniel Duffy, T. B. Van Buren, George D. Evans.

Editorials

Men and Americans Only

Some time ago the industries were run "for revenue only." In fact, if you read the incorporation articles of our companies you will see that any other purpose is wholly alien to the ends of corporations. Positively unlawful, however beneficial, are many of the modern developments. But these deviations from the strict letter of the law, these sundry engraftings of soul into organizations framed only to obey the letter of the law and to make a profit, are excused by the public, by a sort of general consent.

Not a single bold spirit has risen in the courts to test the right of the corporation to become in all respects like a man and contribute to almost anything—except of course a political party or a selling agency. And every one is pleased that the corporation has been permitted to assert its place in the sun of genial friendship and fellowship.

But so far most of the generosity exhibited by these fictitious individuals—corporations—has been confined to men and Americans only. The employees have been considered to the exclusion of the women and children dependent on them, and non-English speaking men have been too often forgotten. But this is being rectified rapidly. The schools are being bettered; the villages are cleaned; the milk is made pure; domestic science is taught, and sewing circles are established. Safety work is not now the sole end of sociological work, though it had its beginning in it.

In its sociological work the Colorado Fuel & Iron Co. has advanced far beyond the rule of "men and Americans only" and is seeking the welfare of the women and children and of the aliens as well as those who speak English. At its meet in Trinidad it expects to have a *boccia* contest for the Italians. The directors have noted that these foreigners are not playing baseball or basket-ball, but are amusing themselves with *boccia* (pronounced we believe boh-chee-ah), and so in order to enlist their interest in this absorbing game of bowls on an earthen alley it is to be made the basis for several eliminations and for a final contest at Trinidad, Colo.

The boys and girls will have their fun competing for the basket-ball award. A 100-yd. race for boys under 16, a 50-yd. dash for girls of the same age, an egg race for girls under 12, a three-legged race for boys of equal immaturity, a nail-driving contest for women and a drill for the Boy Scouts will remove the partiality with which in so many coal villages the inhabitants have been treated.

The tendency is to make welfare work general and not to take up only those parts of it which are easily performed—the work among English-speaking people for instance. The Ellsworth Collieries Co. is making earnest efforts to assist the Russians, Italians and Slavs in forming glee clubs and bands, the men arraying themselves in their native costumes. The H. C. Frick Coke Co. is showing a similar interest in these musical developments, and in the parades at Gary the foreign beneficial societies are also represented.

The narrow-minded native sees in the formation of racial societies a source of danger. They do not so appear to us, because it is always found that to avoid antagonizing any man's national, as also his religious, animosities is the surest way to make him a good citizen. The game of *boccia,* for instance, will be played whether frowned on or encouraged. If welcomed it will form a link between the Italians and their American friends. If it is merely regarded as a queer game of an alien people, the Italians will be confirmed in their exclusion from Americans for they will still continue to play it among themselves.

Seeing that corporations are permitted to spend their funds to advance the interests of their employees, the broadening of the movement to include all the workmen and every member of their families is an extremely welcome feature in recent developments. For the foreigners and the women altogether too little has been done in the past.

⁂

Why the Roof Is Usually Weak under Valleys

Dr. White, in his recently published remarks on the paper of the late lamented Frederick C. Keighley at the last meeting of the West Virginia Coal Mining Institute, stated that there is no apparent geologic reason why the roof under valleys should be less reliable than that under the hills. He added with perfect frankness, however, a comment which we might well paraphrase into the statement that facts frequently show a disturbing indifference to the arguments of the geologists.

Later, he declared that the removal of cover might have caused the percolation of water and the consequent decrease in strength. Frank Haas urged that the measures in Scotland which were mined under the sea with not over 100 ft. of cover were found to be in good condition. Consequently he did not believe that water affected the condition of the measures under valleys.

It is probable, however, that where the water is from the sea it does not have an equally solvent effect with that derived from rain or impregnated with the acids from vegetation, being already saturated with solutions and devoid of one of the best lime solvents—carbon dioxide. In many cases carbonate of lime is being deposited, and in such waters we may be sure it is not being dissolved. Furthermore, deep-sea water carries but little entrained oxygen to affect the rock binders.

Another important matter is the level of the water table. When the water rises and falls in the measures, the effect is much more severe than if it continues at any given level. In fact, total submergence is helpful rather than detrimental as one can note in mines that have been flooded with water for some 30 or 40 years. Both timber and rock are unfavorably affected by frequent changes in their water content. Dryness and immersion are neither so severe in their action as alternation and variation of those states.

There is another cause perhaps more important than those just mentioned, and that is the fact that most valleys tend to become the *loci* of small anticlinals. The overbalancing weight of the hills on soft or softened strata thickens the coal and heaves up the clays, shales and even the sandstone.

The valleys thus are subjected to creep, and it is generally found that on opening coal on the side of a valley it dips into the hill from the level at which it is first found as a fully developed bed. The wash, of course, may be seen well below the bed level, but as the hill is entered and the coal is found of the full normal thickness or even thicker it is seen to dip toward the heart of the hill. The thickness also appears to be greater at the crop for like reasons.

There is no question but geological readjustments are always taking place. The hills are settling and the floor of the valleys tilting up. The weight of a hill 200 ft. high is 16 tons per sq.ft. This is twice as much as it is permissible to put on dry clay, nearly three times as much as moderately dry clay should have to sustain and from 8 to 16 times as much as should be loaded onto soft clay. No one would think of up-ending the Washington Monument on a bed of the last-mentioned material without preparing first of all a broad base on which to rest it. So apparent is this that an architectural structure without an adequate base is considered a monstrosity. The eye instinctively condemns it as a freak and the aesthetic sense is offended accordingly.

We must never pass over the fact that the hills are in a condition of unstable equilibrium. Where shelving shores approach the coast, the floor of the sea may not be broken as in the instance of which Mr. Haas aptly reminds us. Where the measures are solid limestone and have not been weakened by percolation, they may stand the strain, as is the testimony of C. E. Krebs in relation to the coal at Steubenville under 90 feet of such cover. But where the measures are weak and subject to creep, nature will enact one of her silent revolutions by which hills and valleys tend to become level and are only prevented from fluxing, in approximation to a perfect plain, by the continued action of the eroding water. Even where the measures in valleys are strong in compression they may yet fail in tension when the clays below heave under them and thrust them upward.

Nature and nature's laws are therefore hardly in conflict. About 10 years ago the facts here suggested were the occasion of extended comment in the technical press, and there seems little reason to doubt that they explain why the roof under the valleys is more treacherous than that under the burden of the hill.

⁂

Boiler Compounds in Coal-Mine Power Plants

The primary business of a coal-mine superintendent is to mine coal. He must do this in the cheapest and most economical manner consistent with safety and the natural life of the mine. The operation and upkeep of the mechanical equipment necessary for the attainment of this end are of necessity a side issue, regarded by many superintendents as an unwelcome duty and a necessary evil.

If the feed-water employed in the boiler plant is drawn from a surface supply, as is frequently the case, it is not only apt to contain various scale-forming materials in suspension or solution, but humic acids formed by the decomposition of animal or vegetable matter. Also, if the supply comes from streams into which mine drainage is introduced free sulphuric acid in more or less quantity is almost certain to be encountered. Water from deep wells which might be regarded as of most excellent quality for household or drinking purposes is apt to contain a considerable percentage of carbonate or sulphate of lime or magnesia, the scale-forming qualities of which are well known to power-plant men. In short, the coal-mine boiler plant is subject to practically all the troubles and disorders due to feed-water which beset industrial steam plants, with a few others not ordinarily encountered elsewhere thrown in for good measure.

And possibly because of the fact that a mine manager is a man wise in the ways of mines and miners, but not versed in those of acids and the scale-forming ingredients of boiler-feed waters, the coal-mining field has always been one of the best places for the operations of the boiler-compound salesman.

Certain boiler compounds have their legitimate fields, and there exist many reputable firms regularly vending chemicals or chemical mixtures to be introduced into steam boilers for the purpose of neutralizing acids or decreasing the baleful effect of the scale-forming materials carried by the boiler-feed water. But no boiler compound in the usually accepted sense of the term was ever invented, evolved or discovered that proved in every-day use to be the panacea that many smooth-tongued and unscrupulous salesmen would lead us to believe.

In the majority of cases the boiler compounds offered for sale contain a soda-ash base with often tannic ingredients added. While the employment of such compounds may not cause trouble unless the boiler is given an overdose (in which case severe priming, or blistering, and burning of tubes may ensue), the results obtained are seldom, if ever, commensurate with those secured by treating the bad feed-water before it enters the boiler.

There are two facts which it is well to keep carefully in mind whenever a compound salesman unlimbers his artillery and expatiates volubly on the virtues of his particular brand of boiler cure-all: First, a steam boiler is a closed vessel in which it was intended that physical and not chemical changes should take place. Second, the treatment of a boiler-feed water by any chemical, either inside or outside the boiler, is a chemical process and should be under the supervision of a competent chemist. In other words, chemicals are introduced into a boiler-feed water solely for the purpose of acting upon other chemicals contained therein. Should a quantity greater than the amount necessary for this purpose be introduced the effect on the boiler and steam plant generally may be as disastrous as that resulting from the original impurities in the water. If it is impossible or impracticable to treat the water before it enters the boiler, a compound should be prepared especially for that particular water, the various ingredients and their amount being determined only after a careful analysis. Where the quality of the feed-water changes, as is frequently the case with a surface supply, the ingredients or amount of the compound employed should be varied from week to week to suit the changing conditions.

Sociological Department

Colorado Fuel & Iron Co.'s Contests

The Colorado Fuel & Iron Co. will hold a field day at Central Park, Trinidad, Las Animas County, Colo., on Aug. 14, at which members of the Fuel Department, the Colorado Supply Co. and the Colorado & Wyoming Ry. Co. in Huerfano and Las Animas Counties will be eligible to compete.

The camp doctor will certify on July 1 the names of all employees who have completed the training and who are eligible, in his judgment, to receive a first-aid certificate. The two camps in each county having the greatest number of proficient men thus certified will furnish a team for the contest. Employees already having certificates must present them to the doctor of the camp at which they are working not later than July 1, and the certificates must receive the doctor's indorsement.

The judges will be chosen from the medical staff of the Colorado Fuel & Iron Co. As said, there are two competing teams from each county, or four teams in all. The prize will be a banner for the successful team and a watch charm suitably inscribed for each member of the corps.

Baseball, Boccia and Basket-Ball

Las Animas and Huerfano County mines will hold elimination contests to select the best baseball team in each county, and these teams will contest for the prize on the field day, the award being 12 baseball uniforms with the name of the camp on the shirt. The Italians will be represented by two teams of boccia players, one from each county. A team consists of two men and the winners will receive $5 apiece.

A basket-ball contest will be held, open to the brothers, sisters, sons or daughters of employees only, the contestants being from 12 to 16 years old. The girls representing Huerfano County will line up against those of Las Animas County, and the boys from those two counties will be similarly pitted against one another. There will be a basket-ball and a pennant for each winning team. The elimination contest will be supervised by the school principals in each county, and the umpire and referee will be chosen from among the school teachers on the day of the contest.

Races, Nail Driving, Coal Shoveling and a Drill

There will be a 100-yd. footrace for men and boys over 16 years of age, another for boys under 16, and a 50-yd. dash for girls of the same age. There will be an entry from each camp in each of these races, and only the sons, daughters, sisters or brothers of employees or employees themselves may participate.

There is also an egg race for girls under 12, a fat men's race for those who weigh over 220 lb. and a three-legged race for boys under 12 years of age. The ladies will pound their fingers in a nail-driving contest, with a kitchen cabinet, a set of dishes and a washing machine as a reward for the three best wielders of the hammer. Each candidate for honors will have to drive 10 tenpenny nails with an ordinary carpenter's hammer. For this fearsome event it is announced that "first-aid teams will be in attendance."

A coal-shoveling contest in which a ton of nut or slack will be shoveled from one bin to another will be open to one representative from each camp. The Boy Scouts will drill, their efficiency being judged by a military man, and the best drill team will receive a 16x20-ft. tent and a United States flag.

A Nanaimo, B. C., Rescue Team

The accompanying illustration shows the team for mine rescue and first aid at the East Wellington Mine No. 1, of the Vancouver-Nanaimo Coal Mining Co. All the men but two have government certificates of competency. The teams meet periodically for practice in order to maintain a high standard of efficiency.

The Vancouver-Nanaimo Coal Mining Co. Mine-Rescue and First-Aid Teams 1914

Those in rear from left to right are: R. Hamilton, miner; J. Dixon, underground superintendent; C. Dikenson, miner. The men standing in a line in front of these from left to right are: J. Stewart, trainer; J. Knowles, fireboss; W. Williams, fireboss; J. McArthur, miner; R. Reid, fireboss; H. N. Freeman, manager; G. Grey, miner; G. Carson, miner; H. Hemer, master mechanic, and A. Jardine, miner. Crouching from left to right are: J. Hamilton, fireboss; J. Barton, miner; W. E. Tipton, miner; A. McNeil, fireboss, and W. Moore, overman. The patient is J. Diamond.

Operators Cannot Sell Sites for Homes

The oft-repeated charge that miners in West Virginia and other states are not home owners because the operators do not permit it has been well answered by a student of the conditions in West Virginia. He shows that in most cases the operators could not sell homes to the miners, no matter how much they might so desire. He also explains that it would be unwise for a miner to buy a home in a mining camp, even if the company were free to sell it to him.

In the first place there are but few tracts of coal land in West Virginia that are owned in fee simple by the mining companies. Nearly all real property is leased for the purpose of getting out the coal, and the corporations have no right to sell it to miners or anybody else—and they do not. But not having the right to sell, the operating companies do the best they can under the circumstances. They rent homes, and an investigation will show the house rent costs less in mining villages than anywhere else in the country.

Then again, suppose the operator could sell the miner land on which to build a house, would it be a good thing for the workman? In the mining villages there is no occupation not connected with mining, and everybody except the postmaster and the station agent works for the operating company. There is no other employer. Suppose a miner owns the place where he lives in this village, and he loses his job. How is he going to live? He will have to go elsewhere for employment, and if he cannot sell his home he must abandon it. Furthermore, if a man is not engaged in mining or some occupation connected with it he will not want to live at the mines, and as he grows old he wants a home where he can till the land around his cottage and where he is away from the scene of his years of toil.

⁂

Teach at the Y. M. C. A. both Night and Day

In spite of all that the state and the anthracite coal operators are doing to educate the 175,000 anthracite mine workers in Pennsylvania, the Wilkes-Barre Young Men's Christian Association is conducting also regular classes night and day for their benefit. The students who are on a night shift sleep until about noon and come to the school fresher than those who have worked all day and come to the school in the evenings. There are at present 94 men enrolled in the mining school of the Wilkes-Barre Y. M. C. A., and the average attendance is 60. The total enrollment in all the classes conducted by the association is 320.

The mining school has a three-year course, and there is a preparatory year for those who have no education and must begin at the bottom. During the first year of the mining school, instruction is given in arithmetic, mine gases, ventilation and mine law. The second year advances the students further in arithmetic and mine ventilation, and teaches mine surveying and more mine law. In the third year advanced mathematics are taught, mine surveying, ventilation, electricity and magnetism, mechanics and air compression and the course in mine law is completed. There are lectures on mining subjects throughout the course.

"You can always tell how the school is coming on by the look of the mines," said a mine foreman in charge of one of the classes. "When all is going well and the men are interested you find problems figured out in chalk on the sides of the mine cars and all over the doors directing the air currents below ground. Most of our men come from the Lehigh Valley, the Lehigh & Wilkes Barre and the Kingston Coal Co. Out of this class of twenty men only seven went to school after they were ten and only four after they were twelve, but some of them would stump you now in mathematics."

The mine school is conducted two days in the week, on Tuesdays and Fridays. In addition to the mining courses there are elementary classes for employed boys, a men's English class, and classes in arithmetic, algebra, geometry, grammar, spelling, penmanship, architectural drawing, mechanical drawing, elementary and advanced English for foreigners, for mail clerks and carriers, and in salesmanship and public speaking. The association has been successful in preparing a number of candidates for the Civil Service examinations.

⁂

Red Films for Danger

The New Jersey Zinc Co., Franklin Furnace, N. J., has had several moving pictures made of operations in their mines with a view to promoting safety. In this they have collaborated with the United States Bureau of Mines. The films are extremely clear and the information they impart most valuable.

They were presented on Apr. 7 before the New York Section of the American Institute of Mining Engineers at the Machinery Club, 50 Church St., New York City. One feature which received much favorable comment was the reddening of all parts of films which illustrated danger.

Thus when a drunken man comes forward to get his check at the office before going down the slope, the film illustrating the act is reddened to show to the non-English speaking foreigner the dangers of drunkenness. When a man tries to crowd into the man-skip after it has been filled to its complement, a red blush over the film visually condemns the action. When timbers are piled without crosspieces the films blush red again. The same is true when timbers are placed with nails standing up and the man who has been placing a double-set drops down on one of the upstanding points.

⁂

Coal Company Plants Fruit Trees and Truck Gardens

The Stearns Coal & Lumber Co., of Whitley County, Kentucky, is planting an orchard and will continue to set out trees until 4000 have been planted; 1000 to be apple trees, with fillers of 2400 peach trees, 200 each of pear and cherry trees and 100 plum trees. A large vineyard and an extensive area of bush fruits will be planted, J. E. Butler, general manager of the mining company, having provided a plot of 25 acres for the purpose.

G. D. Smith, of Richmond, Ky., was indirectly the originator of the movement, Mr. Butler being present at one of the farmers' institute meetings when Mr. Smith made a talk on the possibility of fruit-growing in the mountains. He has assisted Mr. Butler in his plans and has coached C. W. Broyles, of Pine Knot, on his own fruit farm near Richmond, so that the latter has been qualified for the work of preparing the ground and directing the planting and care of the trees.

The spaces between the rows will be used for a time in growing vegetables, and those which cannot be sold in the company's commissaries will be canned in a factory now to be built and equipped. There are numerous small orchards in the 70,000 acres held by the company, and Mr. Broyles will develop them.

Discussion By Readers

The Air Chamber of a Pump

In all that has been written concerning the pump and its action and the frequent mention made of the purpose of the air chamber of the pump, for maintaining a constant flow of water in the discharge or column pipe, I have never seen any mention of a point that frequently gives considerable trouble in pumping practice. I refer to what may be called the "waterlogging" of the air chamber of a pump.

As early as 1859 Joseph French, then superintendent of the Pittsburgh water-works, made the discovery that when a pump was operated under a high pressure the air in the air chamber became gradually depleted. The pump at the water-works of which Mr. French took charge had always worked badly, having a chronic pound or jar that could be felt by the tremor of the streets and buildings a block away. The plunger of the pump was 20 in. in diameter and had a 12-ft. stroke. The trouble was one of long duration. For years it had been a source of annoyance, and no one could offer a solution of the difficulty. Engineers East and West had been consulted without result.

Upon close investigation Mr. French found that the air chamber of the pump contained little or no air. This chamber was very large. He immediately set to work and installed a device to supply sufficient air to keep the chamber fully charged at the working pressure, with the result that the trouble was completely overcome. The pounding ceased and the pressure-gage indicated a steady, even pressure.

The lesson taught by this experience is that the air in the air chamber of a pump working under high pressure is more rapidly absorbed and carried away in the discharge of the pump when operating under a high than under a low pressure. The expedient adopted by Mr. French has since been followed by numerous other engineers; but few, if any, pump manufacturers pay any attention to the matter. The device consisted of putting a simple air valve in the suction pipe of the pump, which admitted sufficient air to replace that withdrawn from the air chamber by the discharge.

It has been generally supposed that the air contained in the water drawn into the pump would find its way into the air chamber and be sufficient to prevent the exhaustion of the air from that chamber that would otherwise occur. Experience, however, has shown this to be a false hope, and some means must be provided to replenish the supply of air in the air chamber, under the conditions named.

It required but a small air vent in the suction pipe to supply this need; but, strange to say, it was considered a crime in the installation of a pump to permit even the slightest leak of air into the suction pipe. Too much air admitted into the suction will certainly reduce the capacity of the pump, and it is necessary to carefully guard against this result.

A somewhat amusing incident is narrated of a Spanish engineer who, in 1766, attempted to raise water 50 ft. by means of a suction lift. The attempt naturally failed, and the engineer getting mad threw his hatchet with great force against the suction pipe. The hole cut in the pipe by the sharp hatchet admitted air to the suction, with the result that the pump caught the water and started working. The fact in this case was that the suction column was thus converted into an air lift, enough air entering the pipe to render the water column sufficiently buoyant for the atmospheric pressure to overcome the 50-ft. head. This experience has been since confirmed in numerous instances, where water has been raised by suction to a greater height than the theoretical 34 ft. at sea level. There is no advantage, however, claimed for the expedient in general pumping practice.

Directors' Visits

I can indorse what was said by Mr. Liddell, in reference to the visits of certain directors to the plants in their charge, in COAL AGE, Apr. 3, p. 612. It reminds me of some incidents that occurred on a similar visit of directors and officials to a mine, in my own experience. The results of that visit suggested to me the necessity of posting signs in various places on such occasions, "Hands Off." To make my meaning clear, I will recount briefly two or three of these incidents:

1. A few company officials recently going through the weigh-office at the noon hour discovered, as they thought, that the scales were out of balance and proceeded to remedy the supposed difficulty. The change made by the officials, however, caused considerable annoyance to the weighmaster, who found on his return that the cars were weighing heavy. On investigation he found that the average weight of empty mine cars agreed upon by the company and the union was balanced off by someone who had been meddling with the scales. He at once corrected the mistake.

2. The same noon hour one of the officials pocketed the weighsheet of the day before and carried it to the office, without the knowledge of the weighmaster, who had the habit of retaining the sheet for the previous day for checking purposes. He was compelled to borrow the checkweighman's sheet, of which he made a copy, which would have been unnecessary had the said official attended to what was his own business.

3. Inside the mine, a "brakie" in trying to avoid a runaway trip had set the brakes before starting. An official who happened to be in the mine that day and was behind the "brakie," with the best of intentions, began jerking the brakes out of the holders. Those who know how a loose brake will wabble back and forth will appreciate the trouble the "brakie" had in catching and setting the brakes again and will also know that he stood a good chance to be injured in so doing. Later he proceeded to tell the official a few things, and the burden of his remarks was "Hands off."

There is work for directors, as well as for weighmasters, "brakies" and many others about the mine. From trapperboy to president, all have their work to perform. The director cannot trap and the trapper cannot direct. When one man butts in on another man's job, it's a case of a square peg in a round hole.

Moral: Attend strictly to your own duties and do not attempt to do the work in charge of another man, until his failure to perform his part compromises your own responsibilities.

Co-operation in Coal Industry

Fearing that the editorial that appeared in Coal Age, Mar. 27, p. 547, entitled "A Lesson from Germany," may create the impression that it is the aim of the coal operators of this section to unduly inflate prices, I desire to add a few words by way of comparing our conditions in this country with those that gave rise to the formation of the Westphalian Syndicate.

Though a German by birth, I think I can say without prejudice that the German method of selling coal was far better than any existing in either England, Belgium or France, although the Belgian and French selling methods are patterned closely after the Westphalian Syndicate.

This statement is true, notwithstanding the fact that France has a very stringent antitrust law. But in some 20 years of operation by the French Coal-Owners' Association, no attacks have been made by the government, the French officials having reached the conclusion that while the methods of the syndicate were technically a violation of the law, they were actually a benefit to the community as a whole. If I recall correctly, one suit was brought against a syndicate owning the iron mines, but the case was never brought to trial.

I believe the establishment of a trade commission will ultimately solve our difficulties, and I hope this will come before the situation becomes too bad and that it will result in recommendations beneficial to the country's industries. I believe our people as a whole are gradually getting over the hysteria that has existed against the so-called trusts and that this sentiment includes every businessman and employer. I think I have been consistent when I argued for publicity and for coöperation on the part of business-men with legislators. The press can help us greatly by urging that more business-men and fewer lawyers be sent to our legislative halls, also by urging that the actual solution of problems is the duty of legislators rather than making attacks on corporations and businessmen. Legislators should realize that labor-men cannot get anything unless they get it from their employers and that employers are entitled to reasonable returns on their investments.

It is true that some corporations have taken undue advantage of their positions and have indulged in unfair treatment of their employees or their customers; but this fact alone should not condemn every business and every corporation or every official of such industries. The opinion that every employer or official of the company is dishonest and would steal from his workmen for the benefit of his company is too absurd to deserve notice, and yet this opinion prevails in the minds of many.

Our people as a whole are too ready to charge conditions to the most convenient cause, and since the people here are the government, the prevailing condition seriously interferes with true progress. I do not believe that government supervision has ever or will ever be resented, provided it is handled on proper lines. Unfortunately too many investigators are prosecutors more than impartial representatives. This statement I make from personal observation. Government officials in any capacity should not take sides with the popular phase of a question, but should study carefully the economic aspect of industrial problems.

Government supervision in Germany is very rigid, because taxes are based on the earnings of coal companies—the higher the returns the greater the income to the government. This seems a popular method in other lines of business; why should it not be well adapted to the coal business?

What coal operators generally aim for (and this is not confined to the present efforts of some Indiana and Illinois coal operators) is permission to do business on the most businesslike basis. The efforts of the individual cannot succeed as well as the efforts of combination. Individual selling means individual advertising, which is further limited by insufficient returns. Collective methods seem to solve many problems. If labor is permitted to bargain for its product on a collective scale, why should not the employers of labor have the same permission in disposing of the product of that labor? Monopolies are to be discouraged because of their possible abuse of power, but combinations should be encouraged because of the unquestioned advantages to be gained by the wise coöperation of all concerned in the industry.

Carl Scholz,
Vice-President and General Manager,
Consolidated Indiana Coal Co.

Chicago, Ill.

Following up his excellent suggestion that well-informed representatives of the mining industry should be on hand at all state and national assemblies when mining legislation is contemplated, which was made in his letter No. 3, Coal Age, Vol. 6, p. 798, Carl Scholz has sent the following open letter to the secretary of the American Mining Congress, of which he is the honored president:

> Dear Mr. Callbreath:
>
> I believe that one of the most important functions of the American Mining Congress should be to call attention to the crying need of sending better representatives to state and national legislatures. The enormous amount of bills against business generally that are introduced every year makes it especially imperative that any action we can bring about to remedy the situation should be taken and will certainly be of help, not only to mining, but to other industries as well.
>
> As Senator Lewis recently stated at the Hurley dinner, in Congress alone 1000 bills were introduced last year, of which 700 affected general interests. It seems to me the chief occupation of Congress should be to eliminate all bills except those that bear the stamp of necessity, rather than to add more to the present number. There is no question that we should have more business men and fewer lawyers in our legislative halls.
>
> CARL SCHOLZ,
> President, American Mining Congress.
>
> Chicago, Ill.

Mr. Scholz has explained clearly, Coal Age, Jan. 9, p. 93, Letter No. 18, that this suggestion is not to be taken as advocating the principle of lobbying for any purpose of exerting an undue influence on legislators, but rather and only to give information that would make lawmakers more competent to judge of mining matters from a practical standpoint.—Editor.

The Layland Mine Explosion

Letter No. 3—After reading the numerous references and comments relating to the deplorable Layland mine explosion of Mar. 2, I feel it my duty as one of the apparatus party that reached the 42 miners barricaded in the tenth-left heading of No. 3 mine to give briefly a few facts of personal knowledge of the conditions and work performed at that time. In doing this I want also to correct the mistake that has been made in many of these references in regard to the apparatus used by the rescuers. There were no helmets worn, as has been stated, but breathing apparatus was used instead.

In my experience of 27 years as a coal miner in England and in this country, which has included many mine accidents and explosions, I have never known the ill-feeling and controversy that this disaster has aroused. The miraculous escape from death of so many entombed men should rather excite feelings of the deepest gratitude to Almighty God. Instead, however, it seems that a strife has arisen as to who should receive the greatest credit.

Statements have been attributed to men who I had supposed were too big and broad-minded to argue over such a matter. I cannot feel that it would be right to keep silence and permit my comrades and myself to be accused of cowardice when we knew in our hearts we were doing everything possible to be done at the time. Men who have never worn a 42-lb. apparatus on their backs are often heard to say what they could do with the same; but men who have had the actual experience in the face of danger are never boastful of what can be accomplished.

With this preliminary, permit me to state that our party of 11 volunteers from the United States Coal & Coke Co., at Gary, W. Va., were authorized by our General Manager O'Toole to make the 300-mi. trip necessary to reach Layland and to do what we could for our fellow-miners entombed in that mine. We reached the mine the day following the explosion and worked side by side with the Bureau of Mines apparatus-men every day from Wednesday evening until Friday night, when we were withdrawn from the mine so that the air current might be reversed, as I will explain shortly. It was the following morning, Saturday, Mar. 6, that 47 men escaped from the mine alive, having barricaded themselves immediately after the explosion occurred, in a portion of the mine not yet explored.

In what I have to say I want it clearly understood that Earl A. Henry, Chief of the Department of Mines, and General Superintendent Bertolet, of the New River & Pocahontas Consolidated Coal Co., were in complete control of the rescue work, and all those who went into the mine for the purpose of rescue obeyed their orders. There were eight of us wearing breathing apparatus, and we made at least six explorations, advancing 1000 ft. ahead of the brattice-men, who were busy repairing stoppings and erecting brattices to conduct the air forward. In respect to the order in which the workings should be explored, we simply obeyed orders.

It will not be necessary to describe the work that was done in exploring the mine during the 60 hr. from the time of our arrival at the mine Wednesday afternoon to Saturday morning when the men walked out of the mine alive, further than to say that Chief Henry, Friday evening, ordered three of us, Mason, German and myself, all wearing apparatus, to explore the third-main entry as far as the sixth-left heading, a distance of 3000 ft., which was at the time the return air-course for that portion of the mine already explored, the air coming through the sixth-left entry from No. 4 mine and passing out through the main-third airway.

We obeyed this order and reported to Chief Henry and Mining Engineer James W. Paul that the air was fairly good as far as the sixth-left. It was then that Chief Henry ordered all parties out of the mine and had the fans stopped, to enable certain changes to be made so that the air could be reversed the following day, when it was proposed to explore No. 3 mine beyond the sixth-left. I am confident that this decision of Chief Henry was the means of saving the lives of the 47 men who came out of the mine the following morning.

Saturday morning, as previously stated, five men walked out of the mine from the ninth-left entry, where they had barricaded themselves after the explosion. They were met at the mine entrance by Mr. Paul, mining engineer of the Bureau of Mines. They knew nothing of the 42 men remaining in the mine, and it was in the hope of saving others, who might be similarly barricaded as these men on the tenth-left entry, that the apparatus-men were hastily summoned and sent into the mine.

There were eight of us wearing apparatus out of the 14 men who at once started into the mine to endeavor to reach the tenth-left entry, not knowing the condition of the mine beyond the ninth-left heading from which the five men had just escaped. The eight apparatus-men were as follows: German, Klier, Mason, Christian, Payne, Toshie, Kovacs and myself. German and his party were the first to reach the tenth-left, where they found a note at the switch, saying that there were 42 men alive in the tenth-left heading. A messenger was at once sent back with this word, and soon Mine Inspectors L. B. Holliday and R. B. Cobb came up and assisted to tear down the first of the two brattices which had been built across the mouth of the entry by the entombed men.

The first and then the second brattice were soon torn down, and we did all we could to help those 42 men and get them safely outside of the mine. It was a sight that I shall always remember. I know my own feelings were nothing but happiness and thankfulness that it was my good fortune to have some little part in restoring these men to their homes and families. This feeling was shared by all the men from Gary, as well as by those of the Bureau of Mines and the State Department of Mines, all of whom were devoutly thankful for having been of some little service to their fellows.

In closing, permit me to say that we cannot understand the seeming attempt that has been made to belittle the work of would-be rescuers, who asked nobody for praise or credit and desired no gold medals. May I say that it is hard for one who feels he has done his duty to have imputed to him, in the public press, cowardice or failure to do whatever was possible.

In the editorial that appeared in COAL AGE, Apr. 10, p. 645, the question seems to be implied, Why were not these 47 men discovered sooner? The same suggestion appears in a brief article, COAL AGE, Mar. 27, p. 549. Later developments, however, proved that it was an all-wise Providence that directed that these men should not be discovered until Saturday morning, when the air on the main-third entry had sufficiently cleared to make their escape possible through a distance of 3900 ft.

It would be hard indeed to say what would have been the result had the apparatus-men succeeded in reaching these barricaded men on Thursday or Friday, when the afterdamp yet filled the third-main entry. We doubt not that all would have died very shortly after the brattices that protected them were removed. The truth of this conclusion is proven by the fact that Angelo Aliprandi, who carried out the note to the main entry Thursday evening, 4:30 p.m., was overcome before he could make his way back and had to be pulled through the brattices by his comrades.

I am glad to say that Chief Henry and all his district inspectors worked tirelessly and courageously. They all seemed square, manly men, which is sufficient to disprove any adverse criticism. The rescue work following a mine disaster is a poor place to look for acts of cowardice, and the Layland mine was no exception to this rule.

I am glad to indorse the suggestion made in the Coal Age editorial, p. 645, that a suitable medal be awarded to the veteran who took charge of the 42 men, if the accounts be true, and prevailed on them to barricade themselves behind an improvised stopping and kept them brave and patient for four long dark days. Their names will go down in the annals of coal mining.

James Thirtle.

Gary, W. Va.

Electric Mine Laws

My attention was recently called to the inquiry of Fred Vinton, Coal Age, Mar. 20, p. 516, asking for an explanation of a rule in the electrical section of the bituminous mine law of Pennsylvania which reads as follows:

> For work underground, when supplied with current at a voltage higher than medium voltage, no transformer shall have a normal capacity of less than 5 kw.; nor shall a motor have a normal capacity of less than 15 b.hp.

As explained in the preamble to these rules, a "medium voltage" is understood in the law to mean any voltage over 300 and not exceeding 650 volts. The nearest commercial voltage to this requirement in electrical practice would be 2200 volts. In my opinion, there is a very good reason for limiting motors for mine use to a minimum size of 15 hp. and transformers to a minimum of 5 kw.

For example, if a smaller motor than that specified in the law is wound for 2200 volts the size of wire required would be so small that the construction would be too frail.

The same reasoning will apply to transformers. For example, a 1-kw. transformer has extremely small wire in the primary coil, and as it could readily be overloaded, the danger of a burnout is comparatively great. A 5-kw. transformer gives a wider margin for overload.

W. M. Hoen, Electrical Engineer.

East Pittsburgh, Penn.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

PUMPING FORMULAS

The formulas in common use in estimating the size, speed, capacity and power required to operate reciprocating pumps are developed from the well-known principles of mensuration. The following are the symbols employed:

H = horsepower required to operate pump;
G = water pumped or actual discharge (gal. per min.);
G_1 = theoretical capacity of pump (gal. per min.);
Q = piston or plunger displacement (cu.ft. per min.);
E = efficiency of water-end of pump;
S = piston or plunger speed (ft. per min.);
P_s = total pressure on steam piston (lb.);
P_w = total pressure on water piston or plunger (lb.);
D = diameter of steam cylinder (in.);
d = diameter of water piston or plunger (in.);
d_c = diameter of column or discharge pipe (in.);
d_s = diameter of suction pipe (in.);
p_s = unit pressure in steam cylinder (lb. per sq.in.);
p_w = unit pressure in water cylinder (lb. per sq.in.);
l = length of stroke (in.);
n = number of strokes per minute;
h = actual head or vertical lift (ft.);
h_f = friction head (ft.); . . . . . assume $f = 0.01$;
h_1 = effective head ($h + h_f + h_v$).

The most used and important of these formulas are the following, in the order of their development:

Piston or plunger speed $$S = \frac{nl}{12} \qquad (1)$$

Piston or plunger displacement, $$Q = \frac{0.7854\ d^2nl}{1728} = 0.00545\ d^2S \qquad (2)$$

Theoretical capacity, $$G_1 = \frac{1728\ Q}{231} = 0.0408\ d^2S \qquad (3)$$

Actual capacity or discharge, $$G = EG_1 = 0.0408\ Ed^2S \qquad (4)$$
(Assume E = 85 per cent.) $$G = 0.03468\ d^2S \qquad (4a)$$

Diameter of column pipe, (Assumed velocity, 400 ft.p.m.) $$d_c = \sqrt{\frac{G}{400 \times 0.0408}} = 0.25\sqrt{G} \qquad (5)$$

Diameter of suction pipe, (Assumed velocity, 200 ft. p.m.) $$d_s = \sqrt{\frac{G}{200 \times 0.0408}} = 0.35\sqrt{G} \qquad (6)$$

Diameter of piston or plunger, (Assume E = 85 per cent.) $$d = \sqrt{\frac{G}{0.0408\ ES}} = 4.95\sqrt{\frac{G}{ES}} \qquad (7)$$

Velocity in discharge pipe, (ft. per sec.) $$v = \frac{231\ G}{60 \times 12\ (0.7854\ d_c)} = 0.408\frac{G}{d_c^2} \qquad (8)$$

Velocity head, $$h_v = \frac{v^2}{2\,g} = \frac{(0.408\ G/d_c^2)^2}{2 \times 32.16} = \frac{G^2}{400\ d^4} \qquad (9)$$

Friction head, (Vertical lift) $$h_f = \frac{f\,hG^2}{8\ d_c^5} = \frac{hG^2}{800\ d_c^5} \qquad (10)$$

The Coal Age Pocket Book

Effective head, ($h_1 = h + h_f + h_v$) $$h_1 = h + \frac{G^2}{800\ d_c^4}\left(\frac{h}{d_c} + 2\right) \qquad (11)$$

Static water pressure, $$p = \frac{62.5\ h}{144} = 0.434\ h \qquad (12)$$

Working pressure, $$p_w = 0.434\ h_1 \qquad (13)$$

ESTIMATING FOR PUMPS

In pumping, the effective work of the steam-end per minute is equal to the work performed in raising the weight of water discharged each minute through a height equal to the effective head. Assuming an efficiency of 75 per cent. for the steam-end,

$$0.75\ (0.7854\ D^2)\ p_sS = \frac{62.5 \times 231}{1728}\ Gh_1$$

Again, assuming a water-end efficiency of 85 per cent.

$$0.85\ (0.7854\ d^2)\ 12\ S = 231\ G$$

Then, dividing the first of these equations by the second, member by member, it is possible to estimate the ratio of the diameter of the steam-end to that of the water-end of the pump, for a given effective head and a given steam pressure in the cylinder; thus,

Diameter ratio, $$\frac{D}{d} = 0.7\sqrt{\frac{h_1}{p_s}} \qquad (14)$$

Diameter of water-end, $$d = \sqrt{\frac{231\ G}{0.85 \times 0.7854 \times 12\ S}} = 5.37\sqrt{\frac{G}{S}} \qquad (15)$$

Diameter of steam-end, $$D = 0.7\sqrt{\frac{h_1}{p_s}} \times 5.37\sqrt{\frac{G}{S}} = 3.76\sqrt{\frac{G\,h_1}{S\,p_s}} \qquad (16)$$

Assuming, as before, an efficiency at the steam-end of 75 per cent., the horsepower required to operate a pump that will discharge G gallons of water per minute against an effective head h_1 in feet is calculated as follows:

Horsepower required, $$H = \frac{62.5 \times 231\ G\,h_1}{0.75 \times 1728 \times 33{,}000} = 0.00034\ G\,h_1 \qquad (17)$$

The steam pressure required at the throttle to operate a pump of given dimensions against a given effective head h_1 is found by transposing formula 14; thus,

Steam pressure required, $$p_s = \frac{h_1}{2}\left(\frac{d}{D}\right)^2$$

Speed of Reciprocating Pumps—It is usual pump practice to estimate on a piston speed varying from 50 to 100 ft. per min., depending on the size and style of pump and numerous other conditions relating to the head or pressure against which the pump is to operate, quantity of water to be pumped, length of stroke, etc.

In general, the smaller sizes of reciprocating pumps have naturally a shorter stroke and, although run at a higher speed (r.p.m.), have a less piston speed in feet per minute, than the larger sizes, which make a less number of strokes but have a greater piston speed.

Inquiries of General Interest

Capacity of Double-Acting Pumps

Will you kindly explain what is meant by a "double-acting" pump and what is the stroke of such a pump. Also, show how to calculate the capacity of a double-acting pump when the diameter of the plunger is 20 in. and the length of stroke 40 in., assuming the pump is running at a speed of 25 r.p.m.

PUMP-RUNNER.

Greensburg, Penn.

A double-acting pump is one that pumps water at each stroke of the piston or plunger. Water is drawn into one end of the pump barrel at the same time that the water in the other end is driven out into the discharge pipe.

The stroke of a pump is the distance through which the piston or plunger moves. A pump makes two strokes to every complete revolution of the flywheel.

As shown in the accompanying diagram, which illustrates the action of a double-acting piston pump, water enters the pump through the suction pipe *S*. As the piston moves to the right, a partial vacuum is formed in the left end of the pump barrel, and the atmospheric pressure forces the water up the suction pipe and through the valve *A*. At the same time, the water in the right end of the pump barrel is forced out through the discharge valve B_1 and passes into the discharge pipe *D*.

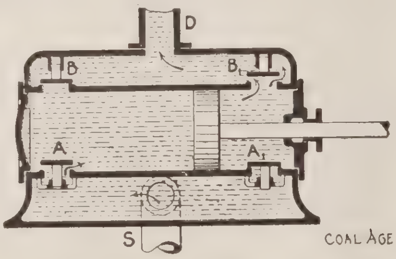

DIAGRAM OF DOUBLE-ACTING PISTON PUMP

The succeeding stroke of the piston as it moves to the left promptly closes both the suction valve *A* and the discharge valve B_1, while at the same time the suction valve A_1 and the discharge valve *B* are opened. The conditions are now reversed, and the water entering the pump through the suction pipe *S* passes through the suction valve A_1 into the right end of the pump barrel, while the water in the left end is driven out through the discharge valve *B* and passes as before into the discharge pipe *D*. The action of the pump is such as to produce a continuous discharge.

In order to find the capacity of a pump, it is necessary to calculate the piston or plunger displacement in cubic feet per minute or gallons per minute, as desired. The piston or plunger displacement is found by multiplying the sectional area of the piston or plunger by the length of stroke and that product by the number of strokes the pump makes per minute. Thus, in this case,

$$G = \frac{50 \times 40\,(0.7854 \times 20^2)}{231} = 2720 \textit{ gal. per min.}$$

It is customary to assume an efficiency of the water-end of a pump as varying from 80 to 85 per cent. In this case assuming an efficiency of 85 per cent., the actual capacity of this pump will be $0.85 \times 2720 = 2312$ gal. per min.

⁂

Two Questions on Gases

A practical miner has asked me some questions that I would be pleased to see answered in COAL AGE. They are as follows:

1. How much carbon monoxide is present in the exhaust of a gasoline mine motor when it is suddenly moved into an atmosphere containing enough carbon dioxide to seriously affect the efficiency of the engine?

I understand this question to mean the *relative* amount of carbon monoxide in such an atmosphere, as compared with the amount that would be produced in an atmosphere free from carbon dioxide.

2. What effect has gas pressure on black powder in drill holes after they have been tamped, in the interval between charging and firing?

This last question assumes that a strong gas pressure accumulates in the hole and is exerted on the powder after the hole is tamped.

PRACTICAL COAL MINER.

Springfield Ill.

The statement of the first question is quite indefinite, as no indication is given of the extent to which the efficiency of the engine is impaired; but even if it were to be assumed that the efficiency is decreased by a certain percentage, it would still be impossible to estimate how much this condition would increase the percentage of carbon monoxide in the exhaust of the engine. For these reasons the question can only be answered in a general way.

As stated in COAL AGE, Vol. 6, p. 840, the quantity of carbon monoxide produced in the cylinder of a gasoline engine will depend largely on the supply of available oxygen. Under normal running conditions, the exhaust of the engine contains about 6 per cent. of this gas, according to a statement made by O. P. Hood, Chief Mechanical Engineer of the Federal Bureau of Mines, in his paper read at the October, 1914, meeting of the American Institute of Mining Engineers. It may reasonably be assumed that a percentage of carbon dioxide in the mine air sufficient to seriously affect the efficiency of the engine would result in greatly increasing this percentage of carbon monoxide in the exhaust gases; but the amount of this increase cannot be estimated without more accurate data.

In answer to the second question, it may be stated that the gas pressure would have no effect on the black powder of the charge in the hole. However, the presence of this gas under considerable pressure would produce a very pronounced effect when that charge of powder is exploded. The explosive effect would be greatly increased by the presence of the compressed gas. Probably the greatest effect, however, would be the extension of the flame of the explosion by reason of the presence of the gas.

Examination Questions

Pennsylvania Bituminous Mine Foremen's Examination, April 6-8, 1914

(*Continued from last issue*)

Ques.—State briefly the duties of a driver, motorman, cager, triprider and miner.

Ans.—A driver in a mine is required by law to always leave his trip in a safe place where it will not endanger other drivers or get loose and do possible damage. He must so adjust the brakes or sprags as to keep his cars under complete control. He must not allow any person to ride on a loaded car and must see that every door is closed after passing through it.

It is the duty of a motorman to look after the locomotive in his charge and permit no one to handle it but himself. He must not exceed the speed permitted by the mine foreman and must sound the whistle or other alarm when approaching switches or crossings where danger to men or animals may exist. When running the locomotive he must keep a sharp lookout ahead to see that the road is clear and the track safe. He must permit no one but his attendant to ride on the locomotive. He must see that the motors, cables and controlling parts are kept clean and in safe condition and that the headlight is burning properly when running the locomotive.

The cager at the bottom of the shaft must not attempt to remove the car from the cage or put another car on until the cage comes to rest on the bottom. When placing a car on a cage he must see that the springs or other fastenings hold the car securely from moving. The cager must not allow anyone to give signals for the movement of the cage when he is in charge.

A triprider must see that all cars are properly coupled and that the ropes are in place and attached to both ends of the trip before starting the same by giving the signal. He must examine all rope connections, chains, links, etc., to see that they are in perfect condition and report any defects he may find. He must not allow any person to ride on the full trip or on an empty trip without permission of the mine foreman. He must see that the speed of the trip does not exceed 6 mi. per hr.

The miner is required by law to examine his working-place before beginning work and take down all dangerous slate or make it safe by timbering. He must examine to see that the fireboss has left his mark at the face each morning and, not finding the same, notify the mine foreman or his assistant. If his place becomes dangerous from gas or bad-roof conditions, he must cease working at once and, placing a suitable warning or danger signal across the entrance, proceed to inform the mine foreman or his assistant of the danger.

The miner is required by law to mine his coal properly before blasting and to set sprags under the coal while undercutting the same. He must examine carefully the roof and coal after firing a shot and make his place safe before starting to work. He must order what props and cap-pieces he may need, at least one day in advance. The law prohibits the use of coal dust or other combustible material for tamping. The miner is not allowed to charge or fire any shots in a place liable to generate explosive gas, except with the consent and under the supervision of the foreman, his assistant or other competent person who is duly authorized. The law requires the miner to remain in his working-place and not to leave the same to go to another working-place without permission of the mine foreman or his assistant.

Ques.—What is the area of an airway 8 ft. wide at the top, 10 ft. wide at the bottom and 7 ft. high?

Ans.—The average width of this airway is $\frac{1}{2}(8 + 10) = 9$ ft. and the sectional area of the airway is therefore $7 \times 9 = 63$ sq.ft.

Ques.—How much air is passing in the airway, in the last question, when the anemometer makes 165 r.p.m.?

Ans.—This reading of the anemometer, for all practical purposes, indicates a velocity of the air current of 165 ft. per min. The quantity of air passing in the airway is therefore $165 \times 63 = 10{,}395$ cu.ft. per min.

Ques.—What are the chief causes of mine fires and how would you proceed to guard against them?

Ans.—The chief causes of mine fires are the accidental ignition of gas blowers when blasting coal; or the ignition of fine coal and slack by spontaneous combustion in waste and abandoned places in the mine; or the use of open lights in stables, pumprooms, enginerooms and other places where hay, waste and like combustible material are used; or by the short-circuiting of electric currents, or the blowing out of fuses, or the ignition of gas by the sparking of wires. Mine fires may result from a local explosion of gas or dust at the working-face.

The best safeguards against mine fires are the prompt removal of the possible causes of fire, by loading out all fine coal and slack, the use of protected lights in stables, pumprooms, etc., and the enforcing of strict rules in reference to blasting and gas.

Ques.—The water gage being 1 in. and the volume of air in circulation 50,000 cu.ft. per min. in a certain mine, what will be the volume of air in circulation in this mine when the water gage is increased to 1.6 in., the increase being due to an increase of power on the air?

Ans.—Since the increased water gage is due to an increase of power, and not to any change in the mine airways that would cause an increased resistance, the quantity varies as the square root of the water gage. In other words, the quantity ratio is equal to the square root of the water-gage ratio. Then, calling the required quantity of air x, we have

$$\frac{x}{50{,}000} = \sqrt{\frac{1.6}{1}} = \sqrt{1.6} = 1.265$$

and $x = 50{,}000 \times 1.265 = 63{,}250$ *cu.ft. per min.*

Book Reviews

A Manual of Shaft Sinking

THE SINKING OF SHAFTS. Vol. II of Modern Practice in Mining. By R. A. S. Redmayne, Chief Inspector of Mines in Great Britain, late professor of mining, University of Birmingham. pp. xiv + 270 + 5 index; 5½x8¾ in. 172 ill., 2 being folded charts. Longmans, Green & Co., 443 Fourth Ave., New York City. Price, $2.25, cloth boards.

There is no more comprehensive and authoritative book on shaft sinking than this volume by R. A. S. Redmayne. It is well illustrated throughout, and only about two dozen of the cuts are halftones. The greater part of the illustrations are line-cuts, which involve more labor and expense to the author and publisher, but which tell their lesson so much more completely, rapidly and accurately.

A Shaft Mine with about Three Acres of Territory

Mr. Redmayne does not spend much time on the history of shaft sinking, but the following note will be found of interest:

> Up to the time of the invention of the atmospheric engine in 1810 by Thomas Newcomen, mine shafts were much limited in point of depth by reason of the difficulties in raising the water. The maximum depth attained by colliery shafts in Great Britain was about 360 ft., their diameter being seldom, if ever, more than 7 or 8 ft., and the area of coal worked by one shaft rarely exceeding a radius of 200 ft. with the shaft as a center. Fifty years later, amid great rejoicing, Walker colliery, on the banks of the Tyne, was sunk to the Main-Coal seam, at a depth of 600 ft. from the surface, a medal being struck to commemorate the event.

The Deepest Shaft

From such shallow shafts the coal industry has progressed until now there is one, the Providence shaft in Belgium, No. 18 pit, Machienne collieries, which, Mr. Redmayne states, is 3937 ft. to the bottom of the sump and which in 1908 had its lowest hoisting level at 3707 ft. Of course this depth is exceeded in several metal mines, notably the No. 5 shaft of the Tamarack copper mine in northern Michigan, which, by the way, is deeper than No. 3 shaft of the same Tamarack Mining Co., though the latter is declared by Mr. Redmayne to be the deepest in the world.

The No. 5 shaft is 28 ft. over a mile in depth, or 5308 ft. The shallower shaft reaches a depth of 5253 ft., and in the workings there is a blind slope on the dip of the bed, 800 ft. from the main shaft, which is 406 ft. long. So No. 3 shaft, though not as deep as No. 5, gives access to an even profounder depth. Apparently the Ashton Moss coal shaft in Lancashire is the deepest in England, with a depth of 2880 ft.

The author in his introduction discusses the position, shape, size and requisite number of shafts on a mining property. In the next chapter he deals with elementary methods of sinking. The third chapter discusses drilling and blasting. Then follows a description of the processes of sinking and lining shafts. Another chapter is devoted to drainage, ventilation and sinking and is followed by yet another in which the arrangements for sinking and the costs of sinking and lining are discussed at length.

Methods of Shaft Sinking

The methods described in the last two chapters are extremely interesting, though for the most part they reflect conditions far more severe than those with which we have to cope in America. The first systems described are those using wood and steel piling. In the latter the shapes used by the Interlocking Channel-Bar Co., of Chicago, and by Charles Walker, of England, are described. Here it might be pointed out that more space might have been devoted to American sheet-piling methods. The author has not given them the attention they deserve. Then follows an account of the system of Haniel & Lueg, in Düsseldorf. One of the drawings illustrating this German method we have reproduced, and it accompanies this article.

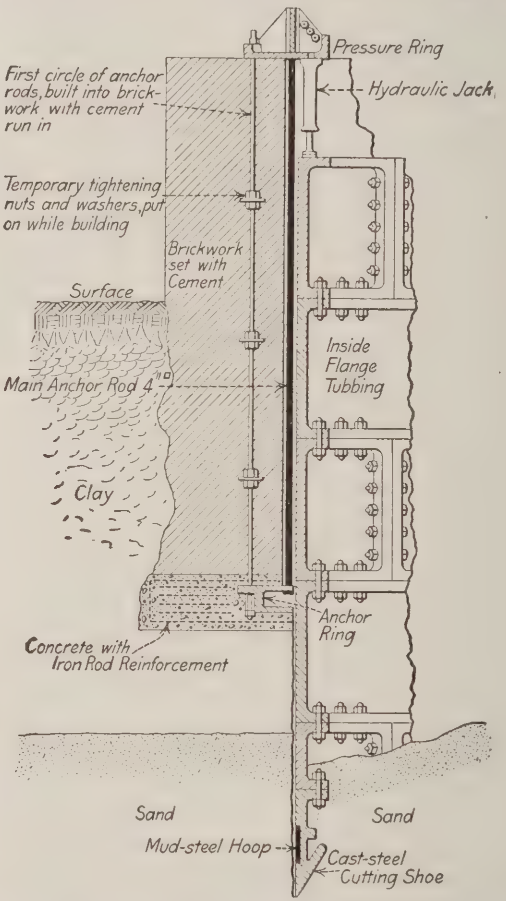
The sand shown in the lower part of the illustration lies so near the surface that it is necessary to build up the shaft with brickwork set in cement so that there may be sufficient weight against which the hydraulic jacks may be braced in pressing down the cutting shoe into the water-logged sand. The sand is removed by hand or by a clamshell bucket. In some cases a peculiar device called a sack-borer is used; this scheme though old has been greatly improved by Sassenberg & Clermont.

Sinking under Water

The Haase system uses a piling of wrought-iron tubes; the Honigmann method drills the shaft under a pressure of muddy water which prevents the sides from caving. At the same time a current of water is established in a pipe which forms the spindle of the boring tools. This water rapidly removes the sludge formed by the action of the cutting edges, and this is aided by the lifting action of air, which is discharged within the pipe mentioned. Of course this device is suited for work in quicksands only.

Some Percussive Methods

The Pattberg percussive borer is a large tool occupying the full diameter of the shaft. It cuts and crushes the soft rock. The cuttings are washed from the cutting faces by water under a pressure of about 1000 lb. per sq.in., and air, compressed to 1100 lb. per sq.in., lifts these cuttings from the shaft. The borer has a stroke of 8 to 12 in. and makes 60 to 70 strokes a minute.



Pressure Ring
First circle of anchor rods, built into brick-work with cement run in

Mud-steel Hoop
Cast-steel Cutting Shoe

HANIEL & LUEG'S SYSTEM OF ADVANCING SHAFT KNOWN AS THE SINKING-DRUM PROCESS

The well-known Kind-Chaudron method, where the rock is drilled by a giant trepan, later receives attention. It also hails from Germany. Another German device is a shaft-boring apparatus worked by intermittent hydraulic pressure called by the author "shock." There are six bits which are so operated. The pressure is switched on or off by a valve which controls all the boring bits at once. The pressure is opposed by retractive springs which lift the bits when the hydraulic pressure is relieved. The cuttings are removed by the flushing of water.

The pneumatic or compressed-air system, which might be better described as the caisson method, is also discussed. This was invented by a Frenchman over 60 years ago.

The process of preparing a shaft for sinking by cementing the measures around it was first tried in the Béthune colliery in Pas-de-Calais, now just within the British army lines. The congelation process, in which the measures are frozen, was invented by Poetsch in 1883, though the process in a modified form had been tried in Wales as far back as 1862.

The author says nothing about methods of cementing the cracks in the measures in sinking nor about the sealing of shafts by pumping cement mortar or other material into the measures around the shaft. In fact, while Mr. Redmayne shows a somewhat complete knowledge of European practice, he does not seem to be as well acquainted with American methods.

Costly Shaft Sinking

A quotation from page 2 of this volume may well conclude this review. It shows clearly how great the problem of shaft sinking is in Europe and why invention has been so greatly stimulated, especially on the Continent.

> A still more costly sinking was recently made in Belgium, where the putting down and lining of two pits through 1968½ ft. of water-bearing strata cost about $2,338,000 and a further 338 ft. in coal measures cost about $20,000, or a total cost of roughly $2,358,000—equivalent to nearly $511 per ft. sunk and lined. The full cost in sinking and equipping the colliery amounted to $3,394,000.

A book like the one we are reviewing it would not pay to write in America as the demand for it is so limited. For this reason we believe no legislation should be passed restricting the importation of foreign books. While they describe oftentimes processes of much value to a few people in America who have great need of them, a book about such methods is not of such general interest that native talent is likely to be engaged in writing it.

⁂

A Pioneer in Mine Accident Prevention

GREAT COLLIERY EXPLOSIONS AND THEIR MEANS OF PREVENTION. By W. Galloway. pp. viii + 130. 5⅝x8½ in. 24 ill. and 11 plates. The Colliery Guardian Co., Ltd., 30 and 31 Furnival St., Holborn, London, E. C., England, 1914. Paper cover.

This book being in small type contains an immense amount of information. It is a reprint of papers mostly read before British societies by the author, the first dating back to 1872. Many of these are printed here at greater length than in the societies' proceedings. The relation of Mr. Galloway to the present state of knowledge regarding mine explosions is most intimate. The industry owes him a great debt for his work.

An Article in 1872 on Explosions as a Result of Weather Conditions

The first paper discusses most completely the connection between explosions in collieries and weather, Robert H. Scott, the Director of the Meteorological Office, collaborating with him in its production.

Another paper on the same subject followed in the next year, being read before the Meteorological Society. In those days the importance of barometer and temperature readings was far greater than today, for the ventilation was either natural or only feebly assisted. Fans such as the Waddle were just beginning to be introduced. Consequently the weather conditions needed close observation.

In 1874 Mr. Galloway addressed the Royal Society on his experiments with safety lamps, some of which on the protective action of gauze dated back to early in 1872. He urged in this paper the effect of the sound wave in aiding the passing of a flame through gauze. A description of the explosion in the Llan colliery near Cardiff, reprinted from an issue of "Iron" in 1878, then follows in which the author discusses the influence of coal dust in extending explosions and even starting them if any gas is present. This article is followed by several from the "Proceedings" of the Royal Society, 1876 to 1884, on the influence of coal dust in colliery explosions.

Galloway Urged Stone-Dusting in 1896

Before the Royal Commission on Explosions from Coal Dust in Mines in 1891, Mr. Galloway urged the using of dust-tight mine cars, and in a letter addressed to the London "Daily Chronicle" in 1896 he says:

> I would suggest that the adoption of one or the other of the following alternatives be made compulsory in every dry and dusty mine: (1) All roadways along which coal is being hauled from the working-places to the shaft shall be kept damp continually, and all roadways which have ever been, but are no longer, used as haulage-roads shall have the coal dust cleared from them and be thereupon liberally coated all over with fine dried clay dust. (2) All roadways which are, or ever have been, used for the purpose of hauling coal shall be coated with dried clay dust throughout their entire length and a similar coating shall be applied from time to time at regular stated intervals to all roadways which continue to be used as haulage-roads.

We are unable to understand why this book was published. A reprint is never so satisfactory as a new and uptodate statement of facts. If it is a defense of Mr. Galloway's work as a pioneer it largely fails to produce the right effect, because the author merely reprints his papers without any statement relative to their originality or to the opposition they aroused.

Anyone at all well acquainted with the chronological history of mining will realize, however, that Mr. Galloway has been in the forefront for many years and is one of the original thinkers among the many which the mining profession of Great Britain has produced.

⁂

An Institute Issues Its Proceedings Monthly

WEST VIRGINIA COAL MINING INSTITUTE BULLETIN.—E. N. Zern, editor, Morgantown, W. Va. pp. 40. 6x9 in., 2 ill. Paper cover. Monthly issue.

We welcome a new child to the large family of coal-mining publications. The mining industry will surely "not be ashamed when it meets its enemy in the gate" with such a bunch of healthy children if this last born is a fair sample of the others.

The editor under the head, "A Patient, a Prescription and a Plea," most aptly describes the reason why the bulletin was started. It was founded as a last resort when the institute support failed, as has happened all too frequently in other states of recent years. Some of us who believe it takes a little fortune to start a paper of course are not convinced that it is a job for a deficit to tackle, and some of the editors of this paper and of other state institutes are going to put E. N. Zern on the "unfair" list for undertaking to publish a bulletin on the pittance of a state institute editor, especially to venture with such a compensation to put such a generous amount of care and good will into his work.

Is the Survey of West Virginia to Be Discontinued?

In the columns of this new periodical, Dr. I. C. White discusses the work of the State Geological Survey and deplores the fact that the necessary funds for its continuance may not be received from the state. Nineteen counties out of 55 are not yet surveyed geologically, and one-fourth of the whole area of the state has not been mapped topographically. As Dr. White says, "It is simply inconceivable that the legislature should stop the survey permanently and thus commit such a great injustice to the 13 counties of the state which have borne their share of the cost of making the 36 completed 'detailed county surveys' and of the topographic surveys in the 40 completed counties."

Tribute to Fred Keighley

"Stray Currents" is a series of short editorials ending with a tribute to Frederick C. Keighley, of Uniontown, Penn. Those who knew him—and few there were in Pennsylvania and West Virginia who did not—recognize the justice of the statement, "He was a leader in thought, progressive in action, a light to the industry and an inspiration to all favored with his friendship."

Two papers from the December meeting follow—one by Richard Smethurst on "Cost and General Accounting" and one by Frederick C. Keighley on "A Contemplated Method of Meeting the Difficulties Encountered in Mining Coal under Friable Roof in Connection with a Very Soft Floor or Bottom."

The "Ring of Steel" Around West Virginia

A cartoon originated by Wightman D. Roberts and drawn by M. B. Aleshire, a Huntington cartoonist on the Chicago "Tribune," shows West Virginia surrounded by enemies in Ohio and Pennsylvania. Mr. Roberts has great respect for the preparedness of his rivals, depicting them with a large mortar, a big armored motor car, protected with a Red Cross flag, many shells and an aëroplane. The West Virginians are taken entirely unprepared and are seen sitting on benches. They have only Mother Jones, a hound and much gas at 5c. per thousand cubic feet wherewith to asphyxiate their opponents. The "Bulletin," we suspect, is not neutral. When we see the genial smiles on the faces of the Pennsylvania coal operators we really believe that trouble may yet be averted.

⁂

It is the custom at many collieries, as pointed out by A. Mitton Dury in a paper before the Manchester Geological & Mining Society, to drive ahead narrow roads for prospecting. Blowers of gas often discharge in such narrow roads, and this gas may be distributed along the course of the workings to points where shots are being fired. Mr. Dury asks if it would not be wise to provide that, where a road is not in use at any time, it shall be kept entirely free from gas or be so built off that no dangerous quantities can escape.

Coal and Coke News

Harrisburg, Penn.

The Senate, on Apr. 21, passed finally the Catlin Bill No. 160 to bring anthracite miners under the proposed workman's Compensation Act. The final effort of the operators was to amend the bill regarding the definition of a miner, it being their contention that the bill, as finally amended on Apr. 20, was by far too severe.

According to the bill the term "miner" means the person who cuts or blasts coal or rock at the face of a gangway, airway, breast, pillar or other working place. The operators wanted this definition to include also any person engaged to do general work in a mine and qualified to do the work of a miner.

Another thing fought for by the coal companies was to keep the new act from becoming operative until Jan. 1, 1916.

The bill now goes to the House where the miners do not anticipate any serious trouble, for in the past this body has always been favorable to the miners, and the Senate, the pit in which all mining bills perished.

The Catlin bill accomplishes the following for anthracite workers.

1. Makes the mine operators responsible for injury to a workman if the injury is caused by the negligence of the mine foreman, assistant mine foreman or any person in charge of the mine or any part thereof. This places the mine operator in the same position as all other employers with respect to liability.
2. The anthracite coal miners go under the workmen's compensation law, if such law is enacted.
3. The word "miner" is positively defined.
4. An adult member of the family of a man killed in the mines has the right to examine witnesses at a coroner's inquest and counsel for the family also has the right and may explain the law to the coroner's jury.
5. None others than miners will be allowed to fire blasts.

Amount and Distribution of Coal Tax Still Indefinite

Nothing definite resulted at the conference of the representatives from the anthracite counties with the Ways and Means Committee, with respect to the amount and distribution of the tonnage tax, as covered by the Dawson bill, but there were several important developments.

One is that the Governor is standing by his proposition to have the distribution 60 per cent. to the state and 40 percent. to the anthracite counties.

The other is that it has not been decided whether the amount of tax under the Dawson bill shall be 2½ or 3½ per cent. ad valorem.

The committee also gave a hearing to the operators to protest against any increase in the anthracite tonnage tax levy, and incidentally to bear witness that the Roney Act of 1913 is a burden.

One of the most remarkable arguments on behalf of the coal companies was made by W. H. Williams, vice-president of the Delaware & Hudson Co. of New York. He emphasized these points. That in spite of the immense dividends, the Lackawanna Coal Co. is earning only 4½ per cent. on its capitalization; that the coal companies have not increased the price of coal during the past 10 years, that the approaching termination of the miners' agreement will mean increased costs in production, and finally, that the legislature will impose upon consumers of coal an increased price of 10 cents merely by the enactment of the workmen's compensation bill.

Mr. Williams' explanations of the slim earnings, in spite of the occasional melon cut in Wall Street, was that this company was able to pay large dividends for the reason that money earned in previous years had not been expended, and the surplus has always been large. The Hudson company is paying taxes on $20,000,000 worth of property, when its capitalization is $43,000,000, but this capitalization, he said, included some railroad property.

Major Everett Warren, James H. Torrey and Ex-Judge Frank Wheaton presented arguments to show that the imposition of the tonnage tax is a burden which is causing lessees of coal land actually to lose money, as in many cases the coal royalties paid do not overbalance the anthracite tax, amounting to 7 cents a ton.

Mr. Torrey insisted that the coal companies are being over burdened, the Hudson company, he said, is earning less than 6 per cent. and now the Catlin bill will make the operators liable for damages for injury to the workmen, and the operation of such an act would increase the cost of coal 10 cents a ton. This statement is made in contradiction to the assertion of the Attorney General at a hearing some time ago that the compensation cost could be met by one cent a ton increase.

It was also brought out that coal company taxes had jumped five times in 10 years.

Vice-President Williams of the Hudson company said that while in 1902 the cost of production advanced 17 per cent. by reason of the strike, and that in 1912 another increase amounted to 7 per cent., the price of coal remained stationary at tidewater. The smaller sizes of coal are sold, he said, for less than the cost of production. Companies are selling less steam sizes than three years ago because of competition with bituminous coal and coke and that at the present time anthracite conditions are chaotic. "We have stored 236,000 tons of coal in the winter months," he said significantly. "The wage agreement with the miners comes up next year and we must protect ourselves against a strike."

One of the reasons for hard times in this country, Major Warren says, is the anthracite tonnage tax. The retailers say they find lessened opportunity to sell anthracite, people shake their grates less frequently and the result is a decreased production. "The companies I represent mined 1,000,000 tons less in one month as compared with a year ago. At the ground of all assaults upon anthracite companies is the increased price. We are charging too much. You add a tonnage tax. The result is a lessened production."

Commission to Investigate Rise in Coal Prices

Senator Vare has introduced a joint resolution, providing for a commission to investigate and report on the increased cost of anthracite coal alleged to be due to the tax imposed in 1913, which reads as follows:

Whereas . . . An act laying a tax on anthracite coal and providing for the collection and distribution of the same, the tax or two and one-half per cent. was imposed upon the value when prepared for market of every ton of anthracite coal which said tax did not on the average exceed five cents per ton and

Whereas, The operators of the anthracite coal mines, although refusing except in a few isolated instances to pay tax or any part thereof and although contesting the validity thereof in the courts, and it having been stated publicly in the press of the state and not denied that they have combined either among themselves or with retailers to raise the price of anthracite coal and did actually raise said price 25 cents per ton, upon the pretense, that the said amount was for the purpose of paying said tax, therefore:

Be it enacted, etc. That a commission of three be appointed by the Governor to serve without compensation to investigate the cause of causes of the rise of said price of anthracite coal, either by operators of anchracite mines or dealers in anthracite coal, whether the same was justified or not, and whether the same was done as a result of any illegal combination or confederation upon the part of the operators of anthracite coal mines or dealers in anthracite coal, and investigate and report all other facts and circumstances in reference thereto, said commission to report to the Governor on the first of January, 1916, and make a further report to the Governor and to the Legislature on the first day of January 1917.

For the purpose of enabling said commission to carry out and perform its duties, the said commission shall have the right to sit in any part of this Commonwealth and shall have power to compel the attendance of witnesses and the production of books, papers and other evidence at the meeting of the commission and for that purpose may issue subpoenas signed by the president of the commission and cause the same to be served and executed in any court of the Commonwealth and if any witness refuses to testify any fact within his knowledge or to produce any books or papers within his possession or under his control, the secretary of the commission shall forthwith report the facts and of such refusal to the court of Common Pleas of the county wherein such witness resides or wherein his attendance was required and all questions arising upon such refusal shall at once be heard by said court. If the court determines that the testimony or evidence required by such witness is legal and properly competent and ought to be given or produced by him, then said county shall make an order commanding such witness to testify or produce books or papers or both as the case may be and if such witness shall thereafter refuse to testify or produce books or papers as aforesaid in disobedience of such order of the court, then the said court shall have the power to order the commitment of such witness to the county jail of the proper county for contempt.

The sum of $10,000 is appropriated for the expenses of the commission.

The bill to bring clay, ore and graphite mines and stone, slate, marble and granite quarries of the state under the supervision of the Department of Mines, and to be inspected by the various mine inspectors has been so amended, that the real purpose of the bill is killed. Section 1 reads as follows: "That on and after the passage of this act the clay quarries or mines of Pennsylvania in which bituminous coal is also mined shall be operated under the supervision of the State Department of Mines and shall be subject to such rules and methods of operation as may be recommended by the Chief of the Department of Mines in accordance with such provisions of the coal mine laws of the state as may be found applicable to the supervision of clay quarries or mines." The words ore and graphite mines and stone, slate, marble and granite have been stricken out.

The bill creating a Division of Boiler Inspection in the Department of Labor, and regulating the inspection of steam boilers has been so amended that Section 4 of this bill, now reads "Provided, That nothing in this section shall refer to boilers in cities of the first, second and third class and in those counties for which special laws have been enacted for the inspection of steam boilers and boilers in use at or in connection with coal mines.

Concerning Stream Pollution

Senator Crow has introduced a bill to amend Section 16 of the Act of May 1, 1909, which will no doubt be closely watched by bituminous interests, as several suits have been started by state fish wardens against coal operators in the western part of the state for violations of this act. The amended section is as follows: "That it shall be unlawful for any person to put or place in any waters within the Commonwealth any electricity or any explosive or poisonous substances whatsoever or any drug or any poison bait for the purpose of catching, taking, killing or injuring fish or to allow dye stuff, coal or gas tar, coal oil, sawdust, tan, etc., to be turned into or allowed to run, flow, wash or to be emptied into any of the waters aforesaid, unless it is shown to the satisfaction of the commissioner of fisheries or the court that every reasonable and practical means have been used to prevent pollution of waters in question, by the escape of deleterious substances. In the case of the pollution of waters by substances known to be injurious to fishes or to fish food, it shall not be necessary to prove that such substances have actually caused the death of any particular fish. Provided that nothing in this section shall prohibit the use of explosives for engineering purposes when a written permit has been given therefor by the proper national, state or municipal government and Provided further, That nothing in this act shall apply to waters pumped or flowing from coal mines into waters within the Commonwealth."

PENNSYLVANIA

Anthracite

Sugar Notch—Alarmed at the rapid spread of forest fires in this vicinity, Burgess John Riley issued a call on Apr. 21 to the citizens asking them to organize fire fighting forces to battle with the flames that threaten to destroy much valuable timber and probably damage the town. Two collieries operated by the Lehigh & Wilkes-Barre Coal Co. were in danger. They furnish employment for practically every male resident of the borough. Officials of the collieries called the employees to the workings and instead of sending them to their work inside the mines, organized the men and boys into fire-fighting brigades.

Wilkes-Barre—Examination of men who desire to qualify as candidates for mine inspectorships in Luzerne and Carbon Counties was conducted in the Court House on Apr. 20, 21 and 22. Twenty men took the examinations. The terms of all the mine inspectors expire this year and all are taking the examination. The candidates include the seven present inspectors, nine mine foremen, two miners, one former mine inspector and one assistant mine foreman. The Board of Mine Inspectors' Examiners who held the examination were John J. Hanlon, chairman, Patrick Dougherty and Daniel J. Bolton, practical miners; E. R. Pettebone and A. B. Jessup, mining engineers.

Tamaqua—During the year 1913 the Alliance Coal Co. operating the Kaska colliery near Middleport encountered a number of hindrances to the operation. Facing these conditions the operation was closed on Dec. 24, 1913. For several months the force of outside employees was kept cleaning up and shipping material to other collieries, the pumps were finally withdrawn and the shaft allowed to fill with water. This colliery adjoins the profitable and busy Silver Creek operation of the Reading company and since pumping has stopped, the latter colliery has felt the effects of the water from Kaska in some degree. In order to safeguard the men from possible drowning should the water break the barrier pillars between the two mines, the Reading company has a force of men drilling proving holes in the third level of Silver Creek shaft, to ascertain the exact thickness of the veins which lie between them and the water stored in the Kaska shaft. The presence of officials of the interested companies making tests at the abandoned shaft caused the loosing of a number of unfounded rumors concerning the early resumption of the place. Contrary to printed reports none of the former employees have been asked to report and the watchmen are the only men about the plant.

Pottsville—Owing to the extraordinary dry weather considerable areas of woodland are being swept by fires, which are in a number of instances getting into proximity to large culm piles. Some of these contain many thousands of tons of combustible material. The state police are aiding in fighting these fires.

Bituminous

Connellsville—The production of Connellsville coke recently amounted to 298,000 tons per week, while shipments were at the rate of 295,000 tons. The number of active merchant ovens were increased by 200 and better running time has been made in those in operation, the result being an increase in production of approximately 5000 tons per week.

Pittsburgh—The stages of the three rivers recently reached the lowest point recorded in more than 50 years for this season, and Pittsburgh coal operators with 4,000,000 bu. of coal awaiting shipment were facing a situation almost unprecedented in the history of western Pennsylvania water traffic. It is seldom that shipping on the river has been interrupted by low water before July 1, for longer than a week or so at a time. No coal has left the Pittsburgh harbor since Feb. 20. As a result barges have accumulated until more than 500 are tied up in this vicinity at the present time. It is estimated that it will require 25 tows to remove the coal now lying in the local harbor.

Tarentum—The tipple, brickmaking plant and boiler house of the Cornell Coal Co., near here were recently damaged by fire to the extent of $15,000. This fire originated in the boiler house. The mine will be shut down for a few days until temporary repairs can be made.

Brownsville—E. S. DeArmit, division superintendent of the Knob Albany and Chamouni Mines of the Monongahela Consolidated Coal & Coke Co., and Joseph Barshotti were instantly killed in the Knob mine, Apr. 21, when 30 ft. of solid rock fell upon and buried them. DeArmit, Barshotti and Richard McKenna were inspecting rails in the mine. McKenna narrowly escaped being buried with the other two men.

Irwin—The University of Pittsburgh evening course in the principles of coal mining, conducted by Robert M. Black, assistant professor of mining, closed on Apr. 21. This course is the second years' work in the program in the University extension outlined by the School of Mines. Those receiving certificates of proficiency were William H. Evans, Albert H. Jones, John W. Luteman, Joseph W. Rymer, and James M Stein.

West Virginia

Clarksburg—The Consolidation Coal Co. recently began shipments of coal to the Lakes. This trade will increase the output for some time at least. Only those mines operated before the trade started will be run; it being the intention to increase the daily output of these operations.

Charlestown—The Crown Hill mines of the National Bituminous Coal & Coke Co. were sold at auction Apr. 22, to satisfy a judgment obtained by the heirs of the Hasford estate upon which the mine is situated. But two bids were offered and the property was sold for $1800. At the time of the purchase by the National Bituminous Coal & Coke Co., the consideration named in the transaction was $60,000.

Grafton—The loading record of the Monongah Division of the Baltimore & Ohio R.R. was recently the largest that it has been in any single day since last summer. The number of cars loaded of all commodities amounted to 1368, the largest previous record was 1605, which was made during the rush of business last year. Eleven hundred and thirty-five cars of coal and coke entered into the 1368 of the recent record, the remainder being various commodities with lumber in the majority. Cars are being rushed into the district to insure an ample supply to carry the increased shipments, and the railroad company anticipates no difficulty in handling the business, no matter how much increase it may show.

Fairmont—The Baltimore & Ohio R.R. recently put the Underwood night train and crew to work to haul empty and loaded cars to and from the Jamison mines. The opening of the Lake trade and the demand for coal made this necessary. About 110 cars is the average being loaded at the

Jamison mines at the present time—the normal loading capacity being 140.

An extra train and crew have also been put on the Chiefton run at night. About 145 cars are being loaded daily on this run and two train crews are kept busy day and night handling the traffic.

Another indication of the resumption of business activities in the Fairmont region was the order recently issued by Manager H. H. Watson for the resumption of full time at the shaft mines of the Consolidation Coal Co. This plant when working to normal capacity gives employment to over 300 men and was practically closed down last fall when orders for coal ceased to come in. The Lake season is now open and with orders plentiful this mine as well as others now operating will devote its coal to Western shipments.

VIRGINIA

Bristol—Due to a drought in the southwest Virginia mountains, coal mines and mining plants have been threatened by forest fires for some time. These fires have made such progress as to require the efforts of hundreds of miners to protect the mines and plants at the Inman operations near Appalachia and also at the plants of the Stonega Coal & Coke Co. at Stonega, the Virginia Lee mines in Lee County and other mining operations in their vicinity. The Stonega Coal & Coke Co. is said to have lost considerable timber while its plants have been protected only by determined efforts.

Appalachia—Four hundred miners on Apr. 20 escaped from a fire which started in the Inman mines Nos. 1 and 2, owned by the Virginia Coal & Coke Co. Mine inspectors reported this escape was due to improved facilities.

TENNESSEE

Knoxville—Optimistic reports of committees featured in the quarterly meeting of the Southern Appalachian Coal Operators' Association recently held in this city. Each of the reports showed that business was becoming much better and indications were that a prosperous year is ahead. Operators representing all parts of the Appalachian region were present and discussed the improved conditions in their respective territories.

KENTUCKY

Pineville—Sale of the lease and property of the Luke & Drummond Coal Co. in Bell County has been ordered in the case of H. W. Sanford and others against the coal company by the United States Court in which the suit has been tried. The sale will be conducted by L. C. Gunter, receiver. The company has a lease of 1600 acres and a well equipped plant.

A feature of the fourth annual meeting of the Kentucky Mining Institute, which will be held here on May 14 and 15, will be a state wide first aid meet, which the committee in charge is endeavoring to make the most interesting of all similar contests ever held in Kentucky. A large number of valuable prizes have been offered for the winners and it is expected that the American Mine Safety Association will announce a schedule of medals to be awarded. All over the state, according to reports received here, rescue teams are drilling in preparation for the contest and the various events promise to be hard fought. Numbers of papers on important topics will be read and trips will be arranged to the mines in the vicinity of Pineville.

Fleming—There has been a marked increase in tonnage for the mines of the Elk Horn Mining Corporation and everything points to a gradual resumption of work at all mines in the near future. The company is working full time and is increasing tonnage as fast as it can get the men necessary to do so.

Barbourville—The coal mining industry in southeastern Kentucky seems to be on the eve of a revival after a temporary shutdown. Operators in Harlan, Bell, Knox and Whitley counties report an increasing business with large orders from points of consumption. Mines have not yet resumed full time but orders on hand insure a steadier run than there has been for several months past.

OHIO

Columbus—Failing to secure favorable action on his bill to fix maximum freight rates on coal in Ohio, Senator Vorheis has introduced in the Ohio Legislature a joint resolution calling upon the State Utilities Commission to immediately investigate intrastate rates on coal. The resolution states that the leadership of the state in the coal-mining industry is being imperiled by alleged discriminatory rates on coal shipments. It is believed there will be no substantial objection to this joint resolution in either house.

INDIANA

Clinton—The J. K. Dering Coal Co., of this city, has just distributed to the mine bosses, stable bosses, weigh bosses and other heads of departments prizes amounting to $1000, for efficiency in their departments. The prizes ranged from $15 to $100.

Indianapolis—Delegates representing coal operators who mine about 80% of the coal output of Indiana visited Washington, Apr. 20, seeking permission to establish a selling agency to handle their entire output. The committee made its representations to the Federal Trade Commission and later conferred with one of the assistants to the Attorney-General of the United States and the Department of Justice officer who is in charge of trust prosecutions. The coal operators said they desired to avoid violating the Sherman anti-trust law. They said they wished simply to reduce the cost of marketing their output; that there is now much cut-throat competition. It is said the federal officials intimated that the coal companies might be permitted to effect a limited combination for purposes of conservation. The delegation represented 114 mining companies whose properties are valued at $30,000,000.

ILLINOIS

Taylorville—The Mammoth mine of the Christian County Coal Co., located near Taylorville, was sold Apr. 20, to the Peabody interests of Chicago, owners of a number of coal mines in central and southern Illinois. The price paid was $185,000; $50,000 being in cash and a mortgage given for the balance. This mine was sunk in 1900; the company owning it being incorporated for $100,000. It is said that dividends to the amount of $190,000 have been earned; $90,000 of which have been paid back into the company in acquiring new coal rights and in making repairs.

Pawnee—Many coal miners in this section are seeking work on farms; they believe that the local mines will resume operations in the fall, and hope to keep employed between now and that time.

Canton—Following close upon the suspension of activities at the Maplewood mine No. 2, at Farmington, came the announcement that the Simmons mine, north of Canton, would close indefinitely. This makes the third mine in this section that has closed down recently, the mine at Norris being the first.

MINNESOTA

Virginia—H. O. Johnson recently returned from a trip to Mentor, Polk County, where he started the first drill at work in that section, exploring what is believed to be a bituminous coal field of considerable extent. Mr. Johnson believes there is no question about the Polk County coal field, and thinks that large measures exist there of a good grade of bituminous coal. It is also claimed that anthracite has been found. It is believed that these deposits at Mentor are distinct from the lignite beds in the northwestern section of the state.

COLORADO

Trinidad—The selection of a jury to try John R. Lawson, international board member of the United Mine Workers of America, charged with the murder of John Nimmo, a mine guard, on Oct. 25, 1913, began in the District Court here, Apr. 21. Talesmen were examined by Attorneys H. N. Hawkins for the defense and Deputy Attorney General Norton Montgomery for the state.

UTAH

Price—The coal and coke trade of Carbon County is steadily improving as is evidenced by the fact that 600 ovens out of about 700 are going at full capacity at Sunnyside, while the reserve coke stored at that plant and amounting to several thousand tons is now exhausted. Considerable coal for railroad use on the east end of the Denver & Rio Grande is also coming from Sunnyside while something like a dozen cars a day goes to the gas and commercial coke plants at Salt Lake City. It is believed that the mines and coke ovens will be kept going fairly steadily throughout the entire summer. At present five days per week are being worked, with the prospect that this will soon be increased to seven.

PERSONALS

J. B. McClary was recently reëlected president and general manager of the Yolande Coal & Coke Co. No changes were made in the organization of this firm at the election.

Samuel Dixon who for 35 years was a resident of Fayette County, W. Va., being identified with several of the large coal operations, is making arrangements to return to this county. He is to be at the head of a sales agency, handling the output of the Deegans interests. Mr. Dixon will also handle a couple of Loup Creek operations.

C. H. King has been appointed general agent of the coal and ore department of the New York Central lines with headquarters in Pittsburgh. Mr. King succeeds M. D. Flanigan who resigned to enter other business.

Alexander Thompson, aged 71 years, foreman for the Pennsylvania Coal Co. at No. 4 shaft, is critically ill of pneumonia in St. Frances' Hospital, San Francisco. He was stricken while on a pleasure trip to the West, incidentally the first vacation he had taken in his 50 years' work for the company. He is president of the City Planning Commission of Pittston.

Neil Robinson, of Charleston, W. Va., who was a few weeks ago appointed temporary receiver for the LaFollette Iron Co., was recently appointed by the Federal Court of Knoxville, Tenn., permanent receiver for this company, with Daniel D. Carter, cashier of the East Tennessee National Bank of Knoxville, as co-receiver. The furnace of this company at LaFollette is still being operated. Mr. Robinson is also receiver for the LaFollette Coal, Iron & Ry. Co.

OBITUARY

Francis S. Lambie, 48 years of age and a coal operator of Clarksburg, W. Va., died at his home recently. He is survived by his widow, two sons, and one daughter.

A severe attack of pneumonia caused the recent death at his home in Allentown, Penn., of William C. Walters, connected with the Lehigh Valley Coal Sales Co. Mr. Walters, who was 40 years old, entered the employ of the coal company at an early age, and never severed his connection with it, being promoted to the local office some years ago.

George Vaux, who in his earlier years was secretary and treasurer of the Swatara Coal Co. which carried on extensive operations in the Lykens Valley regions prior to the sale of its coal lands to the Philadelphia & Reading Coal & Iron Co., recently died at Bryn Mawr at the age of 83 years. Mr. Vaux was recognized as the highest authority on the history of the Society of Friends in and near Philadelphia.

Alexander Law, mine foreman for the Pennsylvania Coal Co. at the No. 8 Colliery, died suddenly, Apr. 22, at his residence in Pittston, Penn. He was the son of William Law, one of the pioneer mine superintendents in the anthracite coal field. Either heart failure or the bursting of a blood vessel is believed to have been the cause of his sudden death. Mr. Law is survived by his wife and three children, also three sisters and one brother.

INDUSTRIAL NEWS

Cincinnati, Ohio—Goodin, Reid & Co. recently purchased the entire plant and has the exclusive use of the patent rights of the American Rubberfelt Co. of Chicago. It is operating the plant in Cincinnati.

New York, N. Y.—M. N. MacLaren, New York manager of the Nordberg Mfg. Co., of Milwaukee, Wis., announces the removal on Apr. 26, 1915, of the New York Office from 42 Broadway to offices in the new Equitable Bldg., 120 Broadway.

Columbus, Ohio—The general offices of the Toledo & Ohio Central and the Kanawha & Michigan railroads have been moved from Toledo, Ohio, and Charleston, W. Va., respectively, to the New York Central Building on East Gay St., Columbus.

Washington, D. C.—Assistant Secretary of the Treasury Newton on Apr. 21 awarded the contract for the mechanical equipment for the Laboratory Building of the Bureau of Mines at Pittsburgh, to the Standard Engineering Co. of that city. The contract was for $63,650.

Charleston, W. Va.—Just half as many corporations doing business in West Virginia were dissolved or surrendered their charters as were newly incorporated during the month of March. Sixty-six new charters were issued during March, 55 to resident and 11 to non-resident companies. Thirty-three withdrew from the state by one process or another. Twelve corporations increased their capital stock and 14 decreased it.

Bluefield, W. Va.—Eight large electric locomotives have been placed in service on the Norfolk & Western Ry. to be used in handling heavy coal trains over Bluestone mountain. The motors displace about 40 steam locomotives formerly used for this work, and thus accomplish a considerable economy. Preparations are now under way for the complete electrification of the division, in order to enable coal traffic to be handled exclusively by these large motors.

Charlestown, W. Va.—The shipments of coal and coke over the lines of the Chesapeake & Ohio Ry., during the month of February, and for the first two months of the year, show that 1,404,177 tons were shipped during February as compared with 1,187,833 tons during the same months of 1914. This is an increase of 216,344 tons. During the first two months of the year a total of 3,106,224 tons were shipped as against 2,867,284 tons during the corresponding period of the previous year. This is an increase of 238,940 tons.

Fairmont, W. Va.—The Consolidation Coal Co. recently let a contract for the sinking of two shafts in the Helen's Run field. One will be sunk by the Dravo Contracting Co. of Pittsburgh, and the other by H. S. Stark of Greensburg, Penn. The shafts will be 520 ft. in depth and will cost $50,000 each. They will have an annual capacity of 750,000 tons. The contractors will start work immediately. Western Maryland R.R. Co. engineers are surveying for the new railroad to market the coal from these shafts.

Buffalo, N. Y.—The Buffalo shipping trestle of the Delaware, Lackawanna & Western R.R., which had been ordered closed by the government as an obstruction to navigation, was lately taken entirely out of the possession of the company. A third order has now been issued, permitting its use till a new shipping station can be built, when the present trestle will be removed and the mouth of Buffalo River widened 60 ft. at that point. It is expected that the company will build a car dump on the new water frontage of the yard.

Cincinnati, Ohio—A. A. Kramer, attorney for the Marmet Coal Co. of W. Va., now in the hands of receivers, recently confirmed the report of a sale of the $2,000,000 West Virginia and Ohio coal properties and steamboats of the Marmet Co. to a $35,000,000 Eastern coal syndicate, subject to the confirmation of the courts of West Virginia and of Cincinnati. The new owners intend mining operations on large proportions, also marketing the product of additional West Virginia mines, particularly in Central and Northwestern territory.

Cincinnati, Ohio—A course of six lectures, for the especial benefit of engineers, and firemen at industrial plants, and all others interested, is announced by the University of Cincinnati, to be extended over a period of some months. These lectures deal with proper methods of firing stationary boilers. The course was decided upon after conference with a committee of local stationary engineers. Analysis of coal, the theory of combustion, losses in boiler plants due to improper firing, various types of furnaces in use, and other subjects of practical value will be dealt with in the course.

Charleston, W. Va.—The statement of the shipments of coal and coke over the lines of the Norfolk & Western R.R., during the month of March, and for the first three months of the year, shows a decrease as compared with the shipping during the same period of last year. During the month of March 1,975,876 tons were shipped, as compared with 2,215,188 tons in the same month of 1914. This is a decrease of 239,312 tons. For the first three months of the year, a total of 5,622,635 tons were shipped as compared with 6,062,091 tons during the corresponding period of the previous year, or a decrease of 439,356 tons.

Birmingham, Ala.—The changes in the organization of the Woodward Iron Co., which were unofficially announced and promptly denied a few weeks ago, were recently effected in New York. The position of chairman of the board was created and A. H. Woodward was elected chairman from the position of vice-president and general manager. J. H. Woodward retains the position of president, while the underofficial takes the chairmanship. R. H. Bannister was made vice-president to succeed A. H. Woodward. D. E. Wilson was elected treasurer, and Herbert Smith, assistant secretary. The office of secretary is unfilled.

Toledo, Ohio—The Cincinnati, Hamilton & Dayton R.R. recently gave its new docks and coal hoisting machine its first tryout, in loading the steamer "John P. Reiss" with coal for up-Lake shipment. The new machine is one of the largest on the Lake and one of three now in use, the others being at Sandusky and Cleveland. Its capacity is forty 75-ton cars, or forty-seven 50-ton cars of coal per hour. The height of the machine is 90 ft. and its length 60 ft. 1 in. Contractors began the removal of the old coal-hoisting machine on Nov. 28, 1914, and the new dock was completed and the new machine installed and ready for use on Apr. 15. The improvements cost $350,000.

Coal Trade Reviews

General Review

April anthracite business fair but lacking the usual snap that marks the opening period. Bituminous situation mixed. Heavy increase in export business. Adverse outlook in the Lake trade.

The April business in anthracite has been fairly satisfactory, and the month has closed with a good many orders still unfilled. While the circular has been generally well maintained, prices are not very strong, and the April market was notably lacking in the customary snap and rush that characterizes the lowest price period of the year. An extraordinary heavy tonnage of Lake coal has started for the Northwest since the opening of navigation, due to heavy loading on vessels through the winter. Though agencies are not granting direct concessions on circular prices, they are occasionally holding forth inducements in the shape of long-term credits. The indications point to a slowing up in hard coal before the current month is out.

The Eastern bituminous situation continues decidedly mixed. There has been no well defined turn for the better, though inquiries seem more plentiful, and most agencies express more satisfaction with the outlook, but there are others that are of the opinion that the best that can be anticipaed is a mild spurt in the fall which cannot possibly be of sufficient proportion to compensate for the extremely dull year.

One of the most hopeful features at the moment has been the rapid broadening out of the export market, and there are conservative observers who believe that we are on the verge of a tremendous expansion in this trade. Accumulations at a number of the Tidewater ports are substantially reduced, and the movement at some points may establish new high records. Another sharp advance in ocean freights may prove a restraining influence in the export market, but it has developed that many British vessels on this side are not returning to home ports because of the fear of being requisitioned for Government service, and this should help the situation some.

Demand in the Pittsburgh district is slightly better, some of the steel manufacturers taking practically full requirements, but supplies continue excessive, and prices have not recovered. Conservative interests will not admit of any improvements while prices continue so low and the demand light. The beginning of iron ore shipments down the Lakes only serves to emphasize the adverse conditions prevailing in the Lake trade; in fact, it now seems possible that many of the Upper Lakes companies will find their supplies adequate without placing any more orders. Ohio consumers continue purchasing in the open market, and while the opening of navigation has stimulated interest to some extent, the situation is still generally discouraging.

The Middlewestern market is well sustained, considering the general dullness. The agencies are concentrating their efforts on maintaining prices, and an improvement in the demand is anticipated shortly. A few important contracts are being signed up, but at rather low figures. Interest for the time being is centered on slack coal, which is generally in short supply in all directions. Mine operations are down to the summer basis, some mines having been closed down entirely.

BUSINESS OPINIONS

Financial Chronicle—Never was there greater need for care and caution and for the exercise of wholesome restraint. A rising stock market and speculative fervor do not call for the application of repressive measures if sound sense and reasoning can be adduced in support of the same. Within such limits, advancing stock prices mean a revival of hope, and this, in turn, means a revival of energy throughout the length and breadth of the land.

Dun's—The developments of the week have served to strengthen the influences working for improvement, and business confidence further increases. The volume of trade is expanding, although the movement, taken as a whole, is not rapid, and wide differences exist, some industries working overtime, largely by reason of big war orders, others reaching a fairly normal capacity, while others still struggle with adverse conditions. Excellent reports come from the dry goods markets, in which increasing confidence and expansion are noted.

Bradstreet's—Trade continues to expand, progress is of a cumulative character, and even concededly slow lines are evincing a more lively disposition. In fact, the general situation, trade and industrial, seems to be moving on to new and higher ground. Faith in the future is more firmly rooted, and though buying of merchandise is devoid of speculative aspects, the tendency to cover distant prospective wants is rather marked, with sellers in certain textile lines assuming an independent attitude. Reports as to growing crops are flattering.

Boston News Bureau—Every day sentiment the country over shows signs of betterment. Merchants who have benefited comparatively little by the war begin to see an increased demand for their special goods. There is more disposition to do business and this comes from a gradual but steady return of confidence. Big profits have been corralled on war orders. Enormous money has been made in stock specialties. The higher security values make people generally feel better. There is, therefore, less disposition to economize.

The Iron and Steel Industry—The rapid increase in the earnings of the United States Steel Corporation reflects a greater volume of business and profits more important than the small total of $12,500,000, reported for the first quarter, would indicate, even though this is an increase of $1,500,000 as compared with the previous quarter. Pig iron buying has dwindled off, but Southern furnaces sold 35,000 tons during the week; it was estimated that in the first 22 days of April at least 350,000 tons of merchant iron were sold, which is not up to the record of March business. The operation of works is better, having been increased about 4% during the week. Some disappointment was evidenced that the Pennsylvania order for equipment was not followed up by other roads. Rail-making mills hope for better business, particularly foreign. British mills are absolutely out of the market, and colonial mills are taking all the business that is offered, of which there is a fair amount.

ATLANTIC SEABOARD

BOSTON

Spot market dull and deliveries on contract sag off. Buyers still keep out of the market. Export trade may have favorable effect on coastwise situation. Foreign steamers making heavy draft on Georges Creek. Pennsylvania grades listless. Anthracite demand holds on.

Bituminous—There is practically no spot demand for Pocahontas and New River, either here or at the loading ports. Small concessions are heard occasionally but lately no new business of any consequence has developed. Contract requirements are rather less than a month ago, but it is felt that the demand from New England mills must improve soon, with the better conditions that are being predicted for textiles. At present writing, however, manufacturers are holding off, both those who have yet to buy and those who have contracted.

Sales agents are despairing of any marked increase in the volume of business for some months to come. New England is usually about the last section to be hit by any wave of prosperity and unless there is a spurt in the fall, 1915 will be charged off as another extremely dull year.

At the same time, the export market is recognized as having possibilities. The recent order of the Italian Railways for more than 300,000 tons leads some of the shippers to believe we are only at the threshold of a broad foreign demand that will lift the coastwise market out of the doldrums.

The Georges Creek shippers, by reason of their limited output, are commonly the first to feel such a development. So many steamers are waiting now at Baltimore ports that for the present coal from that field is being routed exclusively to those piers. When barges now here and en route are disposed of it is likely there will be a fortnight or more when receipts of Georges Creek will be extremely light.

Cambria and Somerset coals show the same listlessness that has been characteristic the last month or so. Anthracite barges are gradually being released to the bituminous trade but the demand is not in any way improved. One cargo of Pennsylvania coal has been on the market here for nearly three weeks.

Water Freight are a trifle easier, 75c. having been named this week for barges, Hampton Roads to Boston. On Long Island Sound rates are up 5c. on account of an extra demand for anthracite at the April circular.

Anthracite—The demand for late April loading continued strong to the end of the month. Most of the companies are carrying over a fair supply of orders for May shipment. All sizes are easy at the piers although egg is occasionally reported short.

Current quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.85@1.40	$1.15@1.60	$1.67@1.77	
Philadelphia*	2.10@2.65	2.40@2.85	2.92@3.02	
New York*	2.40@2.95	2.70@3.15	3.22@3.32	
Baltimore*	....	....	2.85@2.95	
Hampton Roads*	....	....	....	$2.65@2.80
Boston†	....	....	....	3.55@3.73
Providence†	....	....	....	3.53@3.73

* F.o.b. †On cars.

PHILADELPHIA

Anthracite still shows strength. Close of the month finds domestic sizes in good demand. Bituminous lacks tone, with no immediate improvement looked for.

Anthracite—The closing week of the month finds the operators well supplied with orders for the domestic sizes. Chestnut has fallen off somewhat, but it is understood that the surplus was very easily taken care of in other directions. The Lake season will soon be in full sway, and surplus sizes can be well taken care of, for the present at least. Broken still maintains a good lead and egg and stove are about the same as last week. Pea coal seems to be moving well, but the exceedingly low price prevailing has doubtless caused many dealers to lay in supplies now, who probably would have waited until the fall to take on their supplies of this size; $2 is now the general price prevailing at the mines, with the tax added, and in some cases absorbed.

Prices at Tidewater, closing week of the month:

	Circular	Individuals
Broken	$4.25	$4.25@4.35
Egg	4.50	4.50
Stove	4.50	4.50
Chestnut	4.75	4.65@4.75

Bituminous—There is practically no change in the bituminous situation. Georges Creek coals seem to be somewhat short of the market, but little delay is experienced in having orders filled. All the coal standing at Tidewater has been sent there for orders already in hand, and little spot coal is available.

NEW YORK

Bituminous quiet but trade is optimistic. Better outlook on prices. Current business in anthracite continues active but the outlook is uncertain.

Bituminous—While there is apparently little if any change in the bituminous market, wholesale dealers are optimistic. Business indications are encouraging and the prospects are considered bright for a fair summer. Shippers of the best grades are not over-stocked but are able to meet all immediate demands. Inquiries from manufacturers are on the increase. Some operators who held off closing contracts for the major portion of their output at the low prices which prevailed a couple of months ago are now looking forward to obtaining better figures, in view of the larger number of inquiries being received. Shipments to New England have increased considerably.

The export business is gradually picking up and the prospects are encouraging. Bunkering trade remains fair. Operations continue on about a half-time basis, owners apparently preferring to curtail production rather than see a further cut in prices.

Quotations run about as follows: West Virginia steam, $2.35@2.55; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.05@3.10; Georges Creek, $3.15.

Anthracite—The April business continues satisfactory. Prepared coals are moving well. Shippers report sufficient orders on hand to carry operators well into the next month but they are not making predictions as to what might follow. The mines are operating practically full time and production for the month will compare favorably with the April tonnage figures in previous years. There is some cutting of the circular but reports have it that individuals in order to maintain prices are granting longer credits. Lake shipments have opened and this will provide a new outlet which will prove a big help for the mine owners.

Steam coals, particularly the better grades of buckwheat, are in good demand. Nos. 2 and 3 in the better grades are practically out of the market; full circular is being obtained for these coals in the better qualities. There is plenty of the poorer grades to be had. Pea coal is very weak, the prevailing quotation being around $3.40.

The anthracite market is now quotable on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$4.70	$4.70	$4.65	$4.65
Egg	4.95	4.85@4.95	4.90	4.80@4.90
Stove	4.95	4.85@4.95	4.90	4.80@4.90
Chestnut	5.20	5.10@5.20	5.15	5.05@5.15
Pea	3.45@3.55	3.30@3.55	3.40@3.50	3.25@3.50
Buckwheat	2.55@2.80	2.35@2.80	2.50@2.75	2.35@2.75
Rice	2.05@2.30	2.05@2.30	2.00@2.25	2.00@2.25
Barley	1.80	1.55@1.95	1.75@2.00	1.50@1.90

BALTIMORE

Export movement continues to expand and April shipments will break all port records. Bituminous coals in a little better demand. Gas fuels quiet.

The immense amount of coal now being shipped out of this port on foreign contracts is the feature of this market. Unwillingness of British bottoms to go to home ports for fear of being taken over by the government is diverting much South American and Mediterranean business from England to us. That the month of April will see a total movement of 160,000 tons, or 30,000 tons in excess of the previous high record, seems assured.

Except for slack, which is strong, due to the light production, the gas-coal situation is still weak. The prospect of a light call from the Northwest because of heavy stocks still carried there prevented any upward move. Slack sold at from 70 to 75c., practically on a par with run-of-mine. Three-quarter brought around 80 and 85c.

HAMPTON ROADS

Heavy movement of export coal on both steam and sail vessels. Indications are for large dumpings in April.

The export movement of coal from Hampton seems to be increasing weekly and present indications are that the shipments both coastwise and foreign were heavy over the month end. Italy has taken a large share of the business moving. A fair estimate of the quantity shipped to the various Italian ports would be approximately 45,000 tons.

The accumulation of coal at Tidewater is perhaps lower than for months and with the amount of vessel tonnage now in port and that due the indications are that this will be reduced considerably below normal supply even with that now en route being rushed forward.

The movement is confined almost entirely to Pocahontas and New River mine-run, although it is expected there will be some shipments of the prepared coals soon. There has been no change in prices at the Hampton Roads ports and sales are close to the regular circular prices.

Bunker takings are still holding up well, vessels arriving during the week taking from 300 to 1200 tons according to the size of the steamer and her destination. The largest supply of bunkers taken by any one vessel went into the Argentine battleship "Moreno" which was supplied from barges at Newport News. This vessel took about 4000 tons.

The following steamers have sailed with cargoes of coal:

Norfolk

Vessel	Tons	Destination
G. M. Embiricos[1]	5746	Piraeus
Emily I. White	512	Santo Domingo
Elvaston[2]	6008	Montevideo

Virginian Ry.—Dumpings of this road at Hampton Roads for the week ended Apr. 24 amounted to 178,738 tons.

OCEAN FREIGHTS

Further advance in vessel rates. Fewer steamers available. Grain shippers quoting higher figures for September loading.

Freight market conditions changed very materially during the last week and rates are again advancing. A number of steamers have been chartered for export coal since last report at or about rates quoted below, and the number of available steamers has decreased owing to the rapid absorption of tonnage by various trades during the last few days. For September loading, grain shippers are offering higher rates than are current for May loading. Steamers are offered at $10.80 for four trips to the West Coast of Italy; $10.20 to Marseilles or Algiers; and $9.60 to Barcelona or Valencia, and charters have been arranged recently on about these terms. Rates on grain from the Plate have advanced and consequently outward rates on coal are unchanged. .

To	Rate	To	Rate
Havana	$2.25@2.50	Guantanamo	$3.00@3.25
Cardenas or Sagua	3.00@3.25	Demerara	5.50@6.00

Santiago	3.00@3.25	Valparaiso†	8.40@ 9.00

Note—Rates noted in **bold face** type are only approximate.

* To a direct port not east of the West coast of Italy, Spain excluded.

† With 800 tons per day discharge.

W. W. Battie & Co.'s Coal Trade Freight Report.

OCEAN CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Rosalie	British	Baltimore	Buenos Ayres	2725	$9.36
Charles Davenport		Philadelphia	Portland	1157	
Annie B. Mitchell		Philadelphia	Camden, Me.	397	1.00
Ellaline	British	Baltimore	River Plate	2491	9.12
Christoforos	Greek	Atlantic Range	Barcelona,[1]	2345	10.12
——hall	British	Virginia	Rio Janeiro		9.60
Winnfield	British	Baltimore	River Plate	2205	9.36
Egda	Norwegian	Philadelphia	Antilla	1610	
Thorsa	Norwegian	Philadelphia	Manzanillo	683	
Stella del Mare (bark)	Italian	Baltimore	Italy[2]	1026	
Florence Howard		Baltimore	Mayport	683	1.00
William Bisbee		Philadelphia	Swan Island, Me	206	1.50
Charles H. Klinck		Philadelphia	Kittery, Me.	444	1.00

[1] Valencia or Algiers. [2] West Coast.

Note—Steamers are indicated by **bold face type**, all others being schooners.

LAKE MARKETS

PITTSBURGH

Market still demoralized, with mines operating at about 50% and very little Lake coal moving. Lake Superior iron ore market opened.

The opening of the Lake Superior iron ore market last week emphasizes the backwardness of the Lake coal trade. Ore shipments are being made in small quantities and the way in which ore has sold since the opening is held to indicate that by the middle of May there will be a fair movement down the Lakes, but the coal movement seems still far in the future. While Lake coal is being moved the tonnages are almost inconsequential and there has been scarcely any buying for the season, it being a question thus far whether the regular supplies of shippers may not prove practically equal to the demand in the Northwest.

Demand for coal from manufacturers has increased slightly, and some consumers in the steel trade are taking practically their normal tonnages under long-term contracts. The spot demand continues light and the supplies are excessive, so that prices have not recovered from their demoralization. Contract prices for the twelvemonth are supposed to be based on about $1.15 for mine-run, but hardly anything is being done.

Prices for free coal we quote the same as the reduced figures given last week, but even these prices are sometimes shaded: Slack, 75@80c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1@1.05; ¾-in., $1.10@1.15; 1¼-in., $1.20@1.25, per net ton at mine, Pittsburgh district. Lake coal is reputed to be $1.15 to consumers and $1.10 to dealers but it is not firm, at these figures. Mine operations continue at about 50% of capacity.

BUFFALO

Some improvement here and there, but prices generally slack and lower than a year ago. Demand expected to improve slowly. Heavy movement of anthracite up the Lakes.

Bituminous—There is a somewhat better feeling in the trade in general, though conservative interests are slow to admit it, giving as a proof of their position that prices are still slack and many shippers are making contracts at less than last year's figures. The industrial situation is improving, with at least some promise of a return to the normal before long, and when this occurs the price of bituminous coal must advance. But there is no doubt that sellers are discouraged, offering prices 5 to 15c. lower than last year, rather than be driven out of the market entirely. At no time in this long period of depression has the seller been in such an uncertain position. It appears that the worst of the depression is over, though improvement is likely to be slow and it may find a good many shippers tied up with burdensome contracts.

This is the season for rearranging price quotations. In view of the contract prices made during the present month, leading shippers agree that maximum figures may now be placed at $2.70 for best Pittsburgh lump, $2.55 for threequarter, $2.45 for mine-run, $2.10 for slack and $2.50 for smokeless.

Anthracite—The demand is normal and there is no complaint heard from the shippers. Retailers do not think the year has done much for them, though the Buffalo city trade has been held together well.

Shipments by Lake have begun, a large fleet sailing last week. The amount cleared to date is 178,000 tons, nearly all of it to leading ports at the head of the Lakes. This large tonnage is due to the heavy winter loading of one company. In all, the list was over 30 cargoes, aggregating close to 250,000 tons. The vessels do not find much down freight and so are not anxious to leave.

TORONTO, CAN.

Demand for both domestic and steam coal light. Stocks generally large.

The demand for domestic coal is light, consumers buying from hand to mouth. The market for steam coal is also quiet, as most factories are still running considerably below capacity, with little prospect of any improvement for some time. Dealers have ample supplies on hand in all lines. Quotations for best grades are as follows: Retail, anthracite, egg, stove and nut, $8; grate, $7.75; pea, $6.75. Bituminous steam, $5.25; screenings, $4.25 to $4.50; domestic lump, $6; cannel, $7.50; wholesale f.o.b. cars threequarter lump, $3.56; screenings, $2.90.

COLUMBUS

Slight stir in the Lake trade. Domestic business dull. Steam trade is not increasing to any extent.

The best feature of the Ohio market during the past week was a slight activity in the Lake trade. The season was officially opened Apr. 15 and a small amount of coal was loaded for shipment to the Northwest; a few cargoes have already moved. The tonnage, however, is not as large as formerly because of the excessive amount carried over on the docks of the Upper Lake Ports. Chartering of boats is not active and many companies have not yet started their Lake business in any way. Lake prices will be the same as last season. One of the best features is a slight stir in the ore trade which is expected to cause a better movement of boats.

Domestic trade has been dull in every way. Dealers have not been buying except when absolutely necessary to piece out the season. In some sections retailers' stocks are fairly heavy but generally speaking they will have little to carry over. Buying for early stocking is limited to anthracite and Pocahontas. Some West Virginia splints are also in demand. Hocking lump is not moving as it is never stocked this early in the year. Retail prices are still fairly well maintained although summer levels are not far off.

Production in Ohio fields has not increased materially during the past week. Despite the small amount loaded for Lake shipment the Hocking Valley has only produced about 30% of normal and the same figures are reported from Massillon, Cambridge, Crooksville and Jackson. In the Pomeroy Bend district the output is estimated at about 50% of the average.

The only strong point in the market is the demand for the small sizes which are still scarce. This is due largely to the curtailed production of lump. Anthracite business is fairly active for this period of the year.

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.45	$1.50	.....
Inch and a quarter	1.30	1.35	$1.30
Three-quarter inch	1.25	1.30	1.25
Nut	1.15	1.25	1.15
Mine-run	1.05	1.10	1.05
Nut, pea and slack	0.75	0.75	0.70
Coarse slack	0.65	0.65	0.60

CLEVELAND

The market has no absorbing power and prices are barely holding. Manufacturing companies are buying on the open market in preference to contracting.

Receipts of coal have been light, but Pan Handle, Youghiogheny, Fairmont and West Virginia No. 8 coals sold at low prices on the spot market, often for less than jobbers are paying for shipment. Pan Handle slack sold Monday at $1.65 to $1.70 Youghiogheny at $1.65 to $1.75, Fairmont at $1.65 to $1.75 Richland three-quarter at $1.80 to $1.85 and mine-run 5c. a ton lower. This coal from across the line in West Virginia is the same as Ohio No. 8.

The Lake trade is opening slowly. W. A. Pugh, of Racine, Wis., was here Monday and contracted for vessels to transport 50,000 tons of soft coal at 40c. a ton. Most of the Lake shippers are sending a few cargoes up the Lakes, but, will not ship very heavily after the first cargoes are delivered. It is not expected Lake shipping of coal will reach a large volume before June.

Iron ore prices have been established on the same basis as last year. The prices are very low and Lake freight rates will not be any higher than in 1914. Sales last week were very large considering business conditions and ore shipments will be in excess of last year.

Quotations on coal for shipment are:

	Pocahontas	Youghiogheny	Bergholz	Fairmont	W. Va. No. 8
Lump	$3.10	......	.....	......	......
Lump, ¾ in	......	$2.20@2.25	$2.00	$1.90@1.95	$1.80@1.90
Egg	3.10	......	......	......	......
Mine run	2.65@2.70	2.10	1.90	1.85@1.90	1.75@1.85
Slack	......	1.70@1.75	1.70@1.75	1.70@1.75	......

LOUISVILLE, KY.

Market restricted to stocking and industrial demand. Mine operations slightly stronger.

The market is now on a stocking or industrial basis, there being practically no demand of any other description. The industrial consumption is improving steadily and a generous rain over the state has been of much service in restoring confidence. Stocking orders are more plentiful and operations at the mines are on the increase. Prices continue as for the last several weeks with no changes of importance.

COKE

CONNELLSVILLE

Firmer tone sentimentally but little activity and no better prices. Production and shipments increased.

Sentimentally, the coke trade has improved further, but the merchant coke market obtains no increased strength from within. There has been a constant increase in production by the producer-consumer class, which absorbs more labor and with a little further employment, the coke operators who reduced wages last year will have to restore rates to the higher level still paid by many interests, including the Frick Company. The merchant pig-iron market is nominally on a better plane, through the opening of the Lake Superior ore market last week, with a fair volume of sales, and the buying of over 60,000 tons of pig iron by the Youngstown Sheet & Tube Co. There are fair stocks of pig iron and there is not much disposition manifested towards the blowing in of idle merchant furnaces.

Coke prices are quotable as formerly but a little additional buying would probably send them up, there being little more coke available at these figures: Prompt furnace, $1.55@1.60; contract furnace to June 30, $1.60@1.65; contract furnace to Dec. 31, $1.75; prompt foundry, $2@2.35; contract foundry, $2.20@2.30, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Apr. 17 at 298,222 tons, an increase of 6007 tons, and shipments at 294,995 tons, an increase of 7166 tons.

Buffalo—There is little more coke moving, but the increase is not enough to make any real difference in the trade and prices remain as before. It will require a decided increase in volume to affect prices, which have long been at what was regarded as the bottom. Quotations remain at $4.15 for best 72-hr. Connellsville foundry, with stock coke $3.30.

Chicago—Some inquiries are being put out by large consumers for prices under contract for foundry use. The market this week has been quiet but firm, and little domestic business is reported. Quotations are as follows: Byproduct, $4.45@4.65; Connellsville, $4.60@4.75; Wise County, $4.50@4.65; gas coke, $3.75@4; furnace, $4.50@4.65.

MIDDLE WESTERN

GENERAL REVIEW

Dullness still prevails but signs of improvement are appearing. Screenings firmer. More activity in anthracite.

The market still continues extremely dull, but prices are generally well sustained, considering the depression. Shippers who have feared that prices would slump, because of impatience to make sales under present conditions, find their anticipations not realized. Everybody seems to be of one mind to maintain prices in the face of a paucity of orders. It is now realized forcibly that cutting prices does not create additional orders. A distinct impression prevails that things are slowly changing for the better.

The demand for steam coals is still at a low ebb, but shippers think the outlook better than for some time past. Increased inquiries are being received for future deliveries. Slow progress is still noted in contract making. The screenings situation generally shows strength, and the recent slight reaction has been entirely overcome. There is little buying in domestic coals, and the retailers are placing practically no orders, although in some cases their stocks are very moderate.

CHICAGO

Mine operations much curtailed and a number closed for the summer. Screenings active.

The Indiana mines are operating about two days per week on the average, and several additional mines have been closed down this week for the summer months. It is said that less foreign coals are being sold at the present time in the Indiana territory than last year. The operators are about to inaugurate a campaign for the consumption of home coal by state and municipal institutions which in times past largely bought coal from mines in other states. The demand for screenings is better, and prices are averaging 5c. per ton higher than last week.

The Springfield operators are closing down their mines rather than sell coal below cost of production. This has naturally decreased the output of screenings and caused the price to advance about 10c. per ton.

There is little change in the Franklin and Williamson County situation, and prices are well maintained in the face of light production. The demand is more noticeable for washed sizes for steam purposes than anything else.

The smokeless market is hesitating. There is no demand for what little coal is on track here, and the operators' representatives are not making much headway in placing contracts. Slightly better demand is said to be shown for the coarse sizes.

Anthracite shipments have increased over last week, although it can be said that the yards are not showing any great tendency to stock up at present quotations.

Prevailing quotations are as follows:

	Williamson and Franklin Cos.	Springfield	Sullivan	Clinton	Carterville
Lump	$1.25@1.35	$1.35	$1.35@1.50	$1.25@1.45	$1.45@1.65

ST. LOUIS

Some contracts closed with figures generally low. Market dull except on screenings, which are active.

A few inquiries for contract coal seem to be the only life of the local market. During the past week the Frisco R.R. fuel contracts were let, and a few other minor contracts were also awarded. Prices were below what was anticipated in a general way, which would seem to indicate that the operators are not figuring on a prolonged suspension during the spring of 1916.

The domestic market is extremely quiet, there being no demand either from the city or country. Excepting for a fairly heavy movement of screenings, there is nothing unusual in the steam trade. For a few days screenings may be in demand, and again there is apparently an over-production, or the buyers are holding off to force lower prices. The screenings market will continue to be firm for the next month or two at least.

A small tonnage of anthracite is moving in, and that is practically all of the outside fuel that there is any demand for; this is largely for storage purposes. There is no change in circular prices. Carterville screenings being worth about 85c., and Standard screenings 80 to 85c.

INDIANAPOLIS

New retail prices announced. Trade very quiet but a slight improvement is noticeable. Screenings short.

Mining conditions in Indiana have been almost in a rut for a month, the only change being an almost imperceptible improvement in the industrial situation. Coal salesmen say that the improvement is evident, however gradual it may be. Mines over the state seem to be averaging three to four days a week. The demand for slack continues to be the feature of the trade and operators are getting 85 to 95c. for it. Most companies have all they can do to take care of their contract orders on screenings and are not in the open market for this grade. The supply of fine coal depends on the railroad takings of 1¼-in. lump.

The local retailers reduced their prices to the summer level, Apr. 20. The reductions amounted to 50c. a ton on most coals, with 75c. on anthracite and Pocahontas. The new schedule is:

	Per Ton
Linton No. 4, forked	$3.00
Indiana lump, forked	2.75
Indiana lump and egg, screened	2.50
Kanawha lump, forked	4.25
Ohio Hocking lump, forked	4.25
Ohio Hocking washed egg	4.50
Kentucky lump	4.50
Ohio Jackson lump, forked	5.00
Blossburg smithing	5.50
Cannel lump	6.00
Pocahontas forked lump	5.50
Pocahontas shoveled lump	5.00
Pocahontas mine run	4.00
Pocahontas nut and slack	3.50

	Per Ton
Anthracite chestnut	7.75
Anthracite stove and egg	7.50
Anthracite grate	7.25
Connellsville coke	6.00
Indianapolis byproduct coke	5.50

—Extra Delivery Charge—

Egg, 50c. a ton extra, ground floor or dumped in cellar.

Bags, 75c. a ton extra, carried into cellar.

Charge for chute or wheelbarrow, 25c. a ton.

Coke, bags 60c. bags in cellar 80c.

KANSAS CITY

Retail business quiet but the wholesale trade is improving.

The wholesale business has been doing a little better but prices, which are at the very lowest figure, have not been affected. However, more factories operating than have been for some time and the agencies expect to have the largest business this season they have had for years. Steam grades are all that have been moving and they have been rather slow.

PORTLAND, ORE.

Demand light and summer prices will soon be in effect unless mine figures are advanced.

Just as the coal dealers were planning on announcing summer quotations, the rumor reached Portland that the mines in Utah are planning an advance in prices. Whether they will become effective or not is a question yet to be answered. On account of the high charter rates it is improbable that any coal will be brought to this city from Australia next fall.

PRODUCTION AND TRANSPORTATION STATISTICS

NORFOLK & WESTERN RY.

The following is a statement of coal handled by the N. & W. Ry. during March and the past four months in short tons:

	December	January	February	March
Pocahontas Field	798,182	912,682	835,826	1,003,437
Tug River District	227,944	298,766	243,910	282,886
Thacker District	227,938	257,580	195,557	227,817
Kenova District	90,030	98,422	67,667	66,605
Clinch Valley District	135,362	169,581	129,193	144,031
Other N. & W. Territory	1,686	3,769	1,785	2,478
Total N. & W. Fields	1,481,142	1,740,800	1,473,938	1,727,254
Williamson & Pond Creek R.R.	62,271	58,296	58,101	48,052
All other railroads	97,752	87,842	88,982	129,446
Grand total	1,641,165	1,886,938	1,621,021	1,904,752

Distribution of shipments for March was:

	Shipped	Tipple	Total
Pocahontas	879,237	13,433	892,670
Tug River	281,162	1,261	282,423
Thacker	182,943	7,986	190,929
Kenova	58,867	7,738	66,605
Total	1,402,209	30,418	1,432,627

Shipments of coke entirely from the Pocahontas field, amounted to 57,584 tons.

VIRGINIAN RAILWAY

Shipments over this road for February of the current year amounted to 283,430 short tons as compared with 344,139 during the preceding month.

BITUMINOUS COAL MOVEMENT

The following is a summary of the movement of coal and coke over 13 principal railroads during February and the first two months of the last two years, in short tons:

	February		2 Months	
Anthracite	1914	1915	1914	1915
Baltimore & Ohio[1]	120,789	95,779	258,059	218,856
Chesapeake & Ohio[1]	1,063	962	2,106	1,731
Erie[2]	597,304	600,188	1,388,374	1,246,436
Pennsylvania[1] [3]	705,020	771,328	1,620,047	1,665,857
Virginian[2] [1]	9	......	9	98
Total 5 roads	1,424,185	1,468,257	3,268,595	3,132,978
Bituminous				
Baltimore & Ohio[1]	2,517,219	2,026,142	5,614,859	4,464,233

Total 8 roads	1,697,002	1,435,971	3,453,064	2,790,264

Total Coal and Coke 13 Roads	1914	1915
January	18,157,998	15,685,811
February	15,446,830	13,702,789
Total 2 months	33,604,828	29,388,600

[1] Includes coal received from connecting lines.

[2] Includes company's coal.

[3] Does not include company's coal hauled free.

Note:—The Southern Railway hauled 356,663 short tons of bituminous coal during February, 1914, and 286,243 short tons during the two months ending February.

EXPORTS BY DISTRICTS

The following is a statement of exports of coal from the United States by states during February:

Districts	Anthracite	Bituminous	Coke
Maine and New Hampshire	503	40	......
Maryland	......	79,029	......
New York	2,827	1,345	131
Philadelphia	386	32,794	95

Dakota	882	5,814	173
Duluth and Superior	133	5,284	160
Michigan	......	56,401	5,625
Rochester	2,269	5,174	185
St. Lawrence	58,131	25,293	1,290
Vermont	686	502	165
Total	178,240	584,888	44,309

PENNSYLVANIA RAILROAD

The following is a statement of shipments over the P. R.R. Co.'s lines east of Pittsburgh and Erie for March of the current year and the three months of 1914 and 1915, in short tons:

	March		Three Months	
	1915	**1914**	1915	**1914**
Anthracite	814,872	1,086,344	2,480,729	2,706,391
Bituminous	3,243,270	4,740,313	9,845,684	12,414,492
Coke	876,532	1,027,339	2,303,835	2,700,237
Total	4,934,674	6,853,996	14,630,248	17,821,120

FOREIGN MARKETS

GREAT BRITAIN

Apr. 16—Outputs are more satisfactory and the market is hardly so firm. Quotations are approximately as follows:

Best Welsh steam	Nominal	Best Monmouthshires	$8.40@8.52
Best seconds	Nominal	Seconds	7.80@8.04
Seconds	$8.64@8.88	Best Cardiff coals	5.22@5.34
Best dry coals	8.76@9.00	Cargo smalls	4.44@4.68

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Chartering is less active but rates are fully maintained. Rates are approximately as follows:

Gibraltar	$3.84	Naples	$6.00	Las Palmas	$3.84
Marseilles	4.439	Venice	9.60	St. Vincent	4.44
Algiers	4.246	Alexandria	6.36	Rio de Janeiro	6.72
Genoa	6.00	Port Said	6.24	Monte Video	6.24
				River Plate	6.48

Exports—British exports for March and the first three months of past three years were as follows:

	March			Three Months		
To	1913	1914	1915	1913	1914	1915
Russia	111,338	175,134	......	445,120	552,555	......
Sweden	281,468	239,201	257,038	887,124	746,078	757,277
Norway	201,410	233,444	296,307	640,918	695,324	692,344
Denmark	252,905	271,695	285,880	783,134	719,769	733,007

[1] Includes Azores and Madeira. [2] Including Anglo-Egyptian Sudan. [3] And dependencies. [4] And Canaries. [5] West Africa.

FRANCE

For the first six months of last year the coal imports of France broke all records, although the native production until the outbreak of the war was normal. After Aug. 1 the supply from Germany and Belgium was shut off, so that France had to depend upon Great Britain for its foreign coal, although small quantities were received from the United States. Of the foreign coal reecipts in 1914, Great Britain furnished 10,759,085 tons, as compared with 11,257,228 tons in 1913. The receipts of Belgian and German coal were 2,032,098 and 2,341,996 tons, respectively, against 3,669,395 and 3,490,576 tons, respectively, in 1913. The bulk of the French coke imports in 1914 came from Germany, 883,033 tons, as compared with 2,392,897 tons in 1913.

DIVIDENDS

The following is a partial list of the more important dividends announced since the first of the year:

Burns Bros.—Regular quarterly dividend on the common of 1¼%, payable Feb. 15 to holders of record, Feb. 1, and also regular quarterly on the preferred No. 8 of 1¾%, payable Feb. 1 to holders of record, Jan. 15.

Consolidation Coal—Regular quarterly of 1½%, payable Jan. 30 to holders of record, Jan. 23. The transfer books are not closed for this dividend.

Dominion Coal—Preferred dividend No. 44 of 3½%, payable Feb. 1 to holders of record, Jan. 6.

Maryland Coal of West Virginia—Dividend of 1%, payable Feb. 1 to holders of record, Jan. 22 to Jan. 31 inclusive.

Pacific Coast—Regular quarterly dividend on the common and second preferred of 1%, and on the first preferred of 1¼%, all payable Feb. 1 to holders of record, Jan. 21 to Feb. 1.

Lehigh Coal & Navigation—Regular quarterly dividend of $1, payable Feb. 27 to holders of record Jan. 3.

Jefferson & Clearfield Coal & Iron—Dividend of 1¼% on the preferred, payable Feb. 15 to holders of record, Feb. 9.

American Coal—Dividend of 3%, payable Mar. 1 to holders of record, Feb. 27.

American Coal Products—Regular quarterly dividend of 1¾% on both the common and the preferred, the former payable Apr. 1 to stock of record Mar. 26 to Mar. 30, and the latter payable Apr. 15 to stock of record Apr. 11 to Apr. 14.

Central Coal & Coke—Regular quarterly dividend on the preferred of 1¼%, payable Apr. 15 to stock of record Apr. 1 to Apr. 15.

Temple Coal—Regular quarterly dividend on the preferred of 2%, payable Apr. 12 to holders of record, Apr. 2.

I. C. C. DECISIONS

I. C. C. Nos. 5336, 5336 Sub. No. 1, 5336 Sub. No. 2, 5336 Sub. No. 3, 5358, 5358 Sub. No. 1—McCan Coal Co., Elliott Splint Coal Co., Gilmer Consolidated Coal Co., Queen Shoals Coal Co., Morris Fork Coal Co., Elk Manor Coal Co., vs. Coal & Coke Ry. Co.

1. Upon a supplemental hearing the coal operators and the defendant railway company submitted a statement showing the mine ratings which shall form the basis for the distribution of coal cars during periods of car shortage. This agreement being satisfactory to all concerned, is accepted by the commission as a compliance with its original findings herein, 30 I. C. C., 531.

2. During periods of car shortage, the allotment due any particular one of the four mining operations controlled by the Davis Colliery Co. shall be used by that particular mine, and should such mine countermand its order for cars on any day, such cars shall revert to the general supply and be distributed among the mines along the line of the defendant railway company according to the respective mine ratings. Rail & River Coal Co. vs. B. & O. R.R. Co., 14 I. C. C., 86, distinguished.

3. Cars which are partially loaded and remain over until the next day to be fully loaded shall be charged against the mine loading the same, as if such cars were empty.

I. C. C. No. 6128, Sub.—No. 1 and Sub.—No. 2—Vulcan Coal & Mining Co., St. Louis—Coulterville Coal Co., Groom Coal Co. vs. Illinois Central R.R. Co.

Complainants request reparation for damages occasioned by the alleged failure of the defendant upon reasonable request to furnish cars for the shipment of coal from complainants' mines; defendant denies the Commission's jurisdiction and argues that the question raised is one for the determination of the courts: **Held:**

1. The question as to the extent to which defendant failed to comply with the duty it owed complainants is an administrative one, of which the Commission alone can take original jurisdiction.

2. It is obvious that the absolute refusal of a carrier to furnish a shipper cars would be a violation requiring no administrative determination and of which the courts could take primary jurisdiction.

3. Considerations of expediency should have no weight in deciding whether or not the Commission should assume jurisdiction.

4. Reference made to cases dealing with the question of priority of jurisdiction as between the Commission and the courts.

5. The assumption of jurisdiction in the present case is not inconsistent with the mandamus provisions of section 23 of the act. B. & O. R.R. Co. vs. Pitcairn Coal Co., 215 U. S., 481.

6. Defendant is not deprived of its rights under the seventh amendment to the Constitution.

7. A carrier must do more than provide itself with sufficient equipment for the slack period of coal production.

8. A carrier must assume the burden of explaining or excusing its failure to furnish cars.

9. The question of whether or not the car supply was reasonably adequate at these particular mines and the question of the amount of damages, if any, left for a subsequent hearing.

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

+Indicates contracts regarding which official information has been received.

Recast

In the following table we give a list of all old contracts coming up for consideration during the ensuing week. The table gives our contract number, the name of the purchaser, city, tonnage and page on which the detail notice appeared.

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

+No. 228—Cambridge, Mass.—Sealed proposals were received on this contract (p. 446) until 8 p.m., Apr. 30. There will be from 5000 to 7000 tons of bituminous coal and 4000 to 6000 tons of anthracite required in addition to some wood. All bids must be accompanied by a certified check for $500, and the successful bidder will be required to furnish a satisfactory bond for 20% of the estimated amount of the contract awarded. Proposal forms and specifications may be had on application. Address Supt. of Schools, Michael E. Fitzgerald, City Hall, Cambridge, Mass.

+No. 397—Lorain, Ohio—Bids on this contract (p. 567) will be received until May 12 instead of Apr. 19 as previously announced. All bids must be accompanied by certified checks for $100, and specifications can be seen at the rooms of the School Board. Bids must be submitted on blank forms furnished by the board for that purpose. Address Clk. E. Bruell, Board of Education, Lorain, Ohio.

+No. 402—New Haven, Conn.—Bids on this contract (p. 567), which provides for furnishing the fuel requirements for the local Board of Education, will be received until 5 p.m., May 4. Copies of specifications and proposal forms may be obtained on application. Address Secy. of Bd. of Edu. G. T. Hewelett, 87 Orange St., New Haven, Conn.

+No. 461—Boston, Mass.—Bids on this contract (pp. 627, 748), which provides for furnishing various harbor institutions with coal, were as follows:

		H. T. Sch. C. Co.		Metro. C. Co.		N.E.C. & C.Co.	Gor. Loe. C. Co.

*Proposal not in due form.

Address Supt. of Supplies D. Frank Doherty, Room 808, City Hall Annex, Boston, Mass.

+No. 465—St. Louis, Mo.—Bids on this contract (p. 627), which provides for furnishing the local Board of Education with about 37,000 tons of bituminous and anthracite coal, will be received until 2 p.m., May 4. Address Supply Comr. E. M. Brown, 3431 School St., St. Louis, Mo.

+No. 487—Reading, Ohio—Bids on this contract (p. 665), which provides for furnishing 2000 tons of New River smokeless coal, either nut, slack or mine-run, at the local Electric Light & Water Works Department, will be received until noon, May 10, instead of about May 1, as previously announced. Deliveries are to be made as required during the fiscal year beginning June 1. A certified check for $100 must accompany each bid. Address Clk. C. V. Dils, Bd. of Pub. Affairs, 1701 Main St., Reading, Ohio.

+No. 507—Allentown, Penn.—Bids on this contract (p. 665) were closed on Apr. 28. The contract provides for 1500 tons of pea, 100 tons of chestnut, and 75 tons of stove coal. Deliveries are to be completed by Aug. 2. Address Secy. T. P. Wenner, Board of Education, Allentown, Penn.

+No. 558—Hamilton, Ohio—The bids on this contract (p. 709) will be received until noon, May 12. Guaranteed analysis must accompany all bids, and the requirements are as follows: 1600 tons of high-grade mine-run smokeless, 1600 tons of high-grade mine-run bituminous, 400 tons of high-grade nut and slack coal. Bids must include cost of delivery in the basements of various school houses as directed, during the school year 1915-16. Address Clk. Charles F. Holdefer, Bd. of Edu., Hamilton City School District, Hamilton, Ohio.

+No. 572—New York, N. Y.—The requirements on this contract (p. 749), which provides for furnishing various army posts with coal, have been reduced the following amounts: Bituminous, 34 tons; anthracite, 20 tons. Address Col. A. L. Smith, Depot Quartermaster, Army Bldg., Whitehall St., New York City.

⁂

New Business

+No. 596—Galveston, Tex.—Sealed bids will be received until 2 p.m., May 5, for furnishing and delivering coal to vessels of the United States Coast Guard during the fiscal year ending June 30, 1916. Address Collector F. C. Pabst, Custom House, Galveston, Tex.

No. 597—Columbus, Ohio—The Board of Education will open bids May 4 for approximately 9000 tons of coal, to be delivered to the various school buildings of the city. The specifications call for lump coal either from the Hocking Valley, Pocahontas or New River district or from other fields in West Virginia. Prospective bidders are asked to submit bids on any or all varieties. Address Clk. Bd. of E. B. McFadden, Columbus, Ohio.

No. 598—New Orleans, La.—The United Fruit Co. will receive bids beginning May 1 on a three-year contract to supply all its ships with coal. The requirements amount to 150,000 short tons annually, and this is the largest contract to be let in this vicinity. The business has heretofore been held by the Monongahela Coal & Coke Co. Address Purchasing Agent, United Fruit Co., New Orleans, La.

No. 599—Louisville, Ky.—The J. M. Robinson, Norton & Co., who use over 120 tons of coal a month, will contract June 1 for a year's supply, half of which must be No. 8 Kentucky steam nut coal and half Pittsburg and Jellico nut and slack. Delivery by wagon. Address J. B. Curry, J. M. Robinson, Norton & Co., 533 West Main St., Louisville, Ky.

No. 600—Chicago, Ill.—The American Electric Co. will be in the market about June 1 for three cars per month of Illinois mine-run coal. The contract is to cover a period of one year. Address Mr. Boice, American Electric Co., 64th and State St., Chicago, Ill.

No. 601—Clinton, Iowa—The Clinton Sugar Refining Co. will be in the market on or about June 1 for their yearly requirements, approximating 70,000 tons of coal, in average monthly shipments of 6000 tons. They have been using some Illinois 1½-in. to 2-in. screenings. Address Traffic Manager, Clinton Sugar Refining Co., Clinton, Iowa.

+No. 602—Beverly, Mass.—The City Government of this place received bids until 7 p.m., Apr. 30, to supply its coal requirements for the season of 1915. All bids must be accompanied by a certified check for $200 and must be made in accordance with specifications on file at the office of the clerk at the City Hall. Address Clk. of Coms. Frederick B. Browning, Beverly, Mass.

No. 603—Louisville, Ky.—The Inter-Southern Life Insurance Co., which usually consumes about six tons a day, will be in the Market June 1 for a year's supply of mine-run coal. Delivery is by wagon and in quantities as required. Address Supt. G. W. Weingardner, Inter-Southern Life Insurance Company, Inter-Southern Bldg. Louisville, Ky.

+No. 604—Newton, Iowa—Sealed bids will be received until 7:30 p.m., May 5, for furnishing the local Water Works Plant with coal during the fiscal year beginning June 1. Bids are requested on lump, mine-run and steam coal, and are to include cost of delivery in bins at the pumping station. Address City Clk. E. G. Finch, Newton, Iowa.

+No. 605—New York, N. Y.—Sealed bids will be received until 2 p.m., May 5, for furnishing, delivering and trimming 650,000 lb. of egg coal to the Asphalt Plant, 90th and 91st St. and East River. Deliveries are to be completed by Dec. 31. A bond for $700 will be required, and all bidders must inclose a check for 5% of their bids. Blank forms and specifications may be obtained on application. Address Pres. of the Borough Marcus M. Marks, Room 2034, Municipal Bldg., New York.

No. 606—Fort Wayne, Ind.—The Bash Fertilizer & Chemical Co. will probably enter into a contract about June 1 for steam coals. They prefer Ohio and West Virginia coals. Address Receiver E. W. Cook, Bash Fertilizer & Chemical Co., Fort Wayne, Indiana.

+No. 607—New Orleans, La.—Bids will be received until 2 p.m., May 5, for furnishing and delivering coal to vessels of the U. S. Coast Guard at this place. Address Special Deputy Collector Calhoun Fluker, Custom House, New Orleans, La.

No. 608—Louisville, Ky.—The Louisville Cereal Mills will let a contract June 1 for their annual supply of nut and slack coal, involving between two and three cars a week. Bids are let on a competitive basis. Address L. C. Ewing, Louisville Cereal Mills, Louisville, Ky.

+No. 609—Munhall, Penn.—The Board of Education at this place will receive bids until May 8 for furnishing lump and slack coal to the local school. Address Secy. Bd. of Dir. John Bell, Jr., 1302 Louise St., Munhall, Penn.

No. 610—Dubuque, Iowa—The A. Y. McDonald Manufacturing Co. will soon be in the market for their coal and coke requirements for another year beginning June 1, 1915. Address Purchasing Agent, A. Y. McDonald Manufacturing Co., Dubuque, Iowa.

+No. 611—Ada, Minn.—The Water and Light Commission at this place will receive bids until 8 p.m., May 3, for furnishing coal required at the Electric Light Plant during the fiscal year terminating Apr. 1, 1916. Address Clk. Peter Sharpe, Water and Light Commission, Ada, Minn.

+No. 612—New York—Sealed proposals will be received until 11 a.m., May 6, for furnishing and delivering approximately 84,160 gross tons of anthracite and 4700 tons of semibituminous coal to the New York schools and the several offices of the Department of Education. Separate bids must be submitted for each district, and deliveries are to be completed before Mar. 31, 1916; deliveries are to be at such times and in such quantities as may be directed. Blank forms and further information may be obtained on application. Address Supt. of School Supplies Patrick Jones, Bd. of Edu., Park Ave. and 59th St., New York City.

+No. 613—Emmetsburg, Iowa—The City Government at this place will receive bids until 8 p.m., May 3, for furnishing coal as may be required. Address City Clk. T. F. Rutledge, Emmetsburg, Iowa.

+No. 614—Titusville, Penn.—The Board of Education at this place contracts about June 1 of each year for 2000 tons of coal. The current contract provides for three quarter Youghiogheny lump at $2.40 per ton f.o.b. The call for bids is advertised. Address City Mgr., H. A. Holstein, Titusville, Penn.

+No. 615—Seattle, Wash.—Sealed proposals will be received by the Coast and Geodetic Survey for furnishing the fuel requirements of five steamers at different points in Alaska during the coming summer. Address Capt. J. F. Pratt, Inspector, Coast and Geodetic Survey, 204 Burke Bldg., Seattle, Wash.

+No. 616—San Francisco, Calif.—Sealed proposals will be received by the lighthouse inspector at this place until May 21 for furnishing the annual supply of bituminous coal. Blank proposal forms and particulars may be obtained on application. Address, Lighthouse Inspector, San Francisco, Calif.

+No. 617—Kalamazoo, Mich.—The Municipal Government at this place will be in the market about June 1 for 2000 tons of West Virginia slack coal. The call for bids is advertised and the current contract was made at about $2.72½ per ton. Address, City Clk., C. L. Miller, Kalamazoo, Mich.

+No. 618—Toledo, Ohio—Bids will be received by the local Board of Education until May 1 for furnishing approximately 10,000 tons of coal to the public schools during the fiscal year beginning June 1. Address, Dir. of Schools Geo. L. McKesson, Administration Bldg., Toledo, Ohio.

+No. 619—Appleton, Minn.—Sealed proposals will be received by the Village Council until 8 p.m., May 3, for furnishing approximately 600 tons of Youghiogheny lump coal. Prices should be quoted f.o.b. cars at Appleton. Address, Recorder Henry Lende, Appleton, Minn.

+No. 620—Webster, S. D.—The Municipal Government at this place will receive sealed bids until 8 p.m., May 3, for furnishing steam coal as required until Apr. 1, 1916. Prices should be quoted f.o.b. shipping point. Address, City Audr. J. B. Egeland, Webster, S. D.

+No. 621—Luverne, Minn.—The Municipal Government at this place will contract about June 1 for 1200 to 1500 tons of coal for delivery during the next year. The present contract is being filled with Illinois "Purity" 3x6 egg, for which $1.40 is being paid f.o.b. mines. Address Supt. Jas. Hughes, Municipal Power Plant, Luverne, Minn.

+No. 622—Lancaster, Penn.—Sealed proposals will be received by the Municipal Government until 9 a.m., May 3, for furnishing coal to the Lancaster County Prison, as follows: 125 tons of pea; 100 tons of nut; 25 tons of broken. Address, Solicitor W. H. Kready, 42 North Duke St., Lancaster, Penn.

+No. 623—Newton, Iowa—The Municipal Government at this place will be in the market about June 1 for 20 tons of Iowa mine-run coal per day. The call for bids is advertised, and the current contract was made at $2.48 per ton. Address, Supt. C. O'Leary, City Power Plant, Newton, Iowa.

+No. 624—Providence, R. I.—The Board of Education at this place will be in the market about June 1 for 8500 tons of anthracite coal to be delivered as required. The contract last year was awarded on Lehigh (Highland) egg coal at $5.94 per ton. Bids are requested by circular letter. Address School Committee, 32 Sumner St., Providence, R. I.

+No. 625—Mt. Clemens, Mich.—Sealed bids were received by the Board of Public Works until 4 p.m., Apr. 30, for furnishing the coal requirements for the local water works pumping station during the fiscal year beginning June 1. The bids were received on Hocking Valley and West Virginia threequarter lump, and for nut, pea, and slack coal. Address Deputy City Clk., Marie J. Behnke, Bd. of Pub. Wks., Mt. Clemens, Mich.

+No. 626—Boston, Mass.—Sealed proposals will be received until 2 p.m., May 5, for furnishing and delivering on board vessels, coal required by the United States Coast Guard at this place. Proposals must in all cases conform with specifications, instructions, etc., copies of which may be had on application. Address Collector Edmund Billings, Custom House, Boston, Mass.

+No. 627—Lancaster, Penn.—The School Board at this place received bids until 11 a.m., Apr. 27, for furnishing about 1000 tons of anthracite, pea, nut, stove, and egg coal. Address Chn., A. C. Welchans, 202 James St., Lancaster, Penn.

No. 628—Elkhart, Ind.—The Chicago Telephone Supply Co. is in the market for their fuel requirements for the year 1915, covering two or three carloads of West Virginia or Kentucky coal per month. They are asking quotations on Kentucky block and egg. Address Pur. Agt. A. J. Briggs, Chicago Telephone Supply Co., Elkhart, Ind.

+No. 629—Medford, Mass.—Sealed proposals were received until 9 a.m., Apr. 30, for furnishing the local Fire Department with 137 tons of the best grade anthracite egg, stove, and pea coal. Price to be quoted for delivery at the different fire houses at such times and quantities as may be required. Address Chief of Dept., C. E. Bacon, City Fire Department, Medford, Mass.

+No. 630—Norwood, Mass.—Sealed proposals were received until 8 p.m., Apr. 30, for furnishing the local Municipal Government with coal as follows: Stove, 45 tons; broken, 260 tons; egg, 50 tons; nut, 25 tons; Pocahontas bituminous, 870 tons. Bids were to be f.o.b. Norwood or delivered at the various municipal buildings. Address Gen. Mgr. C. A. Bingham, Bd. of Selectmen, Municipal Building, Norwood, Mass.

+No. 631—Milwaukee, Wis.—Sealed proposals will be received by the Department of Public Works until 10:30 a.m., May 1, for furnishing and delivering 1000 tons of coal to the High Service pumping station, delivery to commence within ten days after the award of the contract and continue at the rate of 80 tons per month. The successful bidder must furnish either a deposit of $500 or a bond for $1000. Address Deputy Comr. of Pub. Wks., Percy Braman, Department of Public Works, Milwaukee, Wis.

+No. 632—Phillipsburg, N. J.—The Board of Education at this place received bids until 8 p.m., Apr. 28, for furnishing the coal required at the public schools during the ensuing year. Specifications are on file at the office of the Secretary of the Board. Address Secy. George W. Smith, Bd. of Ed., Phillipsburg, N. J.

+No. 633—Hot Springs, S. D.—Sealed proposals will be received by the National Home for Disabled Volunteer Soldiers until 2 p.m., May 12, for furnishing 9000 net tons of lignite coal during the ensuing year. Blank proposal forms and specifications may be had on application. Address Treas. and Quartermaster, William H. Stanley, N. H. D. V. S., Hot Springs, S D.

+No. 634—Pipestone, Minn.—The City Government at this place is advertising for coal for the local pumping station. Youghiogheny lump and Elkhorn screenings are required. Address City Clerk, Pipestone, Minn.

+No. 635—Ortonville, Minn.—Sealed bids will be received by the City Government at this place until 8 p.m., May 3, for furnishing approximately 700 tons of Pocahontas coal to be delivered at the City Water and Light Plant. Address City Clk. M. E. Scheibe, Ortonville, Minn.

+No. 636—Melrose, Minn.—The Water and Light Commission at this place will receive bids until 8 p.m., May 3, for furnishing about 1200 tons of rough lump coal. Address Charles Kramer, Bd. of Water and Light Commission, Melrose, Minn.

+No. 637—Toledo, Ohio—The Board of Education at this place will receive bids until noon, May 1, for supplying coal during the year ending June 1, 1916, as follows: 3300 tons of West Virginia smokeless mine-run, 3400 tons of West Virginia gas mine-run, 3000 tons of West Virginia or Kentucky slack, 275 tons of smokeless egg or lump, 200 tons of egg, stove and chestnut. A certified check for $1000 must accompany all bids for bituminous coal and a check for $100 must accompany the bids on anthracite. Bidders must also give full particulars regarding the commercial name of the coal and price quoted is to be per short ton and cover cost of delivery in bins and trimmed. About 7000 tons is to be delivered before Sept. 1 of the current year. The coal is in all cases to be subject to inspection before unloaded from the railroad car. Address Dir. of Schools George L. McKesson, Toledo, Ohio.

+No. 638—Baltimore, Md.—Sealed proposals will be received until May 5 for supplying the United States Coast Guard, together with vessels at Arundel Cove, Md., with coal as may be required during the fiscal year ending June 30. Proposals must, in every case, conform with the specifications, instructions, etc., which may be obtained on application. Address Collector W. S. Ryan, Custom House, Baltimore, Md.

No. 639—Boston, Mass.—Sealed proposals will be received until 4:30 p.m., May 1, for furnishing 200 tons of coal to the Franklin Union Building. A certified check for $50 must accompany each bid, and details in regard to commercial name of the mine, location, etc., given. Address Pres. Richard Olney, the Franklin Foundation, Berkeley St., Boston, Mass.

Awards

+No. 282—Meriden, Conn.—This contract (p. 448), which provides for furnishing the local schools with 800 tons of anthracite coal, has been awarded to **Lyon & Billard.** Address Town School Committee, Meriden, Conn.

+No. 443—Troy, N. Y.—This contract (p. 627) has been awarded to **Peterson & Packer Coal Co.** on the following basis:

	City Hall	Schools
Grate coal	$5.48	$5.68
Egg	6.25	6.54
Stove	6.25	6.54
Chestnut	6.38	6.73
Pea	4.87	4.75

The prices given are for April delivery. On grate coal an addition of 10c. per ton is made for May delivery, 20c. on deliveries between June 1 and 15, and 25c. on deliveries made between June 15 and Mar. 31, 1916. The prices on all other grades are uniform throughout the period. For the Department of Charities deliveries of stove coal in half-ton lots will be made at $6.60, and $6.75 in quarter-ton lots; deliveries of chestnut at $6.85 in half-ton lots, and $7 in quarter-ton lots. Address Secy. John J. McLaughlin, Board of Contract and Supply, Room 21, City Hall, Troy, N. Y.

+No. 446—Buffalo, N. Y.—The Larkin Co. advises that it has closed its contract (p. 627) providing for a supply of slack coal. Address Pur. Agt. F. J. Arthurs, Larkin Co., Buffalo, N. Y.

+No. 452—San Francisco—This contract (p. 627), which provides for furnishing coal for army transports and other purposes at this place was awarded to the **Western Fuel Co.** on Wellington coal. Prices varied according to delivery as follows: In holds of vessels, transport dock, $6.86; on board vessels in sacks, $8.11; at recruiting office, Oakland, Calif., $11; at S. F. National Cemetery, $10.50. Address Depot Quartermaster, Lieut.-Col. W. H. Hart, 1086 North Point St., San Francisco, Calif.

+No. 491—Alexandria, Minn.—This contract (p. 665), which provides for furnishing the Local Board of Public Works with from 1500 to 1800 tons of Elkhorn and Youghiogheny screenings, has been awarded to the **Northwestern Fuel Co.,** of St. Paul, Minn. Address Chf. Clk., C. J. Smidblad, Board of Public Works, Alexandria, Minn.

+No. 566—Boston, Mass.—Awards on this contract (p. 709), which provides for furnishing the Board of Education with fuel requirements for the period beginning June 15 of the current year and ending Jan. 31, 1916, were as follows: BITUMINOUS—**Massachusetts Wharf Co.,** East Boston, $4.30; Brighton, $4.40. **D. Doherty Co.,** Dorchester, $4.33. **John A. Whittemore's Sons,** West Roxbury, $4.55. **Metropolitan Coal Co.,** the whole city, $4.38. **City Fuel Co.,** the whole city, $4.10. ANTHRACITE—**The Staples Coal Co.** was awarded most of the anthracite portion of this contract at $5.84 for furnace and $6.37 for egg, its contracts covering the following districts either in their entirety or in part: City proper, South Boston, East Boston (in part), Roxbury, Dorchester (in part), Charlestown, Brighton (in part), West Roxbury, Hyde Park, the whole city (in part). **The Massachusetts Wharf Coal Co.** was awarded part of the East Boston contract at $5.80 for furnace and $6.32 for egg; also part of the Brighton contract at $5.96 for furnace and $6.84 for egg. **D. Doherty Co.** was awarded part of the Dorchester contract at $5.82 for furnace and $6.37 for egg. **The Brighton Coal Co.** was awarded part of the Brighton contract at $5.83 for furnace and $6.38 for egg. **The Metropolitan Coal Co.** was awarded part of the contract for the whole city at $5.94 for furnace and $6.24 for egg. **The City Fuel Co.** was also awarded a portion of this same contract at $5.70 for furnace and $6.15 for egg. Address Bus. Agt. William T. Keough, Room 801, City Hall Annex, Boston, Mass.

+No. 568—Albany, N. Y.—This contract (pp. 709, 748) has been awarded to the **Montgomery Coal Co.,** of Albany, at prices previously noted. A bond of $10,000 is required on this contract. Address Supt. William H. Storrs, Capitol Bldg., Albany, N. Y.

+No. 595—Hartford—This contract (p. 750), which provides for furnishing the State Capitol with anthracite coal, has been awarded to **W. C. Mason & Co., Inc.,** Address Comptroller Morris C. Webster, State Capitol, Hartford, Conn.

Contract Notes

Lawrence, Mass.—Theberge Bros., Lawrence, Mass., has been awarded a contract for supplying the Water Department at this place with 1300 tons of New River coal at $4.93 per ton.

Rochester, N. Y.—Press reports state that bids were recently opened for furnishing the county institutions with a large quantity of coal. Address the Monroe County Building Commission.

Clinton, Mass.—The contract for furnishing the local school department with about 400 tons of egg coal and 70 tons of broken coal has been awarded to **Connery Bros.** at $7.65 for egg and $7.45 for broken coal. Other bidders on this contract were as follows: Charles Frazer & Sons, egg, $7.71, broken, $7.47; Consolidated Ice & Coal Co., egg, $7.81, broken, $7.56; Philbin Bros., egg, $7.76, broken, $7.56. Address Board of Education, Clinton, Mass.

Fall River, Mass.—The American Printing Co. closed its contract for about 75,000 tons to the Chesapeake & Ohio Coal Agency Co., on New River coal.

Boston, Mass.—The Central New England Ry., subsidiary to the N. Y., N. H. & H. R.R., closed its annual contract, 150,000 tons locomotive coal, to the New England Coal & Coke Co., on Federal Coal & Coke Co.'s (W. Va.) gas coal.

St. Louis—An unusual development at this season of the year is the call from Mississippi River points south, for all-rail Illinois coal. This is accounted for by low water in the Ohio River and tributaries, which is the lowest in fifty years. No coal has come down the Ohio for the south since Feb. 20, and millions of bushels are held in barges, awaiting high water.

VOLUME 7 MAY 8, 1915 NUMBER 19

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

FOREWORD—WHAT IS A COAL-MINE SUPERINTENDENT? *Page* 797

A defense of the mine superintendent who is so often the object of unjustified criticism on the part of uninformed people.

*A KENTUCKY MINING SUCCESS: *Pages* 798-799

Details of a plant that embodies in its construction ideas that are really new and to some extent original. Everything is automatic that can be made so at present. Something about Mr. Petersen, the designer. J. E. Butler. COAL AGE, Vol. 7.

POWDER MAGAZINES: *Page* 799

THE PURCHASE OF COAL: *Pages* 800-801

Some factors which ought to be considered by the consumer when purchasing coal. Morgan B. Smith. COAL AGE, Vol. 7.

EXTRACTS FROM A SUPERINTENDENT'S DIARY: *Page* 801

SNAPSHOTS IN COAL MINING: *Page* 802

Miscellaneous views of surface and underground equipment.

*DEVELOPMENT OF A CIRCUIT CONTROLLER: *Pages* 803-805

The primary conception of a circuit-breaker is that it should interrupt the circuit whenever the amount of current becomes excessive. This article describes an instrument which performs the function of a circuit-breaker and also closes the circuit as soon as conditions have again become normal. A. R. Anderson. COAL AGE, Vol. 7.

INDIANA COAL OPERATORS SEEK AID IN WASHINGTON: *Pages* 806-807

Several communications which indicate steps being taken by the bituminous men of Indiana, who are endeavoring to find a way out of their present unsatisfactory business conditions. Mr. Callbreath, secretary of the American Mining Congress, acted for the operators in the matter of getting President Wilson's attention. COAL AGE, Vol. 7.

*PROBLEMS OF AN ELECTRICALLY OPERATED COAL MINE: *Pages* 807-809

RUN-OF-MINE TALKS

ON YOUR BUSINESS AND OURS

By the Business Manager

THE May issue of "Associated Advertising" contains some items that deserve reproducing on this page—look them over:—

* * *

"President Wilson, in his address, "Rules of the Game," had all business men in mind, of course, yet four rules he laid down do seem to have a special significance for advertising men. They are worth memorizing:

> *First*—Publicity; not doing anything under cover. Let's see how you are running the game!
>
> *Second*—Give full equivalent in service for the money you receive. Try to make profits proportionate to the satisfaction of the people you serve.
>
> *Third*—Have conscience in business. Try to make good according to the standards of the people we live with.
>
> *Fourth*—Have the spirit of service which puts the work you do above mere monetary consideration.

Don't they embrace all the real essentials for living a useful, profitable life?"

* * *

"Herbert N. Casson, speaking at Newcastle-On-Tyne, on the power of advertising, said the Dominion of Canada spent $70,000 advertising for new citizens in the United States in 1913 and got 140,000 settlers—fifty cents each, they cost—cheaper than chickens! He said there must be something unusual about the most effective advertisements, something to make people think, and he believed that, as a rule, it costs more not to advertise than to do so."

* * *

"Another man who will not advertise—the merchant who advertised through May and June once and did not get to go fishing all that summer."

COAL AGE

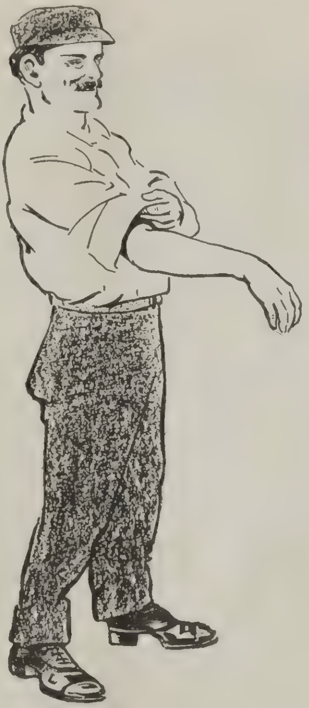
Vol. 7 NEW YORK, MAY 8, 1915 No. 19

What is a Coal-Mine Superintendent?

A coal-mine superintendent is a human being—if his salary is suddenly cut off, he might starve.

According to the reporters and the politicians he is a "hireling" of the terrible Coal Barons—whatever that (a hireling) may be or whoever they (the barons) may be—who spends most of his time tightening the shackles of industrial slavery around the common everyday people who are under him, hoping that the millionaires above him may become billionaires.

According to the "know it alls," he is the only man around a mining camp who does not have to stand an examination before receiving an appointment. If these same "know it alls" were asked to question the applicants for superintendents' positions and judge of their abilities, they (the "know it alls") would probably suddenly find that they had important business in other states.



"A coal mine superintendent is a human being . . . who keeps balky coal mines running"—which is quite contrary to the general opinion of a few prejudiced, uninformed individuals.

The shyster lawyers, in addressing juries, when superintendents are pitted against them as witnesses, refer to them as sycophantic gentlemen, with especial emphasis on the gentlemen; but their judgments should not be given very much weight, because when circumstances are such that these same lawyers have settlements to obtain that can only be obtained through superintendents they seem perfectly willing to treat with the superintendents and never question their promises.

The ladies of the camp who think that their houses need repairs or that their husbands merit promotion or better working-places look upon the superintendent as selfish and ungrateful—but their testimony is not disinterested and likewise should be given little weight.

When a group of mines are consolidated and a mine foreman assumes the responsibilities formerly carried by a superintendent in their camp, the ladies flood the general manager's office with petitions of protest assuring him that they won't live in a camp that can't afford a superintendent.

The directors of a company believe that the superintendent is the stumbling-block that robs them of all their dividends. He is always, according to them, springing some welfare work or liability fund or pension allowance to absorb every last cent of surplus, and not satisfied with that, he insists that an appropriation or two must be allowed for improvements if he is to compete with his neighbors.

To his family the superintendent is a man who has his mind on his work 24 hours in every day. Between attempting to prevent things that might happen and trying to correct things that have already happened, he has little time for himself or the family. While the rest of the community is discussing gardens and clothes he is telling his family about the gas feeder in the "9th right" or the commutator that went bad at the pump station.

Why do we want coal-mine superintendents anyway?

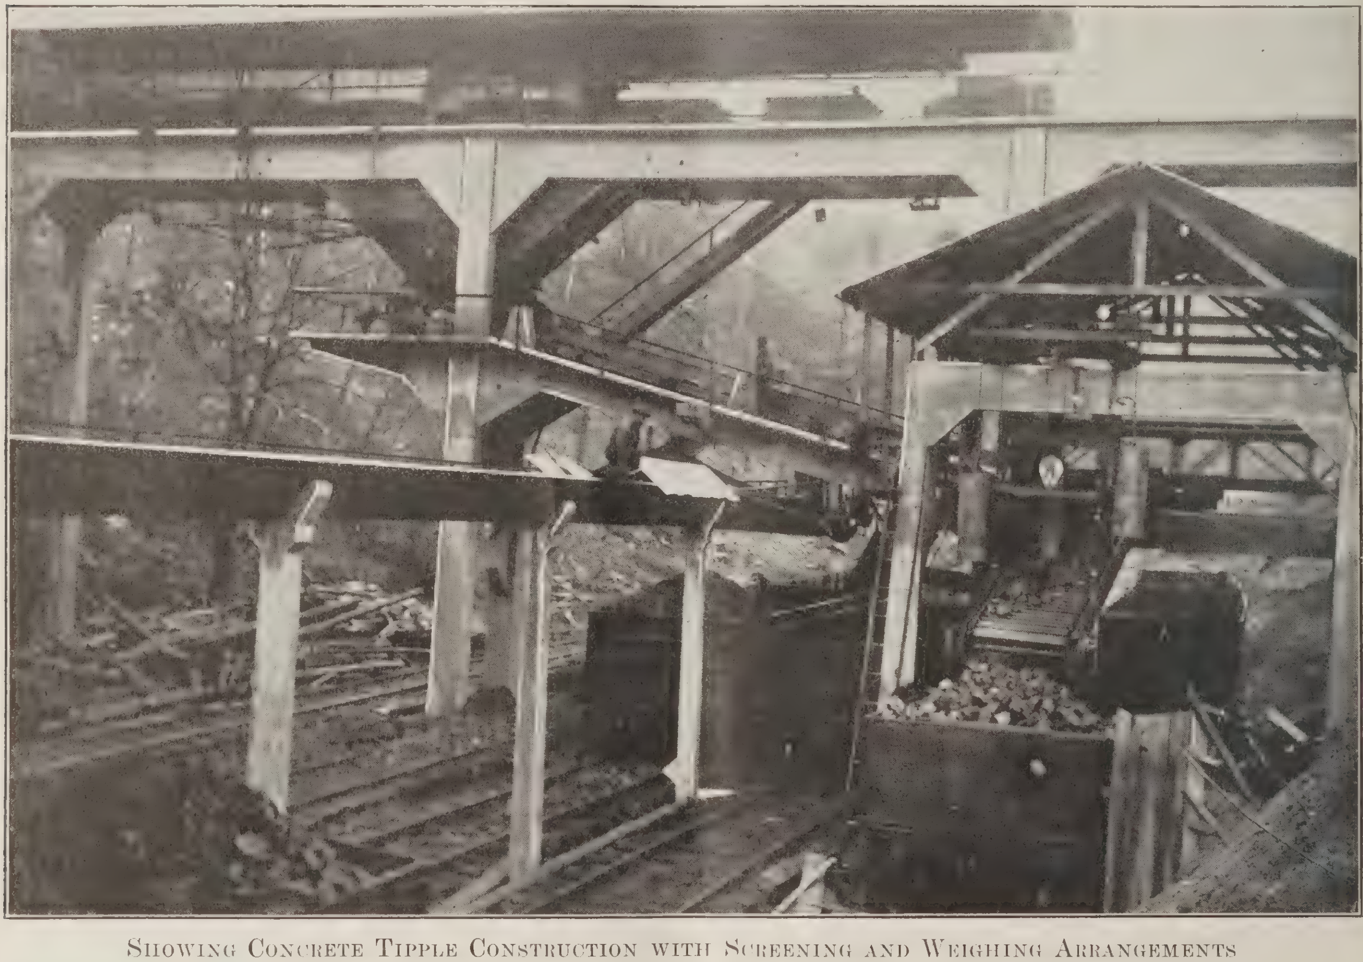
Because they are the fellows who keep balky mines running and incidentally make it possible for most of their critics to earn a living.

A Kentucky Mining Success

By J. E. Butler*

SYNOPSIS—Details of a plant that embodies in its construction ideas that are really new and to some extent original. Everything is automatic that can at present be made so. Something about Mr. Petersen, the designer.

The greatest prospective coal-mining success that I have seen this year is at Hazard, Ky. It is the equipment of a mine for the Ashless Coal Co. furnished by O. G. Petersen, of the Associated Engineering Co. I say "prospective success," for many of the ideas embodied are new to coal-mining practice and will have to be adapted to the work. Management and engineering skill will have much to do with the final result. Assuming that the proposed plans will work out as designed, some economies of a radical nature will have been secured. We often hear the term "modern equipment" applied to coal plants, and in this instance the expression seems to fit.



Showing Concrete Tipple Construction with Screening and Weighing Arrangements

The surface structures, classic in appearance, are of reinforced concrete. The power plant is a marvel of neatness and compactness and is equipped with two 150-hp. return-tubular boilers with steel jackets and one 200-kw. Curtiss turbine, occupying one open room in a building of neat design. The fuel is received directly from the tipple screens on a cable conveyor, which delivers it to the boiler-house bins, immediately behind the oven doors. Only one operative is required in this plant.

In addition to the power plant the mine equipment embraces several noteworthy features. The undercutting chain machines furnished by the Sullivan Machinery Co. have General Electric alternating-current motors, operating at 440 volts. This change from the direct current will permit extensive development without excessive copper-wire costs.

Storage-Battery Locomotives

Haulage power is furnished by storage-battery locomotives of General Electric construction. The absence of a network of dangerous overhead trolley wires is noted with satisfaction as is also the absence of bonds. With the present service the locomotives will run 14 hr. without recharging. The recharging is done in about 7 hr. at night and serves to distribute the load on the power plant.

The Streeter-Amet automatic scales of 20-ton capacity are used. There are two platforms accommodating loads from each side of the mountain, connected to one beam or recording device. This feature eliminates the disputes regarding weights between miner and company. The load passes over the scale, and the recording device does the rest.

---

*General manager, Stearns Coal & Lumber Co., Stearns, Ky.

The mine cars were built by the Sanford-Day Iron Works, of Knoxville, according to plans furnished by Mr. Petersen. Dumping of coal is brought about by a trip which automatically releases the bottom fasteners, and the coal slides out of the car into a 30-ton steel hopper. The bottoms in turn are closed and secured automatically by idler pulleys in the floor of the tipple, over which the car is hauled as soon as it is unloaded. This bottom dumping feature will undoubtedly excite the criticism of car builders throughout the country, and it will be interesting to see if the arrangement will stand up under service.

The tipple is really a bridge some 40 ft. high by 400 ft. long spanning a narrow valley, on each side of which, at tipple height, are the mine openings. The massive beams and columns of concrete are not without architectural beauty and show up in striking contrast to the jumble of wood and machinery which usually passes for a tipple. This structure spans four tracks, providing for that number of grades of coal at one operation, and supports the scales, receiving hopper, screens and loading boom. The box-car loader is on a separate pedestal.

How the Coal Is Handled

With the aid of these and other features the coal is handled with great facility. It is undercut, shot, loaded in the car and pushed to the room parting by the miner. The motorman and trip-rider with the storage-battery locomotive gather the cars into trips and haul them to the tipple, where without delay, interruption or any assistance, the coal is automatically weighed and dumped and the car bottoms are closed and made secure. The train then passes on into the opposite side of the mine as an empty trip.

At the bottom of the receiving hopper is a feeder plate which delivers the coal gradually to the shaker screen. The screens are 40 ft. in length by 5 ft. in width, giving ample screening capacity. They are driven by a geared motor, and have the short pendulum swing peculiar to Petersen installations. The lump coal is delivered to a loading boom, which has a horizontal table for slate-picking purposes, and continuous with this is an incline conveyor which lowers the coal without breakage into the railway car. This boom may be hoisted or lowered at the will of the operator so that coal may be discharged at any level desired in the gondola car, or the whole boom may be moved laterally so as to bring the discharge end opposite a box-car door for box-car loading.

The railway cars are controlled from the screen floor of the tipple by means of car retarders of ample capacity. The builders intend that but three men shall be required to operate the tipple; namely, one on the deck floor to supervise the unloading and the scales, one on the screening floor to control by means of switches and levers the screens and the loading boom and the car retarders and one on the ground to take care of the railway cars.

One has only to review the main features of this installation—namely, the alternating-current coal-cutting machines, the storage-battery locomotives, the automatic scales, the automatic dumping of cars, the car retarders with boom and screen controlled by single operator, the delivery of coal to the power house and the simplicity of the power unit—and compare them with the ordinary coal-mining outfit to appreciate that there are here combined more features tending to economy of operation than are usually found in American plants.

The designer of this plant is Oluf G. Petersen, president of the Associated Engineering Co. Mr. Petersen was born of Danish and German parentage in Erie, Penn., in 1876. His forefathers were pipe-organ builders, and he retains the instincts of his forbears—he is a builder. As a boy he amused himself building miniature telephones, repairing old gasoline engines and setting up marvelous electrical installations. He knows machines as a mother knows her babe. He has nursed them in his bosom, cried over them, fondled them, fought for them and bled for them. While rearing machines of various kinds, incidentally he completed a course in mechanical engineering in Michigan University at Ann Arbor, which place was at that time his home. His knowledge of machines and other less important things secured him a position on leaving college at the Ishpeming High School, where he spent a couple of years teaching the young men how to work with their hands, use tools and run machines; in other words, he gave the boys manual training. He continued this work for several years at Milwaukee, Wis., both in schools and in shops. At the end of that time he took a position as engineer for the Stearns Coal & Lumber Co. and the Kentucky & Tennessee Ry., at Stearns, Ky. After building for these companies the first motor-driven sawmill in the United States and the first tipple entirely of concrete to use shaker screens, he resigned to organize the Associated Engineering Co. for the purpose of giving exclusive attention to the building of surface equipment for coal mines.

Mr. Petersen has given special attention to handling coal on the surface and has secured a list of patents covering the bottom-dumping cars, adjustable screens, a movable loading boom, an automatic tipping and closing device for the bottom-dumping cars, a box-car loader and a spiral block coal loader, all of which are destined to reduce the cost and improve the quality of prepared coal.

⁂

Powder Magazines

A dugout in the side of a hill is often considered a good place in which to store explosives. This, however, is a mistake, and such a magazine is ultimately an expensive one, because the efficiency of the explosive, on account of its moisture-absorbing properties, falls off very rapidly when the powder is stored underground. Powder magazines should be constructed, and for this a good material is brick. Stone or concrete or similar materials—which in the event of an explosion would be converted into projectiles and would do damage to surrounding property—should not be used. Brick is pulverized into dust by a dynamite explosion and does no harm.

Powder magazines should have bullet-proof doors, and where this is not feasible the doorways should be protected by a screen or barricade. It is advisable to surround the entire magazine with a similar barrier. It requires 11 in. of sand to stop a bullet fired at ordinary range from a modern high-power rifle using smokeless powder, such as is occasionally used now by hunters.

As has often been suggested before, to sink the entire building behind a heavy earthen parapet is the safest method. Then anything which can be converted into a projectile by an explosion must travel with a high trajectory in order to do any damage, which is much safer for the surroundings than if the magazine were in point-blank range.—From *Engineering News*.

The Purchase of Coal

By Morgan B. Smith

SYNOPSIS—Some factors which ought to be considered by the consumer when purchasing coal.

In connection with the purchase of coal two questions arise, both of which may seem odd but which nevertheless bring forward intensely practical answers. The first is, *Why* does the consumer purchase coal? and the second, *How* does the consumer purchase coal? The first question may be answered by the simple statement that the coal is bought for heating purposes. This answer is ready and straight to the point; but how about the second question—can this be answered as readily as the first? Unless the purchaser has been through the mill thoroughly he will state that he buys coal from his dealer at so much per ton, plus freight charges, and then puts it in storage in field or bunkers or perhaps burns it at once in the furnaces.

It is worth while to consider the answer to the second question. There is more involved in the purchase than mere tonnage. The purchaser himself admits that it is heating value which he desires. Therefore, he should look for heating value per ton of coal bought and also for nonheating properties in the coal.

Stop to consider, then, some of the factors to which the consumer ought to give attention when purchasing coal for his plant. In the first place, he is forced by current practice to buy "tons of coal," regardless of the true value to him, unless he is in a position to insist upon "heating value per ton of coal."

What does this mean to the consumer? It means that he is paying for mere weight of coal, for freight on mere tons, for handling at the plant of mere tons, for crushing mere weight, for storage of weight only, for burning weight only and for handling ashes—all based upon mere avoirdupois rather than upon heat value. Is this common sense or good judgment? Hardly.

Supposing that he is in a position to insist upon heating value in every ton of coal which he purchases, and to make his insistence strong by means of the proper tests on all coal received at the plant. What then? The purchase of coal then becomes a matter, not of mere tons, but of heat units per ton or per pound, a measure of the coal's real value.

When the purchaser has reached this position regarding coal, he can then go ahead and by comparative tests select the coal best suited to his plant equipment. That coal which is by its characteristics best adapted to the conditions of the plant and the load is the highest grade usable, regardless of cost.

It is customary to state the heat value of coal in terms of heat units per unit of weight, generally stated as British thermal units per pound (B.t.u. per lb.) based on the sample dried at 105 deg. C. for one hour. Unless the exact characteristics of the coal are known, a pound of it may have diverse meanings to the buyer. To make this clear, the accompanying diagram has been made to illustrate graphically how "one pound of coal" may have great significance when all costs and efficiency in the plant are considered.

Assume the intial cost at the mines to be the same for each of the five coals shown. How much of the total cost is productive? Only that portion represented by the heat content of the coal purchased. How much of the total cost is loss? The difference between the total cost and the productive cost. The content of fixed carbon and volatile matter is a measure of the productive cost, whereas the ash content is the nonproductive cost. Which is wanted, heat value or ash?

Diverse Meanings of One Pound of Coal to Consumer

No. 1 coal is a purely hypothetical coal, not found in nature, but shown here for the sake of comparison only. Coals Nos. 2 to 5 are representative of coals on the market and show a common range of characteristics. Which of these coals will give the best results in cost and efficiency in the plant, from mines to bunkers and ultimately to the ash dump? Does storage value mean anything when, through strikes at the mines or stoppage of transportation by floods, the plant is threatened with a shutdown? If so, which of the four coals would it be preferable to have the bunkers or field filled with in such emergency?

The cost does not stop with the original price per ton plus freight, for handling, crushing, storing charges on the coal and also handling of the resultant ash must still be covered. It is generally conceded that coal high in ash and sulphur is harder on all handling apparatus than a coal of lower ash and sulphur content. The costs for upkeep of apparatus will then be in proportion to the wear and tear upon such equipment. In the furnaces evolution of heat is the desired output and will vary directly with the heat content of the coal used. The higher the heat value, the greater the amount of heat liberated, all other conditions being similar. Finally there are the charges for handling the ashes produced.

In general, it may be said that the higher the quality of coal which the plant will handle economically, the lower will be the cost and the greater the efficiency of the plant. It is not necessary that the dealer be held to a strict specification of properties of the coal purchased, although it is wise for the purchaser to acquaint himself with such characteristics and for his own satisfaction formulate a specified analysis. He will find that daily tests on all coal received at the plant, or possibly weekly averages, will afford him valuable data, and if he sends copies of all such tests to his dealer, he will find himself possessed of powerful ammunition with which to convince the dealer that it is to his interests, as well as those of the purchaser, to furnish the coal desired. Such an arrangement tends toward mutual satisfaction since it places both parties to the contract on an equitable footing.

The tests which should be made regularly are those to determine the heat value per pound of coal as fired, ash content as fired and percentage of sulphur. These tests give all the required data. Other tests may be made, often of value to the consumer, such as the determination of fixed carbon and volatile matter. Moisture must always be determined in order to calculate the coal to the condition "as fired" or net weight of coal burned. These are simple tests, and the apparatus is not expensive when the results are considered. By all means adopt the oxygen-bomb type of calorimeter for determining the heat value of coal. Other calorimeters are at best only approximate in their results, although cheaper in first cost.

The purpose has been to point out the real meaning of "coal" to the purchaser and consumer and to emphasize the fact that only by knowing the fuel can the user reach that degree of standardization in his fuel purchase and combustion which has been the real factor in producing the high efficiency of the modern power plant. It is a fact that uniform fuel means uniform and economical operation in the plant.

⁂

Extracts from a Superintendent's Diary

Today we had an unusual visitor, an authoress who is touring the entire country in search of material for her next book—a short, rather stout, middle-aged woman, with kindly eyes and a captivating smile. She carried no letters of introduction and needed none.

In recalling the interview I had with her, I realize that she was an interviewer of the highest ability. Even while explaining to me her mission in our camp, she did not monopolize the conversation, but encouraged me to do a good deal of talking; and I managed to tell her that I also aspired to literary distinction, and as an initial step several years back I began an elaborate diary, which I have religiously continued to this day.

My confession pleased her very much. She was not in search of adventures, but rather of intimate pen pictures, covering all trades and industries; and she felt sure that any one who philosophized over his lifework with enough seriousness to make diary entries would be able to recall many gripping scenes—that is the way she put it.

She had met many big men connected with various industries, but almost without exception they could talk interestingly only when allowed to suggest that the industry with which they happened to be connected was the keystone to all industry.

Getting personal, she assured me that, had she omitted to forewarn me, I would have seized the first opportunity to explain that if all coal mines were suddenly blown up or rendered useless, all industry on the face of the globe would be paralyzed; how could ships travel, trains move and factories operate then? "And with a very little encouragement," she continued, "the picture of the coal-mining industry that you might suggest for me would become so magnificent that I might feel that little else in the world really counted."

"Even at that," I replied, "I might not be overrating as much as you suspect."

Foolish man! That was exactly the reply she most desired; she admitted as much when she was taking leave. Experience had taught her that men hold nothing back once they find themselves on the defensive, and in recalling what followed, her method seems almost uncanny. If she publishes all that I told her, my diary to date will have been published. But I have some consolation in the fact that she was made to realize that the terrible coal baron gets credit for many things that properly belong to others.

I happened to relate a little adventure staged in a New York tenement during the past winter. A college friend of mine who had given up a business career to enter social-settlement work had induced me to make a trip with him through some New York tenements, hoping that I might absorb a proper feeling for the "down and outs" of this world, as he expressed it.

The day was extremely cold, and in all of the rooms where we gained admittance the occupants seemed to be mostly occupied in trying to keep warm by huddling around small stoves or grates in which burned a few precious coals.

The climax was reached when we entered a room where a mother was weeping over a child lying stiff in death, frozen because the few lumps of coal, bought with the mother's last pennies, proved to be mostly slate and bone.

"What a reflection on the coal-mining industry," said my friend.

I didn't let it rest there. My friend knows now, and the authoress realizes also, that the average coal-mine owner has about as much control over the prices and practices of the coal peddlers in distant cities as does a cow over the milk peddler who sells water for milk.

⁂

Some Cause for Complaint

The following was found at a certain mine on the bulletin board where machine-runners mark up their troubles:

"No. 4 Masheen awl Shot tu hel. Chain brok. fix the dam thing. it brok twist Last nite. needs new rear staff leaves for resisting box. amatoor smokes like heltoo. Power bad. lots of short circles. this is the masheen with self compeller truck. Wer outa oil tu."

Development of a Circuit Controller

By A. R. Anderson*

SYNOPSIS—The primary conception of a circuit-breaker is that it should interrupt the circuit whenever the amount of current becomes excessive. This article describes an instrument which not only performs the function of a circuit-breaker, but closes the circuit as soon as conditions have again become normal.

In practically all systems involving the generation and utilization of power there are to be found protective devices of some kind. The original conception of such a contrivance seems to have been that it should protect the apparatus from abnormal conditions in the nature of overloads. But there is another element in a system involving the generation and utilization of power which needs protection, and the abuse of which may prove quite as costly as the abuse of apparatus. This element is service.

Referring specifically to electrical systems using protective devices in the form of circuit-breakers, it is quite as important that the service be resumed promptly upon the disappearance of abnormal conditions as that it be interrupted upon their appearance. Were abnormal conditions to come about comparatively slowly it would be possible for an operator to sense them and interrupt the circuit before damage could be done. But generally these conditions occur so quickly that it is absolutely necessary to provide automatic means, quicker than the human eye or hand, for interrupting the circuit.

This function of a protective device therefore has always been evident. The other function of responding instantly to a return to normal conditions as well as a departure therefrom and thus protecting the service has been given comparatively little thought. Its importance has perhaps been overlooked because this function can be accomplished by hand.

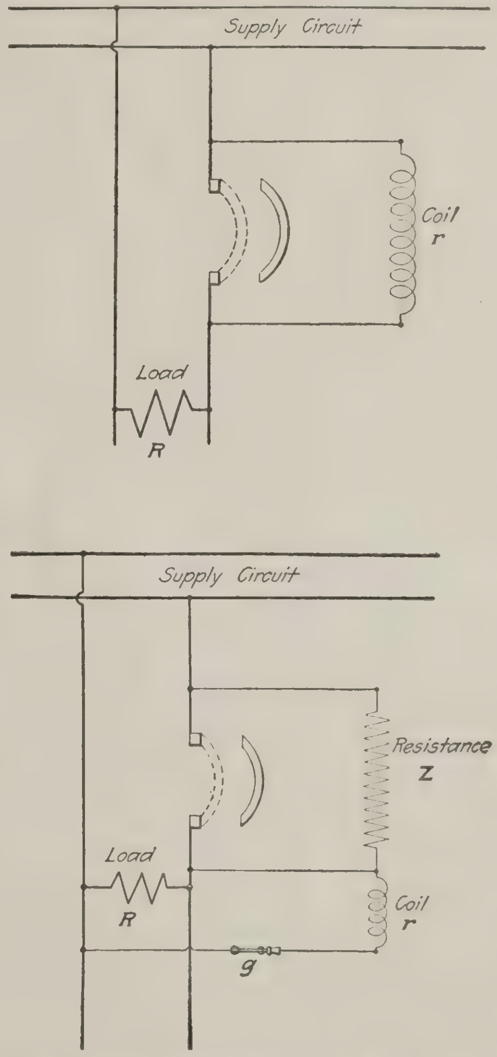
In large distribution systems with many generating units and much auxiliary apparatus tied together in a complete network, there are so many elements influencing the restoration to normal conditions after a circuit has been interrupted that it is hard to conceive of an apparatus that will supplant human intelligence in directing this restoration. But in simple direct-current distributing systems such as are used in practically all coal mines and in all feeder circuits taken directly from the main busbars the function of restoring service instantly upon the return of normal line conditions may be accomplished by the use of automatic circuit controllers.

The automatic circuit controller made by the Automatic Reclosing Circuit Breaker Co., Columbus, Ohio, is essentially a solenoid-operated circuit-breaker which is opened on overload by a plunger actuated by a coil in series with the load and tripping open the circuit which energizes the operating solenoid. After opening the circuit the operating solenoid cannot again be closed until a contact in the circuit is closed by the plunger of an auxiliary coil called a trip coil.

The operation of the plunger in the trip coil is dependent upon the load resistance. The plunger will therefore not operate until the resistance of the load has increased to a point where the value of current that will flow upon closing the breaker will not exceed full load. At any value of load resistance above this the breaker will close automatically, opening only on overload and staying open only so long as this overload condition remains.

A Brief History of the Development of the Controller

The electrical circuits of the automatic circuit controller may best be understood through a brief history of their development. The first idea for the operation of the trip coil which presented itself to E. C. Raney, the inventor of the automatic circuit controller, was to shunt the trip coil around the breaker when opened so that a certain "index" current would traverse this coil through the short-circuit or decreased load resistance to the other side of the line. The current through the trip coil would



Figs. 1 and 2. Successive Steps in the Development of the Apparatus hold the plunger up until a sufficient increase in the load resistance would decrease the index current, allowing the plunger to drop and close the circuit through the operating solenoid.

---

*Electrical engineer, Columbus, Ohio.

The electrical circuits for such a device are shown in Fig. 1. The objections to this arrangement, however, are the high value of index current required for even a theoretically appreciable variation in it due to change in load resistance, the interference of voltage variation within commercial limits with the determination of a point of operation fixed with reference to the load resistance, and the erratic performance of an iron-core solenoid on decreasing current, the point of release depending on the previous degree of magnetization as well as the value of current flowing through the solenoid.

A concrete example will serve to illustrate difficulties with this arrangement. Assume a circuit supplied from a 250-volt, 150-kw. generator. The breaker in this circuit is set at 800 amp. The minimum value of load resistance R on which the breaker will stay closed is therefore $\frac{250}{800} = 0.312$ ohm. Suppose there are constant loads such as lights, etc., on the line to the amount of 100 amp. This is equivalent to a load resistance of 2.5 ohms, and when the breaker has opened, the load resistance cannot be expected to rise above this value to operate the trip coil which closes the circuit through the operating coil.

The trip coil must be sufficiently sensitive to respond to a variation in load resistance from a value of 0.312 ohm to a value between 0.312 ohm and 2.5 ohms. Let it be assumed that the resistance r of the trip coil is 10 ohms. Then when the overload occurs the resistance of the trip coil and load is $(r + R)$, or 10.312 ohms, and the current which flows with 250 volts at the generator is 24.2 amperes.

On this value of current the coil must not operate, but must hold until the value of current has dropped below it. The minimum value to which the current may drop is obtained when the load resistance increases to 2.5 ohms and is $\frac{250}{12.5} = 20$ amperes.

The maximum drop in current obtained by this means with constant voltage is only 17 per cent. and the practical difficulty of obtaining reliable operation of the trip coil with so small a variation in current is at once evident. Add to this the possibility of the line voltage varying this much, especially if the breaker is connected to a supply circuit at some distance from the power house and the considerable value of index current which must be handled and the difficulties connected with this arrangement for practical apparatus are apparent.

The Instrument Was More Sensitive with Increasing Currents

In experimenting with this type of circuit, however, it was noticed that the trip coil responded more readily and at a more definite point with an increasing than with a decreasing current. This led to the idea of connecting the load circuit and trip coil in parallel around the open breaker, using an auxiliary resistance to keep down the value of index current. This arrangement of circuits is shown in Fig. 2, where R is the load resistance, r the resistance of the trip coil, and Z is the auxiliary resistance.

The resistance of the trip coil r approximates R or that of the load, while the resistance Z is comparatively high. Attention is called to the fact that the trip coil having approximately the resistance of the load circuit may not be left connected in when the breaker is closed, as it would constitute practically a short-circuit across the line. Mechanical means are therefore provided for opening this circuit before the breaker closes.

Evidently with this arrangement the current through the trip coil with constant resistance r increases with an increase of the load resistance R. But this arrangement affords another advantage in point of sensibility and which is in reality the keynote to the practical success of this breaker.

An example will illustrate: The same generator and load conditions as above are assumed. In this arrangement, however, the resistance of the trip coil r is 1 ohm and the resistance Z is 125 ohms. With 250 volts on the line and load resistance of 0.312 ohm, the following currents are flowing after the breaker has opened: Through Z, 2 amp.; through R, 1.52 amp.; through r, 0.48 amp. After the load resistance has increased to 2.5 ohms, the following currents are flowing: Through Z, 1.99 amp.; through R, 0.57 amp.; through r, 1.42 amp.

FIG. 3. THEORETICAL DIAGRAM OF ELECTRICAL CIRCUITS

The increase of current through the trip coil has been 195 per cent., as compared to a decrease of only 17 per cent. in the previous arrangement, and the index current which the apparatus has to handle does not exceed 2 amp., as compared to over 24 amp. in the previous arrangement. This feature of the divided circuit is the very heart or rather brains of the machine, for it gives it the sensibility in responding to the changes in load resistance necessary to make its practical operation successful.

A complete theoretical diagram of the electrical circuits of a single controller is shown in Fig. 3. The main contact brush is moved to the closed position and held closed by the operating coil which is connected across the line through the contact b. When an overload occurs the plunger in the series coil rises and opens the contact at b, which is held open by the latch c. The breaker will close again only when the trip coil is energized sufficiently to raise its plunger and kick out the latch c.

The trip coil is connected around the breaker through the bridge g to the opposite side of the line. It is thus in parallel with the short-circuit and the combined current through the trip coil and short-circuit is kept down to about 2 amp. by the resistance tubes shown. The bridge is supported by the piston of a dash pot, which descends slowly at a predetermined rate, which may be adjusted from 1 to 40 sec. The trip coil cannot operate and cause the breaker to close until this bridge is down, no matter what the condition of the load circuit may be.

The object of introducing this time element is to allow sufficient time for motors to come to rest and starting-box levers to return to starting position before the breaker closes. After the bridge *g* is down the breaker will close, provided the overload condition of the line has disappeared; that is, provided the load resistance has increased above the full-load value, thereby diverting sufficient current through the trip coil to operate its plunger.

If, however, the load resistance is still below full-load value, enough of the index current to operate the trip coil will not traverse it and so the breaker will remain open. When the load resistance increases to the proper value the trip coil operates, the operating coil is energized, the plunger therein rises, raising at the same time the piston of the dash pot and lifting the bridge off the contacts at *g*, and finally closing the main contact brush. Thus it is seen how the trip-coil circuit is open before the main circuit through the breaker is closed and the possibility of the trip-coil circuit forming a short across the line precluded.

THIS BREAKER IS NOT ADAPTED TO GENERATORS IN PARALLEL

From the above considerations it may be easily seen that a breaker as described may not be used where the load side is supplied from sources of power other than through the breaker in question. In other words, a breaker as described may not be used in the circuits of generators operating in parallel and feeding into the same busbars or network without some modification.

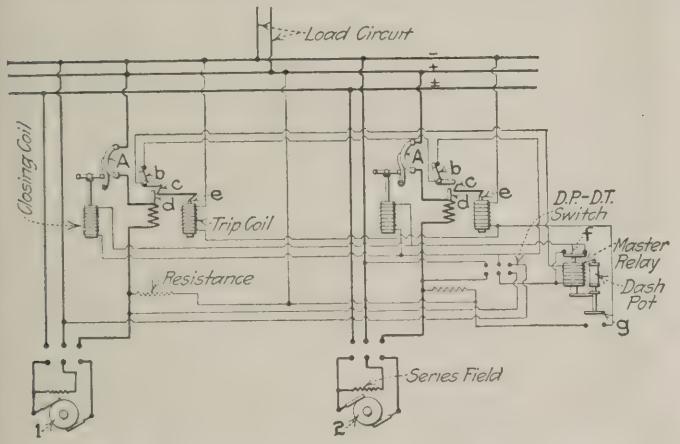

FIG. 4. ELECTRICAL CONNECTIONS FOR TWO GENERATORS IN PARALLEL

The modifications necessary in order to adapt the breaker to the circuits of generators operating in parallel have been worked out and the theoretical diagram of the electrical circuits of such an arrangement for two generators so operating and feeding into the same busbars is shown in Fig. 4. The modification consists essentially in removing the dash pot and bridge from the individual breaker, using only one dash pot for all the breakers and operating it by means of a master relay.

In this arrangement the contacts *b*, connected in series, are placed in the circuit of the master relay instead of that of the operating coil as in a single breaker, and the master relay at the point *f* controls the circuit through the operating coils of the breakers which are connected in parallel. The trip coils are also similarly connected and the circuit through them is closed by the single bridge *g*. Fig. 4 shows the breakers in the closed position.

In the case of an overload on either generator, one of the contacts at *b* is opened by the plunger *d* of the series coil in the same manner as in a single breaker. This opens the circuit through the master relay, the plunger of which drops and opens the contacts at *f*, thereby opening the circuit through all the operating coils and causing all the breakers to open.

After a certain time limit, depending upon the adjustment of the dash pot, the bridge *g* is closed and the trip coils will operate to release the latches *c*, provided the load resistance has increased to the proper value. When the latches are released, all open contacts at *b* are closed, throwing the master relay across the line, lifting the bridge *g* and closing the circuit through all the operating coils at *f*, thus closing all the breakers. Regardless of whether the overload occurs on one or all the generators, all the breakers open simultaneously and close simultaneously.

By means of a suitable switch, the master relay may be excited from either generator desired. Any generator and its circuit-breaker may be operated independently by opening the operating coil circuit and trip-coil circuit of the other breakers by means of switches provided for that purpose.

CONTROLLING THE DIRECT-CURRENT CIRCUITS

Automatic circuit controllers fulfill the four functions necessary for the complete control of direct-current circuits with reference to overload conditions:

1. They interrupt the current quickly in case of short-circuit or overload.
2. They permit of a certain time to elapse after the circuit is opened before it is again closed, regardless of whether the short-circuit has disappeared or not. This protects motors and similar apparatus on the line.
3. They will not close the circuit while the short-circuit still exists.
4. They close the circuit instantly upon the removal of the short-circuit, after the time limit has expired.

Many fields of application for these breakers will suggest themselves. With increased use of purchased power, the automatic control of the direct-current side of motor-generator sets and rotary converters presents a large field where they may be profitably employed. Their use generally dispenses with the continuous services of an attendant at substations and avoids unnecessary delays incidental to closing a manually operated breaker. Their installation on branch circuits serves to localize troubles and avoid shutting down the entire system. About mines and mills especially installations of this kind possess marked economic advantages.

In general, automatic circuit controllers not only protect apparatus and service, thereby insuring maximum output and a minimum overhead expense per unit of production, but also present the opportunity of reducing operating cost.

⁂

Electrical resistance varies greatly with different metals, and is in general less for a pure metal than for any of its alloys. Its value in every case depends upon the length of the wire, its cross-sectional area, and the nature or chemical composition of the metal, all of which vary with temperature. Increasing or decreasing the length of any conductor will increase or decrease the resistance in direct proportion. Increasing or decreasing the cross-sectional area will inversely affect resistance; that is, as the section of the conductor increases, the resistance becomes proportionately less and vice versa.

Indiana Coal Operators Seek Aid in Washington

The communications below indicate steps being taken by the bituminous coal men of Indiana, who are endeavoring to find a way out of their present unsatisfactory business conditions. Mr. Callbreath, secretary of the American Mining Congress, acted for the operators in the matter of getting President Wilson's attention. The exchange of letters and the statement of the operators follow:

Hon. Woodrow Wilson, President of the United States,
White House, Washington, D. C.

My dear Mr. President: At the request of a committee of Indiana coal operators, who were unable to present this to you personally because of your absence from the city on Tuesday, I beg to present to you a statement concerning the bituminous coal mining industry.

This committee consisted of Messrs. Carl Scholz, president of the Consolidated Indiana Coal Co.; Walter S. Bogle, of W. S. Bogle & Co.; John T. Connery, president of the Miami Coal Mining Co.; J. C. Kolsem, of the Jackson Hill Coal & Coke Co.; Hugh Shirkie, of the Shirkie Coal Co., and Morton L. Gould, of the Gould Coal Washing & Mining Co.

Will you permit me first to present a few general statements concerning the bituminous coal-mining industry at large as a preliminary to the more concise reference to the Indiana situation?

First, more than 500,000 workmen engaged in the bituminous coal industry are necessarily idle more than 100 days each year.

Second, more than $900,000,000 of the capital engaged in the bituminous coal industry is idle more than 100 days each year.

Third, approximately 200,000,000 tons of the nation's fuel supply is being wasted each year.

Fourth, about 100,000 acres of coal lands are being exhausted each year, while with proper conservation 65,000 acres could be made to furnish the fuel now used by the nation.

For the last five years the average selling price of bituminous coal at the mine has approximated $1.12 per ton, while the cost of labor and supplies for each ton produced has approximated 96c., leaving but 16c. per ton to pay for the mine, the depreciation of machinery, selling charges, overhead expenses and the risk which always exists of a mine disaster through which the whole capital involved in the enterprise might be destroyed.

The Indiana committee presented this matter to the Federal Trade Commission, believing it had authority to permit such coöperation between the operators as would enable them to partly relieve this situation. I attach hereto a condensation of the statement made to the Federal Trade Commission. The commission expressed full sympathy and its desire to lend any possible assistance, but stated that under the law it had no authority to take any affirmative action in the premises.

The same statements were presented to the Department of Justice, able to punish in case the proposed plan of coöperation to stop the waste should in any way transgress the law, but that department was unable to give guiding advice.

The Indiana operators believe that this enormous waste of the nation's fuel supply is of sufficient public importance to justify an appeal to you as the President of the nation to lend a helping hand through such agencies as may be available. Respectfully submitted,

J. F. Callbreath,
Secretary.

Statement of the Indiana Operators

The Indiana bituminous coal operators find themselves suffering from overproduction and intense, unrestrained competition, with the result that a number of the operators have been forced into the hands of receivers, and a large number of the balance are suffering seriously from the situation.

The condition affects the laborer equally with the operator, because of intermittent work. During the year 1914 they secured only 148 working-days. The result is the entire absence of conservation. On the contrary, it promotes a waste of coal in the ground because it requires the cheapest and easiest method of getting coal out, to meet the price at which it has to be sold. On a conservative estimate not more than 50 per cent. of the coal is recovered.

This means that in the United States as a whole upward of 200,000,000 tons of coal are wasted each year.

There are 114 companies in the State of Indiana producing 16,000,000 tons of coal each year—a little over 2 per cent. of the total production in the United States—and in the largest market they do not control over 16 per cent. of the tonnage of that market.

In order to hold this position, they are obliged to maintain something like 300 selling offices and 900 salesmen. The expenses in the mines are increased by the necessity of maintaining an organization that can produce the limit of the mine's capacity on 24 hr. notice.

They are competing within the boundary of their own state with the nonunion States of Kentucky and West Virginia, and the union-employee States of Ohio, Pennsylvania and Illinois. Outside of their own state they are competing with Kentucky, West Virginia, Ohio, Pennsylvania, Illinois and Iowa.

The situation is such that it is impossible for them to advance their prices, and the only method left open to them to maintain their standing in the trade is to reduce their expenses, which can only be accomplished by coöperation among them.

The tentative plan which meets with their approval consists of a single selling agency, which would decrease the selling cost several cents per ton and would enable them to standardize the business; and by intelligent distribution of orders, establishing of storage facilities for fine coal—for which there is an erratic demand—they could increase the present earnings fully 10c. per ton without in any way disturbing the present price.

The representatives of the labor element of the industry have repeatedly urged such a movement in public investigations of conditions by several of the states.

The operations of the Indiana coal-producing industry are confined to about five states and do not extend over the entire country. It is a fact that two of the large companies in other states produce and market a greater amount of coal than is produced and marketed in the State of Indiana.

We do not believe that it is the intention of the law or of the Government to force an industry into bankruptcy. On the contrary, when such a condition arises, the sentiment of the people at large is, and that of the law and the Government should be, to allow the industry involved to adopt such reasonable methods as to avoid bankruptcy and to maintain its position in the commercial world.

It is with that idea in view that they have presented the situation in detail to the Federal Trade Commission, together with a plan which they propose to inaugurate to in a measure protect themselves. The position taken by the Indiana operators is that they prefer bankruptcy to a criminal prosecution for violation of the law.

President Wilson's Reply

The White House, Washington
April 26, 1915.

My dear Mr. Callbreath: I have your letter of Apr. 22. I am sincerely sorry that it was not possible for me to see your committee personally on Tuesday last.

You may be sure that I will consult with my associates here and that, if there is any possible way in which we can help in the situation which you unfold, we shall be glad to do so. Cordially and sincerely yours,

Woodrow Wilson.

Mr. J. F. Callbreath, Secretary, American Mining Congress, Washington, D. C.

⁂

Problems of an Electrically Operated Coal Mine

By H. W. Smith*

SYNOPSIS—An explanation of why some mines show such excessive production costs. The author ran an interesting test which indicated plainly just how great were the power losses.

The writer while connected with the commercial department of a large central station operating in West Virginia, which was organized solely for the purpose of supplying power to collieries, invariably encountered mines being supplied with electrical power from a plant located at such a distance as to make economic operation prohibitive because of excessive line losses, thus greatly curtailing the output.

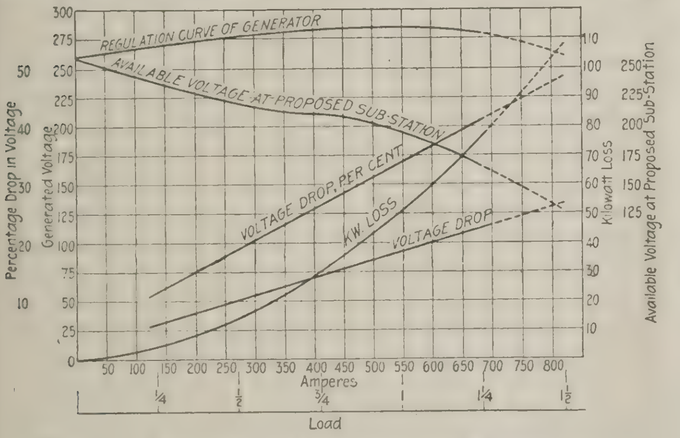

Fig. 1. Showing Graphically the Results of "Short-Circuit" Test

In the majority of cases conditions could be somewhat improved providing a reasonable amount of attention was given to the installation and maintenance of proper rails and bonds. But how much consideration does the average operator give this seemingly unimportant detail? What does he care so long as the wheels of his mining machines and locomotives turn and another armature does not burn out before sufficient time has elapsed to have the last one repaired. It never once occurs to him to ask, How much more coal could I run per day or what would be the annual saving in repairs for my motors and coal cutters if the power back at the face was from 50 to 75 volts stronger? If he did consider such matters, we would find greatly improved conditions throughout our coal fields.

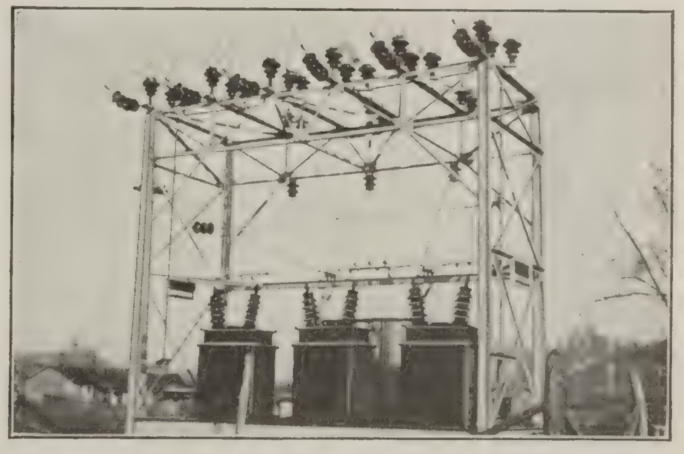

Fig. 2. Type of High-Voltage Substation Used Exclusively by the Power Company. Westinghouse Outdoor Transformers Are Shown

As the resistance of steel rails found in and around the average mine, providing suitable bonding is maintained, is only 12 times that of a corresponding cross-section of copper, it can be seen that the conductivity of the return should be as good if not better than the positive line, thus making it entirely unnecessary to run a copper circuit in parallel with the return, as is found in many cases.

---

*Engineer, Westinghouse Electric & Mfg. Co., Pittsburgh, Penn.

An Interesting Test

In order to illustrate by actual figures the losses that occur when a mine is operated from a source of power transmitted from beyond its zone of economic distribution, a description of a "short circuit" test conducted upon the power plant and transmission lines of a prospective customer is given. This test takes its name from the fact that a connection, or short circuit, is made between the feeders and return at some predetermined point on the transmission system. Low voltage is applied to the line at the point of supply and gradually increased, readings being taken of current in the line and the applied voltage, at various loads corresponding to those obtained under normal operating conditions.

The coal company selected affords a typical example of the conditions endured by the average operator.

By referring to Fig. 5 it will be seen that the positive circuit consists of two 0000 wires, one of which serves as a trolley from the drum-house to the point of short circuit, a distance of 2600 ft. At this point the tram and positive line divide, one running to mine "A" and the other to mine "B," the difference in elevation of the two seams being approximately 100 ft. The negative side, or "return," consists of 2600 ft. of 45-lb. rails, 1000 ft. of 30-lb. rails on an incline and 200 ft. of double 0000 copper wire extending from the end of the incline to the power house.

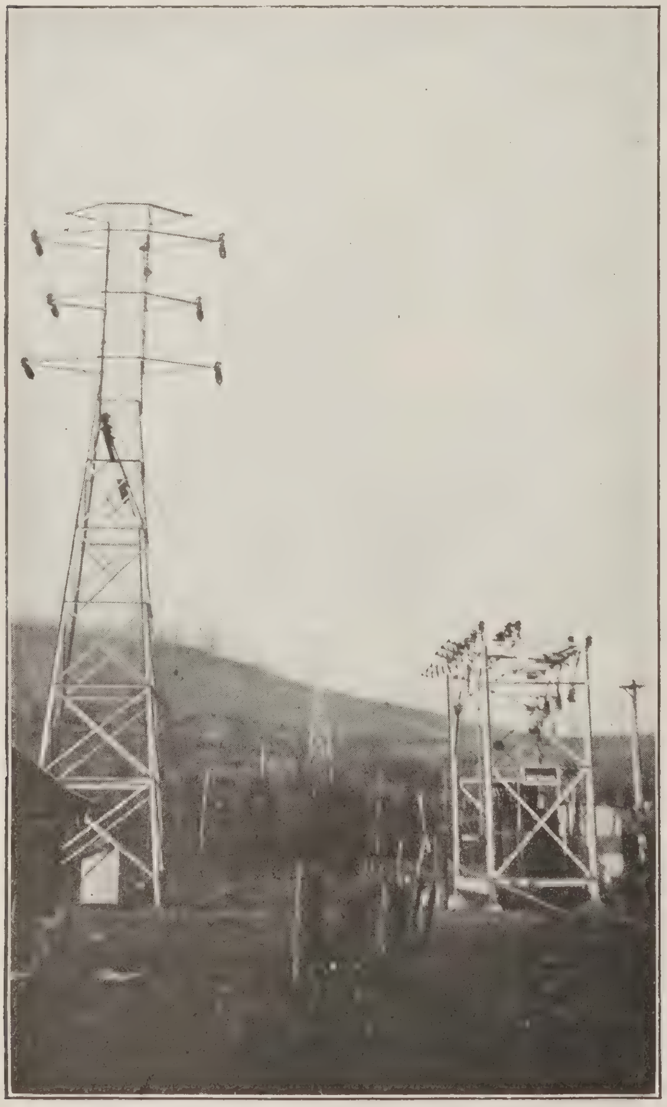

Fig. 3. Take-off Tower and High-Voltage Substation

The generating equipment consisted of one 150-kw., 260-285-volt, 550-r.p.m. direct-current generator belted to a simple 225-hp. engine. The odd voltage is due to a set of specially wound shunt field coils, replacing a former set burnt out by maintaining a higher voltage than that for which the machine was originally designed.

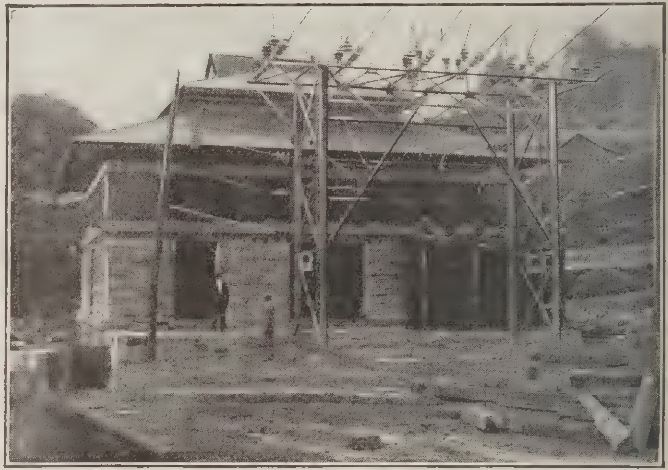

Fig. 4. Customer's Substation with Power Company's High-Voltage Outdoor Substation Adjoining

In order to secure the most accurate results, all readings were taken on portable instruments located in the power house and known to be correct. By means of the field rheostat and by gradually increasing the speed of the engine, the load was slowly built up, readings being taken simultaneously upon both ammeter and voltmeter at one-quarter, one-half, three-quarters, full and one and one-quarter loads. The voltmeter reading represents the actual loss in voltage in the line when operating under normal conditions and at a corresponding load. In order to eliminate any errors due to incorrect reading of meters, all readings were carefully checked. A complete analysis of results so obtained is as follows:

RESULTS OF TEST

Load	Amp.	Voltage Drop	Percentage Voltage Drop	Kw. Loss in Trans.	Available Voltage at Proposed Substa.
¼	137	30.5	11.2	4.2	238.5
½	274	51.5	18.8	14.1	220.5
¾	411	72.0	26.6	29.5	211.0
1	546	94.0	34.0	51.3	191.0
1¼	683	112.0	40.7	76.4	167.0
1½*	820	133.0	48.5	109.0	127.0

*Calculated.

The above results are shown graphically in Fig. 1. As figures speak for themselves, it does not seem necessary to devote any space to a discussion covering the results, other than calling attention to the high losses that occur between half-load and one and one-quarter load, the limits between which a mine load is constantly fluctuating.

By again referring to the sketch, it will be seen that mine "A," with a maximum motor haulage of 3000 ft., is located at an additional distance of 875 ft., while mine "B," with a corresponding haulage of 900 ft., is located 1050 ft. from the site of the proposed substation.

This location was agreed upon as the most advantageous site for a substation by both the superintendent and myself, after carefully considering grades, future development and local conditions. One of the principal factors covered by the so-called local conditions is the attendant, who in this case, as well as in numerous others, would be the blacksmith. The necessary attention consists of starting and stopping, pouring a little oil in the bearing about once a month and occasionally putting in the circuit breaker. By means of a simple attachment on the switchboard an electric gong is sounded upon the opening of the breaker and continues until it is closed.

Upon the completion of the test and in order to study the voltage conditions back in the mine, an offer was made to measure the voltage at different points throughout the two mines under different load conditions. To this the superintendent replied, "I know that my power is 'rotten,' but as to just how bad it is, that is something I'm better off not knowing."

One Reason for Excessive Costs

How true the above is! If conditions existed generally, as found in some mines working under similar conditions where the voltage ranges from 180 to 200 volts, on a 250-275-volt system, the decreased output and excessive costs at certain plants would be easily explained.

In order to give one an idea of the substantial line construction and high class of workmanship found throughout the 140 mi. of transmission lines, Figs. 2, 3 and 4 are given.

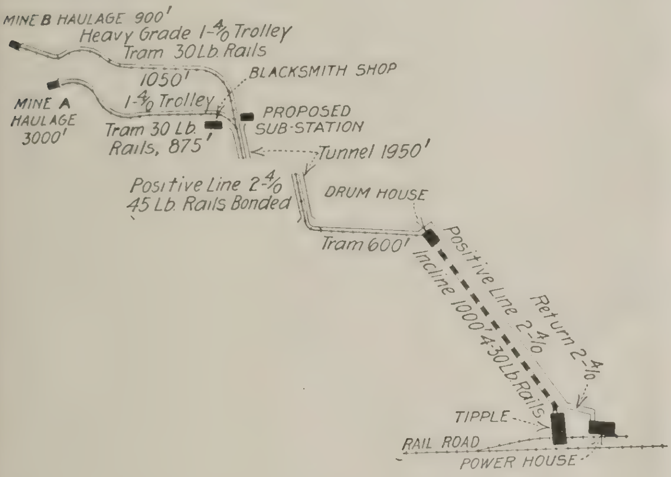

FIG. 5. SKETCH SHOWING LOCATION OF MINES IN RELATION TO POWER HOUSE

Fig. 2 shows the standard type of high-voltage, out-of-door substation used exclusively by the power company before referred to. The galvanized iron meter house can be seen in the rear. This particular substation serves two customers, power being stepped down from 44,000 to 2200 volts.

Fig. 3 shows a take-off tower, with one of the regular type in the distance, also the two overhead ground-wires. Special attention is called to the double-power circuits, the lines being so sectionalized as to permit the cutting out of sections for repairs. Immediately in the rear of the first tower will be seen one of the numerous telephone booths distributed at frequent intervals along the lines. Each patrolman is required to make his report upon arriving at a telephone. In this way the dispatcher not only receives a complete report of the entire system every four days, but keeps in constant communication with each man out on the lines.

If it were not for the electrical apparatus both inside and out, Fig. 4 could well be taken for a public building, because of its attractive appearance and tile floor, rather than a substation supplying power to a coal mine.

The power company's entire electrical equipment, including the two 10,000-kv.-a. turbo-generator sets, was furnished by the Westinghouse Electric & Mfg. Co. This is also true in regard to the greater portion of the customer's apparatus. With very few exceptions the motor-generator set was chosen by the customer in preference to the rotary converter to change his alternating current into direct, owing to its special adaptability to this particular class of service.

⁂

The Labor Situation

SYNOPSIS—In eastern Ohio a spirit to compromise on "dead work" in return for a concession on the mining rate seems about to close the long dispute between capital and labor. In Colorado John R. Lawson is convicted of the murder of a deputy sheriff.

The conference of operators and miners' representatives at Cleveland, Ohio, appeared to make some progress in the settlement of the eastern Ohio strike. Both sides appeared willing to make concessions, and the chances for settlement are the best in months.

Saturday, May 1, was occupied in discussing the width of rooms and the cost of work in slopes. Other points were the price of "dead work," rules governing the right of operators to employ and discharge workmen, the "handling" of dirty coal and the right of aggrieved employees to appeal to the grievance committee. The operators seek to include in the wage agreement a clause binding the miners to use care so as to load only clean coal.

Miners Ready to Concede Everything but the Mining Rate

In fact throughout the week no vital disagreements appeared. It seems well understood that the operators are prepared to sign an agreement giving the miners 47c. per ton for machine-mined run-of-mine coal provided the latter will make such concessions in "dead work," day labor and conservation of coal as will equalize the cost of producing coal in the eastern Ohio section with the cost in the region mining under the Pittsburgh scale. There the rate is only 44.61c. per ton for the machine-mined run-of-mine coal.

In the meantime the Gallagher amendment to the Green anti-screen law is not legally dead. Though it was defeated in the House, after being passed in the Senate, a motion was made to reconsider it, and the vote on that motion has been postponed from time to time. This keeps the amendment alive to a certain extent. Eastern Ohio operators are making a strong effort to secure the passage of the amendment, but there is not much hope that it will receive reconsideration from the House.

John R. Lawson Convicted

John R. Lawson, member of the International Executive Board of the United Mine Workers of America, was found guilty of murder in the first degree in connection with the shooting at Ludlow, Colo., of John Nimmo, a deputy sheriff. The murder occurred on Oct. 25, 1913. Lawson was sentenced to life-imprisonment at hard labor in the Colorado penitentiary. The jury had the power to order a sentence of death or life-imprisonment and apparently debated long on this choice, for the verdict was not given till May 3, whereas the jury retired to consider a verdict on May 1.

The attorneys for the defense are given 30 days to file a motion for a new trial, and Lawson is released temporarily in charge of his counsel. The murder occurred before the state constabulary had charge of the situation and while the Ludlow section house was under the command of K. E. Linderfelt. Early in the afternoon of Oct. 25, 1913, a fight occurred between the strikers and the deputies, and firing continued till the evening. During the battle Nimmo was shot through the leg and bled to death.

It is not alleged that Lawson fired the shot. He is said to have been in charge of the camp at the time and to have directed the battle. It is for those who have read the evidence to attempt to discuss the verdict, but it is clear that feeling is raised to a high degree.

The United Mine Workers' attorney, Horace N. Hawkins, declares that "Rockefeller's lawyers worked up the evidence against Lawson, and Rockefeller's detective testified in the case to secure conviction," as if such aid to the prosecution was to be condemned. If somebody had tried to loot Hawkins' house and had killed those who tried to defend it, would not Hawkins endeavor to aid the prosecution and might he not employ detectives to discover who the offenders were? Could any court refuse to consider any such relevant and competent evidence as he might present?

Frank P. Walsh, chairman of the Federal Commission on Industrial Relations, has made a further attack on the Rockefellers. He declares that John D. Rockefeller, Jr., is merely the mouthpiece of his father, who is really responsible for the situation in Colorado. The other charges he has made he has not seen fit to substantiate.

⁂

Signal Wires in Mines

By A. A. Le Roy*

In many of the electrically equipped mines using 250- and 500-volt direct-current for operating various machines, it is customary and practically necessary to use this voltage on signal lines, hoist roads, etc.; and where this high voltage is so carried dangerous electrical shocks may be received.

The accompanying sketch shows a method of reducing the voltage on such signal lines and of eliminating danger from shock. It consists of two parallel series of five 125-volt, 16-cp. lamps, with the signal line connecting between the first and second lamp on the negative side of the circuit. It is important that the connection be made between the lamps on the negative side, so that where grounded systems are used the negative and ground will be of the same potential.

+
+
Bell or Relay Switch
Signal Wires
+

Method of Reducing Voltage on Signal Lines

A Bell or Relay Is Placed in Series

In series with the line connecting between the lamps should be a bell or relay switch, which when the rapper is put across or the signal wires short-circuited causes the current to flow through the bell or relay switch to the negative side, and the lamps between the signal-line connection and negative will darken. At the same time the lamps between the signal-line connection and positive side will brighten, thus sending the current through the bell or relay switch, causing the bell to ring or, if a relay switch is used, causing it to make connection with separate signal circuit. This system reduces the voltage to 80 volts on the bell line.

In case 250-volt direct-current is used, two parallel series of three 125-volt, 16-cp. lamps should be used.

As will be noted from the sketch, the signal wires are shunted around the two lamps next to the negative side of the series. As the human body has more resistance than these two lamps, the current will flow through the lamps; and a very small amount, if any, will flow through the human body in case it comes in contact with the signal lines, thus eliminating the danger from electrical shocks.

This system is now in use in the coal mines of the Utah Fuel Co. in Utah and Colorado and has proved satisfactory.

COMING MEETINGS

International Railway Fuel Association will hold its annual meeting at Chicago, May 17-20. Secretary, C. G. Hall, 922 McCormick Bldg., Chicago, Ill.

Rocky Mountain Coal Mining Institute will hold its next meeting in Trinidad, Colo., June 8, 9 and 10. Secretary, F. W. Whiteside, Denver, Colo.

West Virginia Mining Institute will hold its summer meeting at Wheeling, W. Va., June 15 and 16. Secretary, E. N. Zern, Morgantown, W. Va.

The American Society of Mechanical Engineers will hold its summer meeting at Buffalo, N. Y., June 22-25, 1915. Secretary, Calvin W. Rice, 29 W. 39th St., New York City.

The Kentucky Mining Institute will hold its summer meeting at Pineville, Ky., May 14 and 15, 1915. Secretary-treasurer, Ivan P. Tashof, Lexington, Ky.

The American Institute of Electrical Engineers will hold its annual convention June 29 to July 2, 1915, inclusive at Deer Park, Md. Headquarters will be at the Deer Park Hotel. Secretary, F. L. Hutchinson, New York.

The Illinois Mining Institute will hold its next meeting at Danville, Ill., May 27-29, 1915. The officers of the Institute are: President, J. W. Starks, Georgetown, Ill.; first vice-president, William Burton, Herrin, Ill.; second vice-president, Fred C. Pfahler, Belleville, Ill.; secretary and treasurer, Martin Bolt, Springfield, Ill.

The Coal Operators of West Virginia under the auspices of the Norfolk & Western operators, in conjunction with the U. S. Bureau of Mines and the Huntington Chamber of Commerce, will hold a state-wide first-aid and mine-rescue field meet and contest in Huntington, W. Va., May 14, 1915.

⁂

April Output of Anthracite

After three months of comparatively low production owing to the warm weather of the latter part of the winter, the output of anthracite was so large last month that the record for April shipments will probably be beaten. In April of last year shipments of anthracite were 6,072,164 tons, and the record for the month was made in April, 1910, when 6,224,396 tons were shipped.

The big increase in production is partly owing to the April discounts of 50c. a ton on the domestic sizes of anthracite and partly to the opening of the Lake trade. The unusually warm weather up to the first of April also enabled the retail dealers to allow their stock to run low so that they could take advantage of the discounts, which make a difference of over 9 per cent.

*General master mechanic, Utah Fuel Co., Salt Lake City, Utah.

New Apparatus and Equipment

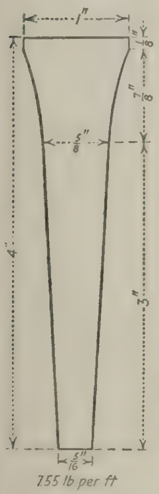
Believing that one of the greatest services that a journal such as Coal Age *can render its readers is to acquaint them with new and improved equipment which may be employed directly or indirectly to the benefit of the coal-producing industry, this department is inaugurated. For the present it will appear in the second and fourth issues of each month. We shall therefore be glad to receive from builders, manufacturers or dealers brief descriptions of new or improved pieces of apparatus in which they are interested, the use of which will tend toward better results in or the economic development of the fuel industry or any of its numerous ramifications.*

⁂

A New Heavy Screen Bar

For many years the largest screen bar in general use has been the diamond top bar, which is 2¼ in. deep; and while there were a few inquiries for larger bars, the demand was not great enough to justify the production of a larger section and manufacturers and operators at considerable expense built up bars to suit their requirements. Keen competition in the coal industry has, however, necessitated more careful preparation of coal, especially in the larger sizes, and this has resulted in a demand for a larger screen bar.

The Phillips Mine & Mill Supply Co. is now in position to furnish from stock, in maximum lengths of 18 ft. 6 in., a screen bar 4 in. deep, 1 in. wide across the top and $\frac{5}{16}$ in. thick at the bottom and weighing 7.55 lb. per ft. The accompanying drawing shows a cross-section of the bar.



Phillips Screen Bar

This is an ideal bar for screens with wide spaces, as its depth of 4 in. allows enough of the screen bars to extend above the top of the bearers or supporting beams so that the corners of large lumps will not catch at the bearers and clog the screen. In fact, this bar has been so calculated that a spacing of 6 in. can be safely accommodated without having to make provision for additional clearance in the bearers.

Another good feature is that if the notches in the bearing bars are spaced 1 in. between centers, the width of 1 in. across the top of the screen bar makes it possible to vary the spacing of the screen by inches. The new bar is interchangeable with the diamond top bar and can be used in the same notches, since the shank of the new bar has the same taper and is the same thickness at the bottom as the diamond bar.

The heavy shank, as well as the shape of the head, insures the stiffness and rigidity of the bar, while the curvature from the head to the shank will enable the screenings to get away quickly and not wedge between **bars.**

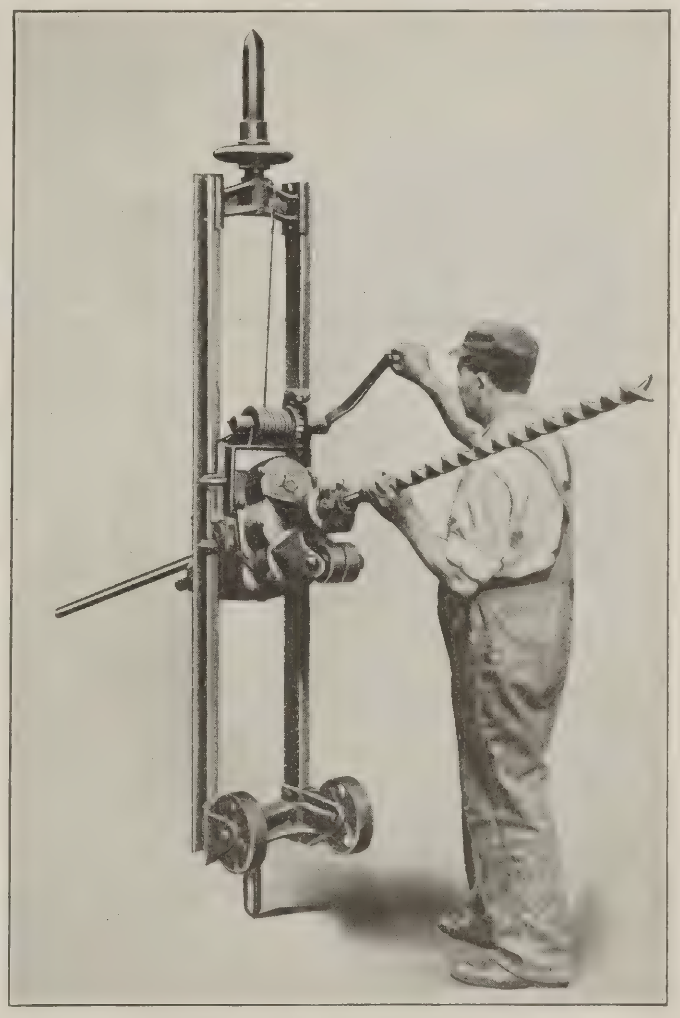
It is believed that when this bar becomes known it will be very popular, since the need for a bar of this sort has long existed.

⁂

A New One-Man Drill

The accompanying illustration shows a new type of powerful coal drill recently developed and placed on the market by the Jeffrey Mfg. Co.

The motor and drill mechanism proper are mounted on trunnions in a carriage, which may be raised or lowered in a vertical channel-iron frame by means of a ⅜-in. steel rope. One end of this rope is fastened to the top yoke of the frame and the other end to a drum on the carriage. This drum is rotated by a handle, as shown, to wind up the rope and to raise the carriage. A ratchet and pawl are provided on the drum to prevent the carriage from dropping when the handle is released.



New Type Jeffrey Drill

When it is desired to move the drill from one place to another, the carriage carrying the motor and mechanism is lowered to the bottom of the frame and the drill rolled along on the wheels provided on the bottom cross-yoke, in a manner similar to an ordinary hand freight truck.

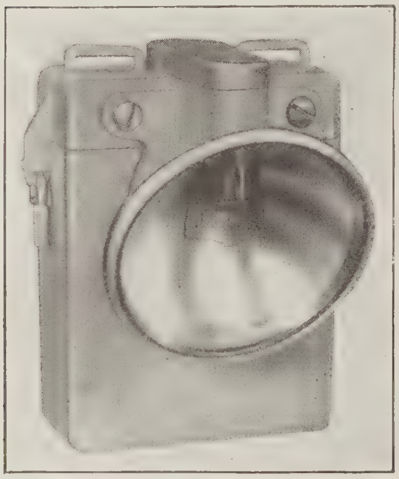
The motor of this drill is rated at 3 hp. The total weight of the drill is approximately 300 lb., while it is made sufficiently rugged and powerful to drill through any material against which the auger will stand up.

With the means employed on this drill for raising and lowering and with the wheels provided for moving it from place to place, only one man is required to move, set up, adjust and operate the machine.

The Wico Mule Lamp

It is fast being recognized that an electric lantern for mules is of equal if not greater importance than for men. The money lost through death of a mule resulting from the sudden extinguishing of a torch will pay for the cost of operation of a considerable electric equipment, and since such accidents are altogether too frequent in some mines, the electric mule lamp has received an appreciative welcome.

Electric mule lamps present a special problem in themselves. The first requisite is dependable strength. For that reason, the lamp housing of the Wico mule lamp has been made even stronger than the case which protects the battery and supports the housing. It is machined from cast aluminum with a cowl projecting far enough beyond the front glass to protect it from injury. All connections from the battery to the lamp are inclosed in aluminum so that the entire oufit presents a strong, light equipment free from fragile projections or complicated mechanism of any kind.



Wico Lamp for Mules

The lamp housing is attached to the cover part of the battery case, and when the battery is to be taken out for charging the cover is unlocked and unhinged from the case, disconnecting the electric circuit through strong spiral spring contacts.

It is said that mules that have worn electric lanterns refuse to budge when they are required to work without them. However that may be, no complaint has been heard of the new burden.

Influencing Employees against Unionism

By A. L. H. Street*

The law enacted by the Kansas Legislature in 1903, making it a misdemeanor to require an employee, as a condition to employment or retention in employment, to agree to refrain from joining, or to withdraw from, a labor union, is declared by the United States Supreme Court to be unconstitutional, in the case of Coppage vs. Kansas, 35 Supreme Court Reporter 240. As stated by Justice Day in his dissenting opinion, the importance of the decision is emphasized by the fact that statutes like the Kansas law have been passed in California, Colorado, Connecticut, Indiana, Massachusetts, Minnesota, New Hampshire, New Jersey, New York, Oklahoma, Oregon, Pennsylvania, Porto Rico and Wisconsin.

Holding that the right of an employer to refuse to employ union men is a correlative of the right of labor unions to exclude from their membership men who work with nonunion employees, the Supreme Court says:

"When a man is called upon to agree not to become or remain a member of the union while working for a particular employer, he is in effect only asked to deal openly and frankly with his employer, so as not to retain the employment upon terms to which the latter is not willing to agree. And the liberty of making contracts does not include a liberty to procure employment from an unwilling employer, or without a fair understanding. Nor may the employer be foreclosed by legislation from exercising the same freedom of choice that is the right of the employee.

"To ask a man to agree, in advance, to refrain from affiliation with the union while retaining a certain position of employment is not to ask him to give up any part of his constitutional freedom. He is free to decline the employment on those terms, just as the employer may decline to offer employment on any other; for 'it takes two to make a bargain.'"

Recent Legal Decisions

Operation of New Jersey Compensation Act—The New Jersey Compensation Act does not authorize an award for death of an employee of a coal-mining company who was killed while walking along a railroad track as a trespasser, another passageway having been provided by the mining company for the employee's use. (New Jersey Supreme Court, Siemientkowski vs. Berwind-White Coal Mining Co., 98 Atlantic Reporter 909.)

Accident Resulting from Fall from Mine Roof—When suit is brought to recover for injury to, or death of, a miner caused by a portion of a mine roof falling at his place of work, it is no defense that he negligently failed to examine the roof, in the absence of any showing that an examination made with ordinary diligence would have disclosed the danger resulting in the accident. (Alabama Supreme Court, Henderson vs. Tennessee Coal, Iron & R.R. Co., 67 Southern Reporter 414.)

Duty to Warn Employee—Excessiveness of Damages—An employee at work at a coal dock, oiling hoisting appliances, is entitled to recover for injury sustained by him through starting of the machinery without notice to him, his peril being known to the employees in charge of the machinery. Eleven thousand dollars is not excessive recovery for personal injury to a man who has been able previously to earn from $60 to $90 who is permanently incapacitated for heavy work, and who sustained a compound fracture of a leg, resulting in infection and sloughing away of muscles. (Minnesota Supreme Court; Arveson vs. Boston Coal, Dock & Wharf Co.; 150 Northwestern Reporter, 727.)

Pollution of Streams in Mining Operations—A downstream dairyman through whose farm a stream runs is entitled to recover against a coal company for pollution of the stream, rendering the water unfit for domestic and agricultural purposes, caused by discharge of water from the company's coal-washing plant. (Washington Supreme Court, Packwood vs. Mendota Coal & Coke Co., 146 Pacific Reporter 163.) The court cites a decision of the West Virginia Court of Appeals wherein a coal and coke company was held liable in damages for polluting a stream by casting refuse from the company's mine and coke ovens into the river, thereby impairing the waters for the use of a farmer owning lands down stream.

Reciprocating Engine or Turbine?

Among coal-mine operators the reliability of any piece of equipment is a consideration second in importance only to its safety. The daily tonnage produced has a direct and powerful influence on the cost sheet. Any interruption to service sends the costs per ton skyrocketing. Consequently the savings effected by the efficiency of any prime mover for a month may be totally eclipsed by the losses incurred through an hour's shutdown if such a shutdown demoralizes the organization and results in the loss of a day's output.

The reciprocating engine with simple valve gear, either the old "D" slide valve or the piston type, has met with much favor on account of its general reliability. The same has been true to a scarcely less degree of the corliss engine. This latter has heavy, slow-moving parts and takes up a considerable floor space. Its economy is good, and it possesses the ability to carry its load every day and all day without excessive attention or repair bills. This has in no small degree accounted for its popularity as a prime mover in coal-mine power plants.

All reciprocating engines are, however, open to many objections. The piston must be lubricated. For this purpose oil is introduced into the cylinder with the steam. This oil may be used once and only once, while if the exhaust is to be condensed or used in a feed-water heater the oil must be filtered out from the condensate before it goes to the boilers.

In any reciprocating engine there is a reversal of stresses upon the various parts, and an uneven torque is exerted upon the shaft. This reversal of stresses affects the piston, piston-rod crosshead, wrist-pin, connecting-rod and the bearings at each end, the crank-pin, crank and even the main shaft bearings and bearing pedestals. Thus at each revolution the piston-rod is placed first in compression, then in tension; the wrist-pin is subjected to a shearing stress, first on one side and then the other. These stresses are communicated from one link or element to another until the anchor bolts are at last reached and the earth absorbs the stresses through the foundation.

These difficulties are not due to malice aforethought on the part of the designer. On the other hand, much gray matter and many a sleepless night, to say nothing of large amounts of time and money, have been expended to avoid them or minimize their ill effects. They are, however, inherent in the idea of securing power by means of reciprocation or oscillation under the action of a fluid under pressure, and while their ill effects may be palliated, reduced, minimized they can never be wholly avoided. The fact that some reciprocating engines are at least reasonably reliable stands as a monument not to the excellence of the fundamental idea which they embody, but to the care, ingenuity and good judgment of the builder in his selection and distribution of the materials commercially available.

In marked contrast to the complicated mechanism of the ordinary steam engine is the simplicity of the steam turbine. Here there are no oscillating parts, no reversal of stresses, no internal lubrication, no uneven torque. The force of the steam is applied within a container, continuously and tangentially to the circumference of the revolving element. The torque is thus uniform; and no flywheel—which of course calls for a larger shaft and heavier bearings than would otherwise be necessary—is required.

It is unnecessary to introduce oil into the steam fed to a turbine, since the rotor does not touch the stationary element. The only lubrication necessary is that for the main bearings, and this presents only a simple problem in comparison with that of reciprocating parts. In a turbine the oil may be used, cooled, filtered and used again almost *ad infinitum.*

With customary conservativeness the coal-producing industry as a whole has shied at installing turbines in places where reciprocating engines had long been employed with reasonable dependability. Even today, after several plants have demonstrated clearly a reliability in excess of that secured with reciprocating engines, there are to be found many men who still doggedly pin their faith to the older and more complicated, although possibly the more generally understood, machine.

Coal Handling and Transportation Problems

The cost of coal on the railroad car depends largely on the expenditure of labor in handling and transporting it in and around the mine. In this country it is in the anthracite region that this cost is the highest. Undoubtedly this is partly due to the irregularity of the coal beds, to the more finical cleaning and sizing and to the closer supervision which the dangers of anthracite-mine work entail.

The purpose of this editorial is to compare the operating efficiencies in the various mining sections. In this connection it must be remembered that anthracite is always sold in its natural condition, and the number of men engaged on the outside is not increased as that of the bituminous-coal regions often is by expenditures for labor in coking or even in the saving of byproducts. These are in truth manufacturing, not mining, processes, and the men employed in them should not be considered in enumerating the men engaged in producing the coal or in considering the relative efficiency of mining methods in various parts of the country.

It must be carefully kept in mind that the outside employees in the anthracite region would make a better showing, both relative and actual, if we were to eliminate in the estimation of that and other fields the number of men engaged solely in the cleaning and sizing of coal. The anthracite region of Pennsylvania supplies statistical information in which "slate pickers" are segregated, and we are informed that under this caption are included all employees inside the breaker, such as jig-tenders, platemen, etc. The reports from the bituminous regions of Pennsylvania, West Virginia and Illinois do not give any enumeration of workmen engaged in cleaning and sizing, though there are many men so employed, some being actually on picking tables and others trimmers on cars.

Lest too much weight should be placed on the cost of breaker work, a quotient has been obtained by dividing the whole tonnage, 91,626,964 tons, by the number of men and boys employed on the outside, excluding those working within breakers and listed as slate pickers. The divisor is thus reduced from 46,643 employees to 37,522. The quotient to which we have referred is 2442 tons per year, or 10.09 tons per day, a figure so low that it seems hard to explain. And yet in comparing this figure with the larger figures of the bituminous region, it must be borne in mind that the latter have not been "doctored" by the omission of cleaners and sizers in making the estimation.

TONNAGE PER EMPLOYEE IN PENNSYLVANIA, WEST VIRGINIA AND ILLINOIS

	Employees	Per Cent.	Tons per Employee per Year	Tons per Employee per Working Day
Penn. anthracite, 1913*:				
Miners	78,319	44.67	1136†	4.69
Other inside employees	50,348	28.72	1768†	7.31
Outside employees‡	46,643	26.61	1964§	8.12
Total	175,310	100.00	523	2.16

* All mines reporting. † Based on all tonnage except that from culm-banks. The whole tonnage was 91,626,964 in 1913, 2,619,785 being from mines and strippings, leaving 89,007,179 tons obtained from culm-banks. ‡ This includes 9121 slate pickers, men and boys, or 5.20 per cent., cleaning 10,046 tons per employee per year, or 41.51 tons per working day. § Based on the full tonnage; namely, 91,626,964 tons.

	Employees	Per Cent.	Tons per Employee per Year	Tons per Employee per Working Day
Penn. bituminous, 1913*:				
Miners	122,932	64.73	1407	5.61
Other inside employees	33,342	17.56	5188	20.67
Outside employees†	33,635	17.71	5142	20.49
Total	189,909	100.00	911‡	3.63

* All mines reporting. † This includes 10,122 coke employees, or 5.33 per cent., coking 37,381,029 tons, or 3693 tons per employee. Without these men, who are really engaged in manufacturing, there would be only 23,513 outside employees, or 12.38 per cent., the production being 7356 tons for each such employee per year, or 29.31 tons per working day. ‡ Excluding coke-workers, this figure would be 962.

	Employees	Per Cent.	Tons per Employee per Year	Tons per Employee per Working Day
West Virginia report of 1912*:				
Miners	43,581	62.60	1531	6.84
Other inside employees	13,277	19.07	5026	22.44
Outside employees†	12,758	18.33	5231	23.35
Total	69,616	100.00	959	4.28

*All mines reporting. † This includes 2297 coke employees, or 3.30 per cent., coking 3,310,250 tons, or 1441 tons per employee. Without these men there would be only 10,461 outside employees, or 15.03 per cent., the production being 6379 tons per year, or 28.48 tons per working day for each such employee.

	Employees	Per Cent.	Tons per Employee per Year	Tons per Employee per Working Day
Illinois report of 1913*:				
Miners	53,588	69.73	1129	6.31
Other inside employees	16,718	21.75	3619	20.22
Outside employees	6,549	8.52	9240	51.62
Total	76,855	100.00	787	4.40

*Shipping mines only.

But there is another vitiating principle in making comparisons to which attention must be drawn. In the anthracite region there are many strippings, and the men engaged in this work would find their appropriate classification in our tables, not as outside men, but as miners. Unfortunately, the tonnage of strippings and the men employed at such open-cut work have not been segregated in the mine reports, except in Illinois, and there the stripping work is of almost negligible importance. In the year ending June 30, 1913, about 152 men at seven strippings in Illinois mined 137,448 tons.

Another difference between anthracite and bituminous conditions makes a comparison of the work of inside men somewhat unfair. In the anthracite region there is much labor expended in reworking old breasts, especially in the Lansford district. In some cases possibly there are advantages in this work, making it more profitable than first mining, but in nearly every case second mining of this description is far more expensive than work in undisturbed coal.

Perhaps there are no sections in the Union with more efficient outside handling systems than those found in western Pennsylvania and Illinois. In the former the economy largely arises from the largeness of the operations. In the latter it finds its source possibly in the fact that the mines are mostly shafts and that the preparation of the coal is limited to careful sizing. The fact that much tramming which is outside, or tipple, work in the case of a drift is inside, or caging, work in case of a shaft, also accounts for the lower productivity of Illinois inside hands. The gain secured on the surface is a loss below.

On the other hand in western and central Pennsylvania the coal instead of being tipped by self-dumping cages is dumped on a tipple, which takes more surface hands though less men are needed below. The long haulages common to drift mines in that section are also a cause of wastage of labor, though they probably more than pay for themselves by the saving in shaft sinking and other first cost. In many cases there are long gravity planes which need the services of many men. Moreover, picking tables are somewhat numerous in central Pennsylvania.

The necessity that shotfiring in Illinois should be performed by men specially employed for that purpose increases the number of men engaged in underground work. In many cases these men are supplemented by fire hunters whose business it is to see that the shots have not ignited the coal and to extinguish an incipient blaze if such be found.

It will be noted that, excluding coke workers, the production per outside employee in the bituminous regions of Pennsylvania is 29.31 tons per day; in Illinois, where the coke ovens are away from the mines and are therefore not considered in the state report of the mining industry, the production is 51.62 tons per day for each outside workman.

The showing for this latter state (Illinois) is truly remarkable and we are informed by one of the largest operating concerns that it is not obtained by excluding men in official position from the enumeration, but represents a real economy in mine labor. Irregular operation may, and frequently does, help to increase the tonnage of coal mined per miner in any working day, but it does not give any aid to the management in increasing efficiency in other labor; for when places are vacated by the removal of workmen who become discontented at the frequent idlenesses, the transportation problems are made difficult and the outside men are often prevented from being supplied with the tonnage for which the operation was designed.

Some sections suffer from old-time regulations. In the Blossburg section of Pennsylvania, for instance, it was and perhaps still is customary to have boys at all switches, though in other regions the mule-drivers throw their own switch levers without any measurable waste of time. In many small mines overcasts are still unknown and door-boys are employed by the dozen. In fact, sometimes a strike of the door tenders and switchboys to secure what they consider due recognition in the union or for some other reason has shut down the mines.

We have calculated the preceding figures with the idea of showing the relative efficiency of the several sections of the country. Under miners we have included in the anthracite region both miners and laborers. In the bituminous regions we have classed under that head miners, machine runners, loaders and scrapers.

It will be noticed that these figures conflict with some we published in our editorial on "Efficiency" on Mar. 27. In fact, the Pennsylvania bituminous production for 1913 was placed at 1009 per employee. Here we have it only 911, and excluding coke workers it is 962. But the reason for this discrepancy is that the figures given are from the state reports, and they are not exactly on the same basis as those from the federal sources. The definition of employee in the state reports varies much, and in West Virginia the estimate entirely excludes superintendents, mine foremen, firebosses and clerks. The federal estimate is based on all coal produced whether the mines ship coal by railroad or boat or in farm wagons. The state reports are usually entirely incomplete as to occupations in "nonshipping" mines and in some cases overlook them altogether.

It is extremely hard to tell how many men a mine has averaged in its employment during any month or year, and several men with all the facts in detail before them might make widely different reports. Thus one man might take the number of men employed in December; another might average the men on the roll during the various fortnights. A third might look further and realize that he had more men on his payroll than were working on any particular day. Some men came to the mine during the fortnight, yet did not mine coal every day during that period; others left before the fortnight was over; and the number of men on the roll might well be 5 per cent. higher than that of the men actually in the employ of the company at any one time.

Moreover, some will not work on working-days. Sometimes 50 per cent. will be idle, so that the diligent inquirer will try to ascertain how many actual workers were at the mine on each day and then he will begin to approach another problem. Many men, he will find, only sent out one car, and he will at once suspect that the man was absent and that the car filled was loaded the day before and so should be credited to that day. Or perhaps it was loaded by the man's "buddy," and it would therefore be clearly a mistake to include this man on the working force of the day.

Thus the figures of the report will depend partly on the degree of anxiety of the clerk to make a complete report and partly on his understanding or misapprehension of the information wanted. If he is seeking to know how much is produced by working men on working-days he throws out men who do not work. If he desires to make a census of the force under employment on the average working-day he includes these men until the last day or last but one on which they are credited with tonnage.

But admitting these uncertainties, we note that the inside men, other than miners, and the outside employees of the anthracite region produce barely one-third as much per man as the bituminous mines, though the miners are able to produce almost an equal amount of coal. It will be seen that the coke workers of West Virginia produce barely half as much per man as like employees in Pennsylvania. This may be owing partly to discontinuous work. But it is also due, doubtless, to the lack of Belgian or byproduct ovens and to the absence of coke drawing, quenching and loading machinery.

⁂

Lesson from the Layland Explosion

According to the coroner's verdict the deaths in the Layland mine on Mar. 17 resulted from a "blown-through" shot. John Marcunnic, a foreign miner, doubtless without the least idea of the damage he was liable to cause, drilled a hole a foot too deep into a narrow pillar of coal between two entries. As a result the powder blew a hole through the pillar instead of breaking down the coal, and it acted in a manner precisely similar to the explosions so repeatedly and clearly illustrated by the United States Bureau of Mines at the experimental mine, Bruceton, Penn.

A blown-through shot is like one which blows out; it has an equal power to raise and ignite coal dust. It is almost impossible to prevent an overestimate of the thickness of a pillar and to avoid therefore the drilling of a hole which may be so long as to constitute an element of danger. The only assurance is to keep the mine so damp or so well dusted with powdered rock that an explosion is impossible and to regard a blowout or blown-through shot not as *the* cause but as only *one* of a train of causes in a mine explosion.

⁂

Money vs. Reputation

Some men make money at a sacrifice of reputation; others increase reputation at a money expense. Moral and ethical standards condemn the former and commend the latter. If, however, we can enlarge our earnings and add to our reputation at one and the same time, it must follow that such effort is wisely expended.

Applied to yourself, Mr. Coal-Mining Man, the foregoing discourse means—write an article for COAL AGE. One man last year added $800 to his income by contributing to this paper, practically all the work being done in spare minutes. Everyone is not as adept at grinding out worth-while articles as the particular individual referred to, but any man, educated or uneducated, who has good common sense, practical experience and fair observation can get together mining facts that are of interest and value to others in the industry.

Our forewords each week have undoubtedly attracted your attention; try your hand at writing something for this display page. It may be highly technical, intensely practical or embody some helpful philosophy of a more human order. If you can get a single worthy thought across, your effort will be a success. This will net you all the way from $5 for a rough idea to $20 for a finished foreword.

Then there are a hundred other subjects directly bearing on coal mining, at least one of which will appeal to your taste and come within your experience. Study several recent copies of COAL AGE, pick your subject and get busy. Your pocketbook won't suffer, and above all, your friends will know you are still above ground.

Sociological Department

Staging Mine Fatalities at Mining Camps

The H. C. Frick Coke Co. is introducing a new feature in its campaign of education to promote safety. A meeting was held on Apr. 1 in the basement of the Presbyterian church at Leisenring No. 2, Fayette County, Penn. The purpose was to demonstrate ocularly how accidents could be avoided. After a speech by Superintendent R. K. Warnock, who presided, a demonstration was given on a raised platform showing a "fall in the drawing of pillars" being made in an improper manner. The posts were pulled and the men caught under the fall of roof. This operation was then repeated in the proper manner, the men being uninjured.

Elmer Fox gave a lecture on the use and care of the safety lamp, showing how safety lamps become defective and the danger of using such a lamp with a cracked chimney. He ended with a demonstration in which he ignited gas by manipulating a lamp carelessly.

The mine foreman, William Cowie, then showed the men the danger of not obeying the orders of the boss in the setting of posts. This was done by ordering William Brodrick to set a post in a room neck. The man failed to do so, and the rock fell, breaking his back. Ernest Dodgson then exhibited first-aid work after an accident.

Songs in both English and Slavish were sung, and the Munroe Mandolin Club gave several selections. The last number was an address by I. G. Roby, one of the state inspectors of mines.

A Whole County Takes Up Gardening

C. L. Clayton, a demonstrator of Louisville, Ky., who several years ago organized the Louisville Garden Club, has been sent by J. W. Newman, the Kentucky Commissioner of Agriculture, to Bell County, southeastern Kentucky, to direct the coal miners in the planting of 1000 gardens. Dr. J. F. Foley, who is health officer for Bell County, has been instrumental in securing Mr. Clayton's services.

These gardens range in size up to an acre apiece and are supplied by the coal operators. Lectures are being given, and films, illustrating garden work, are shown at the several motion-picture houses. Pamphlets are circulated, and the Federal Department of Agriculture has promised to send a female instructor to the county to show the wives of the miners how the surplus vegetables grown in the summer may be preserved for winter use.

It appears that large quantities of potatoes are being shipped into Bell County for the miners' consumption. These could just as well be grown in the miners' own gardens. Bell County is an active mining center, having among its large interests the Continental Coal Corporation with headquarters at Pineville.

Idle Apparatus

The anthracite operators of Pennsylvania are devoutly thankful that much rescue apparatus maintained by them at great expense remains idle. A case in point is that of the Lehigh Valley Coal Co., which equipped several fire cars for underground use in the mines over two years ago. These cars carry an electric pump which can deliver 300 gal. of water a minute, two large 30-gal. chemical extinguishers, a number of smaller-size ones, axes, buckets and complete first-aid outfits. The cars can be taken anywhere in the mines where track is laid.

At about the same time the Lehigh Valley Coal Co. elaborately equipped a railroad car for rescue work on the surface. This is fitted with operating tables, surgical instruments, lockers, water-coolers, first-aid supplies, stretchers, rubber and woolen blankets, Draeger oxygen helmets and pulmotors. It has had to be moved only once from its home station at Hazleton.

Rescue outfits are kept at central points at all the collieries in the region, and much care is expended to keep everything in working order and ready for instant use. Like the fire-fighting apparatus on a transatlantic liner, it may not be needed for a dozen years, or possibly never, but it has to be ready at all times. The prompt action of the local first-aid and rescue squads has had much to do with the lack of necessity for using these precautions.

Improved Milk Supply

In Whitley County, southeastern Kentucky, the Stearns Coal & Lumber Co. has just purchased a thoroughbred registered Shorthorn bull of milking strain and will use him for service at the recently established mining camps. It is the purpose of the company to improve the grade of the stock owned by employees and farmers in the section.

The United States Coal & Oil Co., at Holden, Logan County, W. Va., has just completed at a cost of $6500 a model dairy barn for supplying its men with pure milk. At Colver, Ellsworth, Heilwood and Morea Colliery, all in Pennsylvania, similar institutions may be found.

* * *

A six-team baseball league is being organized to play a summer schedule in the West Virginia-Virginia field. All salaries are to be guaranteed, and a high standard of baseball will be maintained. D. B. Sayers, chief engineer of the Stonega Coal & Coke Co., Big Stone Gap, Va., is looking for several players.

* * *

The coal operators of the Pocahontas, Tug River and Thacker districts of West Virginia, comprising what is known as the Norfolk & Western Ry. field, the Huntington, W. Va., Chamber of Commerce and the United States Bureau of Mines will hold a first-aid and mine rescue meet at Huntington, May 14, commencing at 9:30 a.m. with rescue events selected from six specified problems. In the afternoon first-aid events will be chosen out of 21 selected problems. The American Mine Safety Association and the American Red Cross will also offer prizes. The West Virginia Medical Society will be present at the meet. This will make it the more easy to secure judges. Invitations to the meet have been sent out by H. D. Smith, of Elkhorn, W. Va.

Living Conditions at the Colorado Fuel & Iron Co.'s Mines

Primero Is a Coal-Mining Village of the Colorado Fuel & Iron Co., in the Trinidad District, Las Animas County, Colo.

Discussion By Readers

Efficiency in American Mining

I have been much interested in reading the editorial entitled "Efficiency," Coal Age, Mar. 27, p. 547. Having had a considerable knowledge and experience of mining conditions in Europe and America, I may be qualified to comment on some of the statements made in the article to which I refer.

In the first place, I must disagree with the statement that "The foreign mine expert, on his arrival in America, travels around the mines here and in Canada and goes away saying that there is nothing to see." In some respects it is true that he is "disappointed" when he views the surface equipment of many of our mines. Our surface plants are often laid out in such a manner that the foreigner gets an impression that the topworks have been erected without a plan. In many instances, the workshops are widely separated, requiring that pieces of machinery and other material be carried from one shop to another, entailing loss of time and labor. The supply yards for timber and other material are frequently so located that the daily supply of props, cap-pieces, rails and other material required in the mine is made laborious and expensive.

When, however, the foreign visitor goes underground, his eyes open wide and he examines with increased interest the methods of transportation, wide track-gages and mine cars of large capacity. On his return he never ceases to talk about what he has seen underground in American mines and to advocate the adoption at home of many of these features. As a matter of fact, in regard to transportation both on the surface and underground, American mining is far in advance of that in other countries. Again, the output per man in American mines and American tonnage sheets never fail to attract the attention and excite the admiration of mining men from other countries who visit our mines.

However, the foreign visitor is likely to look further than this. He is much interested in the balance sheet, and here it must be acknowledged that American mining has nothing of which to be proud. Permit me to say, then, that when articles are published comparing the production of coal per man in different countries, such as that which appears on p. 548 of the issue of Coal Age to which I have referred, it would be of interest, especially to the foreigner, to give in the same connection the dividends these operations are paying on their common stock. The comparison would help coal operators in this country to realize, to use a common phrase, that they are still "holding the baby."

A careful study of this subject has convinced me that the returns on capital invested in bituminous coal mining are smaller in America than in any other part of the world. The lesson to be learned by these reflections is that if the European mine owner can have a magnificent mine building, palatial bathhouses and offices, garden villages and parked areas, and can still pay his workmen adequate compensation for injuries, extract all his coal, observe strict and burdensome laws in respect to the mining of the coal and yet show a low fatal-accident rate while paying 10 or 20 per cent. on his common stock—surely, that is "efficiency."

I am convinced that it is the firm desire of Coal Age to improve coal-mining conditions in this country, and if, as is true, numerous coal-mining companies here are tottering on the brink of bankruptcy owing to the ridiculously low selling prices of coal, the question that is of the first importance is, "How are conditions existing here to be improved?"

Improved Fireboss System

I was pleased to see that the recent discussion on "Mining Laws, Legislation and Mine Regulations" drew frequent attention to the work of the fireboss and his being obliged to cover too large a territory, making it impossible for him to complete the examination properly within the time required.

In the mine where I am employed there has been a recent change in this regard. Under the old system it was customary for the fireboss to enter the mine at 3 a.m., make his examination of the working-places and report on the outside at 6 a.m., in order not to delay the men entering the mine in the morning. The fireboss was then on hand to receive any instructions from the mine foreman and to give whatever instructions were necessary to the miners as they entered the mine for work. Having done this, he would proceed to make his second examination while the men were at work. When making his second examination he would give special attention to the safety of every working-place in the section of the mine in his charge. He would examine all falls and abandoned places and see that the ventilation, drainage, haulage roads and timbering were in good condition, so that there might be no delay in securing a regular output of coal from every place. Under this system each fireboss had from 50 to 100 men in his charge, while one or perhaps two shotfirers would be employed in each section to blast the coal and rock as required.

After much deliberation it was decided that in order to secure the greatest safety and economy of working it was necessary to change the entire system of inspection. A sufficient number of firebosses were therefore employed to divide each district of the mine and give each man the charge of only from 35 to 50 men, which was one-half the previous number, and make him perform the duties of both fireboss and shotfirer.

Under the new system the fireboss enters the mine at 4:30 a.m., examines his section of the mine, and reports outside at 6 a.m., as before. As under the old system, he still works nine hours a day, however. In his second examination he must perform the additional work of blasting the coal and rock as required, which was formerly done by the shotfirer. The new system gives general satisfaction, the only objection made being that, with the additional work of blasting, the fireboss has little time for examining the falls and abandoned places in the mine, in such a manner as he should.

The most important feature of this system is that each section of the mine is provided with a shanty, located at about the center of the section. It is made by building two tiled walls in a cut-through. Each shanty is about 20 ft. long, 12 ft. wide and 6 ft. high, whitewashed and electrically lighted. The place is fitted with shelves and equipped with a "first-aid" outfit, stretcher, blanket and fire extinguisher, besides a full kit of tools for general work—picks, shovels, axes, hatchets, saws, hammers, jacks, wrenches, etc. These tools are given out as required and returned to the shanty at the end of each shift. The place is kept securely locked by the fireboss, who is responsible for its contents.

At the end of each shift each fireboss fills out a printed report blank showing in detail the condition of the section of the mine in his charge. These reports are given to the mine foreman, who sends them to the office. In the working of the new system it is claimed that the additional labor of shotfiring urges the fireboss to make constant endeavor to keep the coal moving. There is thus secured a more regular output and a reduction in the cost of production. In addition to his general instructions each fireboss is provided with a code of rules drawn by the management and a blueprint copy showing the ideal position of the drillholes in a working-face.

Recognition of Bravery

Letter No. 12—I read with much interest the discussion in Coal Age in reference to the recognition of bravery and heroic deeds performed by miners in time of mine disasters. The question has been raised as to who should be rightful competitors for such recognition, and what should be the nature of the award—whether it should be purely honorary or an attempt be made to compensate, in a measure, one who makes so generous a sacrifice without a thought of his own danger.

In Letter No. 7, Coal Age, Mar. 27, p. 550, John H. Dye asked the pertinent question: "Should such recognition be extended to men who are performing the duties for which they are paid and which is the recognized part of their service to the government, or should it apply only to the man who has left his working-place and generously given his service without thought of pay or reward?" In my opinion, all miners and others connected with mining and all who engage in rescue work should be considered as rightful competitors.

While it is unquestionably the duty of mine inspectors and employees of the Federal Bureau of Mines engaged in rescue work to take a leading part when they are present, since they are better trained and equipped for the work, the same duty devolves upon all to render every assistance in their power to save life in time of peril. As far as the miner is concerned, it cannot be expected that his work would be as effective as that of men trained and equipped for such work, but his act would be none the less brave and heroic, and the purpose is to recognize such bravery and heroism whether it be rendered by trapper boy, miner or government employee.

In Letter No. 1, Feb. 27, p. 383, "Bykem" asks: "Should the reward be entirely honorary in all instances or conditioned to suit the rescuer's own physical condition when that is permanently impaired?" He cites the classification made by the City of Chicago in recognition of similar heroic work on the part of its employees. In that classification three grades are mentioned—commendation, honorable mention and honorable mention with medal. Geo. S. Stewart, in Letter No. 5, Mar. 20, p. 513, thinks compensation should be extended in proportion to the sacrifice made.

I cannot believe that a monetary recognition for acts of bravery would accomplish the desired end, which should be to foster in men a spirit of doing for another what one would want that other to do for him under similar conditions of danger. I believe that a monetary compensation would have a tendency to invite acts of foolhardiness on the part of would-be rescuers more than if the recognition was to be entirely honorary. In coal mining it is a recognized duty incumbent on all miners to aid, as far as possible, in rescue work when the need arises.

Those were good words of "Flat Top Engineer," in Letter No. 3, Mar. 13, p. 471, where he describes the miner in time of peril as having but "one subconscious unformulated thought that, perhaps, a human life may be saved or a human service rendered"; and I would add that every true miner feels the rendering of that service is incumbent on him. When a mine disaster has occurred and miners are entombed, ventilation destroyed, the mine liberating explosive gas and on fire, surrounded by frantic mothers and weeping children pleading for the rescue of husbands and fathers, the fellow-miner with a heart full of human sympathy and with heroic courage forgets his own danger and enters the mine with but one thought and purpose. Why speak of pecuniary reward for such a man, when his reward is in the satisfaction of having made every possible effort to save the lives of fellow-workers?

As long as coal is mined disasters must occur that will call for the voluntary service of miners that will involve danger and peril. There will be acts of bravery and heroism that will merit recognition. Let this recognition be made in a way that will stimulate self-sacrifice for others. At present I can think of no better plan than the well-earned favorable mention in the columns of Coal Age, giving an account of the brave acts performed and the photograph of the one who sacrificed his own personal safety in the hope of saving another. This would acquaint thousands of miners with the story and inspire them with the spirit of doing for others what they would have others do for them under like conditions.

John Rose,
District Mine Inspector.

Dayton, Tenn.

Letter No. 13—The suggestion in regard to the recognition of heroism in coal mining, made in Coal Age, Jan. 16, p. 109, was a timely one and is deserving of the most earnest consideration on the part of every man connected in any way with the coal-mining industry. Almost every other trade or calling in which hardy men engage has some sort of provision for the suitable acknowledgment of courageous acts, particularly where the object is to save life.

Probably no other calling presents the same opportunity for the display of man's noblest attributes as coal mining, which fact is quite generally recognized. In common with most mining men, I favor the formation of a board, or commission, having for its object the careful consideration of this work in its relation to the mining of coal. The means and methods to be adopted would have to be worked out in actual practice. However, I would suggest a word or two regarding certain features that it might be well to bear in mind.

1. Care should be taken not to inaugurate a plan that would foster foolhardiness in rescue work.

2. A purely impulsive act, although heroic in its nature, should be given its rightful place; as such act naturally possesses less merit than a cool deliberate setting aside of any thought of one's own danger, in the reasonable hope of rendering assistance or saving another who is in peril.

3. The loss of life, or permanent injury by which the would-be rescuer is incapacitated for future work, would call for special consideration in any recognition accorded the act.

As is well known, the heroes of a mine are quite generally men of small income and dependent on their daily toil for the support of self and family. On this account I feel that the results to the one who makes the sacrifice and risks his own safety for that of another should receive due consideration. In this connection I may be pardoned for referring briefly to a personal experience that affords an illustration of the need of such consideration as I have mentioned.

It was at the time of the terrible Harwick disaster of Jan. 25, 1904, when 179 men lost their lives in an explosion that wrecked the mine. Cages, ropes, fans and every essential for the working of the mine were destroyed. It was before the day of the universal use of the oxygen helmet or breathing apparatus and the efficient mine-rescue organizations that have since been formed. Strong hopes were entertained by the men on the surface that some, at least, of their comrades below would be found alive and could be saved if brought out promptly to fresh air. Everything depended on prompt action, which is the case generally on such occasions. Even today, when rescue work is well organized, it frequently happens that the hope of rescue depends on the men who crowd the entrance of the mine immediately after the explosion.

In the present instance many of us in that crowd of willing volunteers had wives and families. It so happened that two of us lived very close to each other, and doubtless the same thought was uppermost in each of our minds: What would become of those at home should we lose our lives in the attempt to save those in the mine? Would the dear ones at home, as the result of our decision, have to pay the same costly price, or would a grateful government or community care for them as the soldier's widow and children are cared for today? In the full consciousness of the possible results we took the risk, but I ask in all earnestness, Would not our decision have been more easily made had this doubt that I have mentioned been removed from our minds?

What transpired that day below ground is a matter of record and need not be repeated here. Suffice it to say that my comrade, John Lyle, paid for his decision by the loss of his life, while I was spared. What might have been the terrible results to those dependent on him has often been in my thoughts, but a well-known philanthropist of the same nationality as Lyle rewarded the act of his countryman by assuming the care of his bereft family. I want to ask, Had my life been forfeited, as well it might have been but for the providence of God, what would it have availed my wife and family had they been presented with a medal and a bit of silk ribbon to console them for the loss of the breadwinner of the family?

In closing, permit me to say again that since, as almost invariably happens, the saving of the lives of those entombed in a mine by disaster depends on the prompt self-sacrificing work of those who crowd the top of the shaft immediately after the accident, any suitable recognition of the volunteer's service must consider the results to those who are bereft in the event of his death or who are left helpless if he is incapacitated for work. For the man who survives, a medal or other simple acknowledgment of his brave deed is very well and all that would be expected. But for the dependents of one whose life has been sacrificed in a reasonable attempt to save others something more practical should be devised. I believe that the suggestion made in Coal Age will yet take more concrete form and that the coal industry itself will see to it that a suitable and adequate provision is made to meet this exigency.

Houston, Penn.

Mining Laws and Legislation

Letter No. 2—One of the most interesting and important points brought out in the recent discussion of mining laws was that referred to in Letter No. 41, Coal Age, Apr. 3, p. 613, and Letter No. 42, Apr. 10, p. 650, regarding the danger of working in a gaseous mine as compared with that in a mine having a bad roof.

Special emphasis was laid on the need of more frequent inspection in mines worked under a bad roof. Such frequent inspection is required by law in all gaseous mines, but is practically ignored in most mining laws, in respect to bad-roof conditions. Mr. Hogarth, in Letter No. 41, draws attention to the larger number of accidents that occur from falls of roof and coal than those due to the explosion of gas in mines, as shown by mining statistics.

I do not wish to be understood as being opposed to the frequent and thorough inspection of mine workings, but I feel that the benefits to be derived from such frequent inspection are often overestimated by its advocates. It must be remembered that inspection alone does not remove danger. A more frequent inspection *may* have the effect of promoting a false sense of security on the part of the miner. I have drawn attention to this fact in a previous letter on "Safety Hints," Coal Age, Apr. 3, p. 612.

The fact is well known that men working under a treacherous soapstone roof are continually on their guard, even when the roof appears safe. They realize by experience the importance of so doing. Under these conditions, a morning examination would be of no avail inasmuch as the danger is a constantly recurring one, and the watchful miner is his own best safeguard. Then, while advocating frequent inspection of mine workings, let us place equal emphasis on the necessity for stringent mining laws and legislation, in respect to such subjects as timbering, lighting and full compliance with the existing laws and mine regulations.

I have always been deeply impressed with the need of a more practical classification of coal mines. I have referred frequently to the fact that mines should be classified rather on a basis of being "nonhazardous," "hazardous" or "extrahazardous," without regard to what cause is responsible for the danger implied in such classification. The danger in any particular case may be due to the presence of gas, dust or bad-roof conditions. Such a classification would possess the decided advantage, however, that similar demands and burdens would be required in each case in proportion to the danger to be encountered in the operation of the mine.

The following citations from the Ohio mining laws (1914) may be of interest in this connection:

> Sec. 952. . . . He (the mine foreman) shall examine each working-place or have it examined by his assistant at least once each alternate day that persons are or should be at work therein and oftener when, in his judgment, the circumstances require.
>
> Sec. 953. He shall see that the working-place of each miner is kept supplied with props of approximate length, caps and other timbers necessary to securely prop the roof thereof. When he examines the working-place he shall observe the condition of the roof and timbering and instruct the workmen therein as to the proper method of timbering for the security of the roof.

These and other references in the law make the mine foreman responsible for such an inspection of each working-place as will make it safe for the men employed therein, without reference to the particular nature of the danger that may exist there.

GEORGE N. LANTZ.

New Straitsville, Ohio.

Rescue Work at Royalton, Ill.

Permit me to correct one statement made in your editorial entitled "Royalton, Ill., Rescue Work," COAL AGE, Apr. 24, p. 729. The second paragraph states, "No one was saved." This is incorrect, for the men wearing oxygen apparatus discovered a man, at about 4 o'clock in the afternoon, in room 25 off the second-north entry. He was reclining on his powder box, still alive. He was in a semidazed condition, but, on being carried to fresh air, revived sufficiently to be taken to his home and has since fully recovered.

With the exception of about five others, this man appeared to be the only man, in the area affected by the explosion, who was not instantly killed. The positions in which a few of the men were found indicated that they had not been killed by the direct force of the explosion, but had succumbed in their efforts to reach fresh air immediately after the explosion took place.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

Influence of Coal Dust on Explosion—The fine dust of an inflammable coal when floating in the mine air may render the air explosive in the entire **absence of explosive gas.** Under such conditions, however, the ignition and explosion will only take place when the floating dust is acted upon by a flame of considerable volume and intensity.

When a **small percentage of methane** is present, insufficient of itself to make the air explosive, the presence of the dust floating in the air is more dangerous than when no gas is present. The dust-laden air is **more easily ignited** and the force of the resulting explosion is increased in proportion to the inflammability of the mixture.

The **purity, fineness, humidity** and **inflammability** of the dust are important factors in determining the character of the explosion, since these with oxygen are the chief elements that promote the rapidity of the combustion, which is the necessary condition of any explosion.

The suspended dust **feeds the flame** of an explosion that is started in a mine, and thus serves to propagate the blast and extend what would otherwise have proved only a local explosion. This **action is cumulative** in a dry and dusty mine. The dust lying on the roads and clinging to the sides and timbers of the passageways is blown into the air by the force of the rushing wind that precedes the explosive wave, producing what has well been called a **"pioneering cloud"** of dust that is itself highly explosive.

The **weight of fine bituminous coal dust** required to render normal air explosive has been variously estimated. Tests made at the Pittsburgh Experiment Station with dust from a 200-mesh sieve showed explosion took place in a density of 32 grms. per cu.m. (0.032 oz. per cu.ft.) or, say 1 lb. of dust in 500 cu.ft. of air. The Taffanel experiments (Liévin) gave explosion in 70 grms. per cu.m. (0.07 oz. per cu.ft.) or, say 1 lb. of dust in 230 cu.ft. of air. In one instance only, explosion occurred in 23 grms. per cu.m. (0.023 oz. per cu.ft.).

It is quite evident, as experiments also show, that conditions in respect to the **purity, humidity** and particularly the **inflammability** of the dust are so variable that the question of the density of the dust cloud has only an experimental value. The size of the workings, as determining the conservation of heat and pressure, will also modify the results in the mine.

Theoretically, since the atomic weights of carbon and oxygen are 12 and 16, respectively, 1 lb. of carbon will yield

$$\frac{12 + 16}{12} = \frac{28}{12} = 2\tfrac{1}{3} \text{ lb. carbon monoxide.}$$

But, carbon monoxide measures 13.5 cu.ft. per lb., at normal temperature and pressure. Hence, $2\frac{1}{3}$ lb. of the gas or the yield of 1 lb. of coal dust would form $2\frac{1}{3} \times 13.5 = 31.5$ cu.ft. Then, since the lower inflammable limit of carbon monoxide is when the mixture of gas and air contains 8.4 per cent., **inflammation** might be expected when the dust present was 1 lb. in $31.5 \div 0.084 = 375$ cu.ft. of air. Also, the lower explosive limit of the gas being when 16.5 per cent. of gas is present, **explosion** might be expected when there was 1 lb. of dust in $31.5 \div 0.165 = 190$ cu.ft. of air.

The Coal Age Pocket Book

Inflammability of Coal Dust—The inflammation of a dust cloud in mine workings, under like conditions, depends largely on the inflammable nature of the coal. The experiments at different testing stations have demonstrated that the **volatile combustible matter** contained in coal is a fair index of its susceptibility to inflammation when held in suspension as fine dust in the air.

Experiments performed with **anthracite dust** seem to indicate that the fine dust of that coal is not capable of propagating an explosion in a mine, under ordinary mining conditions. This fact points significantly to the conclusion previously stated that the volatile combustible matter in a coal is an important index of its explosibility. It is not asserted or claimed that anthracite dust cannot be exploded under favorable conditions. However, the conditions that would cause anthracite dust floating in the air to explode are not liable to occur in ordinary mining practice.

Influence of Shale or Stone Dust—Shale or other soft rock of the coal formations have been ground to a fine powder for use in mines and, in this form, have been sprinkled on the roads in a manner to form **stone-dust zones,** or distributed on shelves hung across and overhead in the entries to form so-called **stone-dust "barriers."**

The purpose of these dust zones and barriers is to **arrest the progress** of an explosion should one occur in the mine. Their use, however, has not been attended with **unvarying success,** which is due in part to the different conditions of temperature, humidity, air space or volume of mine workings available for expansion, inflammability of the gas- and dust-laden air and the initial intensity of the explosion; also, in part to the limited extent or adequacy of the dust zone or barrier as compared with the strength developed by the explosion.

Notwithstanding the **apparent failure** of these means for preventing the spread of an explosion in a mine in many observed instances, there is no question but that finely powdered shale or stone dust blown into the path of an explosive wave by the pioneering impulse, or suspended in the air with the inflammable coal dust has a most decided effect and **reduces explosive conditions.**

The **action of incombustible dust** suspended in an otherwise explosive atmosphere to allay the explosiveness of the mixture or reduce the violence of the blast should ignition and explosion occur is **wholly physical.** The incombustible particles disseminated through a dust-laden atmosphere separate more widely the inflammable particles of coal dust and dilute the air necessary for combustion. In other words, the percentage of inflammable matter in the mixture is reduced and the **liability to inflame** diminished in the same proportion.

Also, by its **absorption of heat,** the incombustible matter lessens the heat available for ignition and decreases the heat energy developed when ignition has taken place. The action is entirely similar to that of the inert nitrogen of air depleted of its oxygen, or to the extinctive effect of carbon dioxide when present in firedamp mixtures, both of which conditions act to diminish the explosibility of gaseous mixtures.

Inquiries of General Interest

Coal Deposits of South America

Can you give me any information in regard to the coal-mining districts of South America, stating where these are located?

JOHN S. WILLIAMS.

Cumberland, B. C., Can.

The Executive Committee of the Twelfth International Geological Congress selected for its chief subject of discussion, "The Coal Resources of the World," and in response to a specially prepared circular sent to the directors of the geological surveys and mining bureaus throughout the world they received valuable reports on the coal resources in the several countries of the globe. Later a summary of these reports was published in three volumes. The following information is taken from the first of these volumes:

The coal formations of Colombia are largely Cretaceous, although there are small areas of coal-bearing rocks in the Paleozoic formation. The probable reserve is estimated at 27 billion tons of bituminous coal.

The report states that in Venezuela bituminous coal is mined on a small scale at Naricual, near Barcelona, and at Coro, 12 or 15 mi. from the seaport of La Vela. The Naricual coal area extends from the River Querecual on the south to the mountain chain of Naricual on the north. This area is estimated to contain 200,000 sq.mi. and is underlaid with several seams of coal varying from 3 to 9 ft. in thickness.

There are no coal mines in operation in Ecuador, although considerable deposits of coal have been found in several places. Samples of this coal examined in the United States and England have been pronounced of excellent quality, but the lack of transportation facilities has prevented the development of the deposits.

Coal is one of the abundant natural products of Peru, where it is found in 15 principal belts or seams, which contain a probable reserve of 1,000,000,000 tons of commercial coal. The deposits have not been developed to any extent.

Coal in thin seams is known to cover a large area in southern Brazil. These seams, however, are split by numerous partings. The coal also contains a high percentage of ash and sulphur. The measures belong to the upper Carboniferous and Triassic formations. These deposits also extend into Argentina, where the reserve is estimated at about 5,000,000 tons of bituminous coal.

The coal seams of Bolivia are found embedded in thick strata of sandstone that resemble the millstone grit. These seams are thin, and although the coal has a fair calorific value, it contains many impurities.

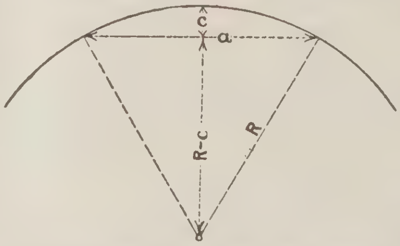
Little is known of the coal deposits of Uruguay. There are no outcropping seams in this republic, although some coal has been reported recently in borings made near the northern border.

The coals of Chile probably all belong to the Tertiary, although some may be Cretaceous. In the neighborhood of Quiriquina Island there is an estimated coal area of about 60,000 sq.mi., which is largely submarine. The coal in this area is mostly lignite, the seams ranging from 1 ft. to 2 ft. 7 in. in thickness. The best coal, however, is found in the vicinity of Santa Maria Island, where three seams, aggregating a thickness of 9 ft. 9 in., underlie an area of about 700,000 sq.mi. This coal burns with a smoky flame and contains from 50 to 60 per cent. of fixed carbon, the ash varying from 2 to 11 per cent. Lignites of inferior quality occur at many points in southern Chile, while anthracitic coal of probably Mesozoic age, having a conchoidal fracture, metallic luster and burning without flame, is found at various points in the Andes.

※

Geometry of the Circle

Kindly publish in the inquiry department of COAL AGE the correct formula for finding the radius of a circle when the chord and the middle ordinate are given, as indicated in the accompanying figure, where a is the chord and c the middle ordinate.



CHORD AND MIDDLE ORDINATE OF CIRCLE

The formula I have, as taken from a textbook, is

$$R = \frac{c}{2} + \frac{a^2}{Bc}$$

I want to ask what is meant by Bc, which does not appear in the figure.

STUDENT.

Brier Hill, Penn.

The formula as given above is incorrect and probably contains typographical errors that make it unintelligible. The correct rule for finding the radius of the arc of a circle when the chord and the middle ordinate are given, is as follows:

RULE—*Divide the sum of the squares of the half-chord and the middle ordinate by twice the middle ordinate.*

Expressed as a formula, this rule is

$$R = \frac{(\frac{1}{2}\,a)^2 + c^2}{2\,c}$$

This formula is developed from the rule for finding the hypotenuse of a right triangle whose sides are known. In this case, the hypotenuse is the radius of the circle, and the two sides are the half-chord and the radius less the middle ordinate.

The operation is as follows:

$$R^2 = (\tfrac{1}{2}\,a)^2 + (R - c)^2$$
$$R^2 = (\tfrac{1}{2}\,a)^2 + R^2 - 2\,Rc + c^2$$
$$2\,Rc = (\tfrac{1}{2}\,a)^2 + c^2$$
$$R = \frac{(\frac{1}{2}\,a)^2 + c^2}{2\,c}$$

This formula is particularly useful in surveying, for calculating the required degree of curve.

Examination Questions

Miscellaneous Questions

(*Answered by Request*)

Ques.—What are the dangers incident to dry and dusty mines, and how would you guard against them? Answer fully.

Ans.—The danger that exists in a dry and dusty mine is that a possible blownout or windy shot will throw a quantity of the dust into the air. This would probably be ignited by the flame of the shot and a local explosion result. If any gas is present the danger is much increased. The fine dust thrown into the air by the ordinary operations in the mine will be suspended in the air current and the explosive condition of the mine much increased.

In order to avoid as far as possible the danger of the ignition of dust in a mine, it is necessary to avoid all accumulations of fine dust on the roadways and fine coal and slack at the working-face. It is necessary for this purpose to use dust-proof cars for hauling the coal in the mine and to load out the fine coal and slack regularly at the face. It is also necessary to establish an efficient spraying or watering system throughout the mine.

Where blasting is performed, every precaution should be taken to prevent the occurrence of a windy or blownout shot. The working-face and the sides, roof and floor should be sprinkled thoroughly before a shot is fired. All shots should be inspected, charged and fired by authorized shotfirers, who should condemn any shot that is deemed unsafe. It is important to use efficient means for the humidification of the mine air. This is best accomplished by heating the intake air previous to discharging steam into the current as it passes into the mine. This humidification of the air prevents, to a large extent, the drying out of the mine owing to the absorption of moisture by the current.

Ques.—A large percentage of mine accidents is caused by miners persisting in loading coal where the roof is unsafe. What rule would you adopt to prevent this condition and reduce the number of accidents?

Ans.—Rules are without avail unless rigidly enforced, and the enforcement of mine rules requires a close inspection and suitable penalties for any violation of the same. In order to avoid as far as possible accidents of this nature, every working place should be inspected by a competent person before the workmen are allowed to enter the mine. Every miner should also be required to examine his own roof immediately upon entering the place and before proceeding to load coal or do other work. If timber is needed he should be required to set the posts at once, and if the necessary timber is not on hand he should not be allowed to work in the place until he has secured the same and complied with the regulations. Every miner should be compelled to keep on hand two or three extra posts ready for immediate use when needed. All orders for timber should be promptly delivered at the points where they are required for use. When a room or chamber is "working," it should be closely watched, and if considered dangerous the men should be made to stay out until the roof again became quiet.

Ques.—In working a dusty mine, where marsh gas is given off and firedamp generated, what steps would you take to guard against accidents from explosions?

Ans.—The mine should be opened on the triple-entry system or the main entries should be driven four abreast. The center entry or entries should be made the main intake and the flanking entries the main-return airways for their respective sides of the mine. The mine should be divided into separate ventilation districts and should be worked exclusively with safety lamps. All accumulations of dust should be avoided. The working places and the roads and passageways should be cleaned regularly. An effective spraying system should be installed throughout the mine. Means should be adopted to humidify the intake air, which should first be heated by allowing it to pass over a system of steam pipes, so that it will absorb a larger quantity of water than would otherwise be possible.

Shotfirers should be employed to prepare and fire all shots except those that are in their opinion unsafe, and these should be condemned. Strict regulations should be enforced in regard to the use of safety lamps, and no one should be entrusted with the use of a lamp until he fully understands how it should be handled and under what conditions it is *unsafe*. At the end of each shift, all lamps should be returned to the lamphouse, where they should be cleaned, examined and put in readiness for use the next day, by a competent person in charge.

Ques.—What would be the cost of pumping 1000 gal. of water per min. to a height of 1000 ft., using a centrifugal pump driven by an electric motor, assuming the motor has an efficiency of 90 per cent. and the pump an efficiency of 72 per cent? The cost of the current is 1c. per kw.-hr.

Ans.—The first step is to calculate the size of the column pipe required for a velocity of, say 400 ft. per min., and from this find the frictional head, for the given quantity of discharge. The diameter of column pipe, for a velocity of about 400 ft. per min., is,

$$d = 0.25 \sqrt{G} = 0.25 \sqrt{1000} = say\ 8\ in.$$

The friction head due to a flow of 1000 gal. per min. through this pipe is

$$h_1 = \frac{f l G^2}{8 d^5} = \frac{0.01 \times 1000 \times 1000^2}{8 \times 8^5} = 38\ ft.$$

The actual head being 1000 ft., the total head against which this pump must operate is 1000 + 38 = 1038 ft.

Now, assuming that 1 gal. of water weighs $8\frac{1}{3}$ lb., and taking the efficiency of the pump as 72 per cent., and that of the motor as 90 per cent., since 1 hp. = 0.746 kw., the input of the motor is

$$Kw. = \frac{1000 \times 8\frac{1}{3} \times 1038}{0.90 \times 0.72 \times 33{,}000} \times 0.746 = say\ 300\ kw.$$

At a cost of 1c. per kw.-hr., the cost, in this case, will be $3 per hr.

Coal and Coke News

Harrisburg, Penn.

Anthracite mine workers are behind the bill introduced in the Senate on Apr. 28, by Senator Beidleman, which calls for the election by the people of 21 assistant mine inspectors.

The bill provides that there shall be 5 assistant mine inspectors in Lackawanna County, 6 in Luzerne; Carbon, 1; Schuylkill, 4; Northumberland, 2; Columbia, 1; Dauphin, 1, and the counties of Susquehanna, Wayne and Sullivan, a separate district, 1.

A salary of $2000 per year is provided for each assistant. The work of the assistants would be confined entirely to seeing that the mine laws relative to ventilation are obeyed and that particular attention be paid to the circulation of air at working faces where men are employed.

If the bill becomes a law, the judges of the several Courts of Common Pleas in the anthracite region would name the first set of assistant mine inspectors. In November their successors would be elected for terms of four years. Any mine employee, aged 30, and with 10 years' actual experience in and about the mines, 5 years, at least, of which were spent in cutting coal at the face of breast, chamber, etc., would be eligible for the assistant inspectorship.

To encourage the further development of the mineral resources of the state, a bill, which is thought to be backed by the administration has been introduced by Senator McGee. The bill provides that the Secretary of Internal Affairs on application to him made to issue his warrant for not exceeding in quantity 100 acres to any one person, any coal or other minerals under the rivers of the state.

That from and after the issuing of said warrant the right to dig or mine coal, iron, limestone, etc. . . . shall vest and be in the party in whose favor the said warrant or warrants shall issue. Provided, That he shall exercise the said right, as not in any way to interfere with the free navigation of any river or with the rights of any person or persons holding property on the banks thereof. Provided also, That nothing contained in this act shall authorize any person to undermine the bed of any river, the navigation of which has been improved by the Commonwealth, within one hundred yards from any dam or lock necessary to said improvement without the consent of the Secretary of Internal Affairs, and nothing contained in this proviso shall in any way be construed to affect any rights now vested under existing laws. And provided also, That the Commonwealth shall have the right after 20 years from this date to revoke any such warrant or grant on payment to the party, his heirs or assigns, holding the same, the original purchase money and the original costs of his works, engines, et cetera, such power of revocation only to be in force where there is any improvement made.

That the person or persons so holding said warrant or warrants, his heirs or assigns, shall and may at any time within 10 years from the date of the same have and receive a patent for the said land under the seal of the Commonwealth in the proper form granting them, their heirs and assigns, all the right, title and interest of the Commonwealth and the right to dig and mine iron, coal, limestone, sand and gravel, fire clay or any other mineral on his or their property, paying into the treasury of the Commonwealth the price of $100 per acre and the usual fees with interest from the date of said warrant subject to the restrictions contained in the 2nd section of the Act. And provided, That nothing in this Act shall prevent or be a bar to any indictment for any nuisance or injury done by any person or persons, so exercising said rights to any public or private property or for any impediment to the full and free use of any of the said rivers.

A Hearing Was Granted

The House Committee on Mines and Mining recently granted a hearing to the operators and mine workers on the Catlin Bill No. 160. Roger Devers represented the miners and James P. Torrey the operators.

Principally, the contest was on an amendment proposed by the operators to postpone the date when the bill will become effective until next January, to make it operative at the same time with the compensation bills.

Several amendments were agreed upon, one to define the term of miner, to include everybody working in the mine, another to eliminate the provision that the mine foreman must have 5 years' experience in cutting coal, and a third that legal representatives of injured families may have the right of inquisition at a coroner's inquest. The bill was referred to a sub-committee, comprising Representatives Milliron, Armstrong; West, Cambria, and Jones, Susquehanna. Two of the committee representing bituminous counties and the other a farming district.

The Anthracite Coal Tax Is Held Constitutional

Judge Kunkle, of the Dauphin County Court (sitting in Harrisburg), on Apr. 30, filed opinions upholding the constitutionality of the anthracite coal tax act of 1911, and directing judgment for the Commonwealth in the appeals of the Alden Coal Co., and Plymouth Coal Co., operating in Luzerne County and the St. Clair Coal Co., operating in Schuylkill County, from the settlement of taxes made by the Auditor General and State Treasurer. The actions involve approximately $5,000,000 in tax and it is understood that appeals to the Supreme Court will be filed within a few days.

The main opinion is in the Alden Coal Co. case, and the judge says in the course of the opinion, "We are of the opinion that the classification of anthracite coal for taxation is a legitimate one and that the taxation of such coal as distinguished from all other kinds of coal is not a violation of the constitutional provisions referred to."

The court holds that the title of the act is not defective and that it gives proper notice of what the statute contains and that the act does not contain more than one subject. While in some respects the act is declared to be crudely drawn an examination leaves no doubt of legislative intention. The court holds that the act is not local or special legislation and that it does not purport to legislate for one particular locality. Anthracite coal may be found in other counties in the future, says the court, and if the act referred to all coal the same objection might be raised to it because the coal is not found in many counties of Pennsylvania at all. The act is declared to be a statute to raise revenue for the state and does not regulate the affairs of any county or municipal division.

On the objection that it imposes double taxation because the coal companies pay a state tax on capital stock the court says the power of the Legislature to impose double taxation is "well settled."

In any event the coal might be shipped out of the state limits before the period of appraisement and the producers thus avoid payment of a double tax because if it was not owned it could not be included in property taxable for state purposes. That it would not be a uniform tax because the amount returned would relieve municipalities from some burden of taxation, by saying that the citizens will still be subject to local and state taxation and that the relief is not prohibited.

On the plea that the act is confiscatory the court says, "If the purpose for which the tax is levied is a public one there is no doubt as to the power of the Legislature to impose the tax. The statute does not present the case where the property of one is taken and applied to the use and benefit of another, but presents the case where the property is taxed by the Commonwealth and the revenues thus raised are distributed where, in the judgment of the Legislature, it seems right and proper." The court holds that the purpose of the taxation being a public one, the Legislature had the power to levy and distribute it.

The court says that it is unable to see how the act conflicts with the Federal Constitution. The coal becomes subject to tax when prepared for market or before it is started out of the state.

In passing on the last objection of the list filed the court says that if there is any valid objection to the sufficiency of the appropriation clause "its defects are open to remedy by the Legislature and without it the rest of the act can stand."

At present there is pending in the Legislature a bill to provide a new anthracite tax of 2½%, ad valorem, with requirement of an equal distribution of the tax between the state and the municipalities producing anthracite coal. The act upheld distributed 50 per cent. of the tax among counties producing the coal. The proposed act before the Legislature, specifically states that the money received by the state is to be used for highway purposes.

Conference on Compensation

Mine workers are awaiting with considerable interest the conference to be held between the Governor and 26 senators on the compensation acts now pending in the Senate. The members of the lower house are watching what the senators do as the action of the Senate must be approved by the House.

One of the points that is disturbing some of the senators is the provision of the bill which deprives the employer of his common law defenses in case he does not choose to "voluntarily" accept the provisions of the workmen's compensation acts. The common law defense includes the "contributory negligence," "fellow servant" and similar pleas. It appears some apprehension has been manifested among operators and manufacturers in regard to this provision, and the senators have been hearing from employers "back home." A number of other points will be brought up in the conference.

It is said the Senate may not undertake to act finally on the compensation bills. Some amendments are almost certain to be made following the conference with the Governor, and this would necessitate reprinting one or more bills, which would defer the possibility of action for several days. It is even stated around the capitol that a public hearing may be held on the bill during the week of May 10, which would accord with the report that the Senate leaders are in favor of holding off final adjournment until after May 13.

PENNSYLVANIA

Anthracite

Mahanoy City—Possibly the first cash penalty since the Conciliation Board of the anthracite region was created in 1902 was decreed on Apr. 30, when ex-Judge George Gray, of Wilmington, Del., umpire of the peace body, ruled that the Lehigh Valley Coal Co. must pay Joseph Levancavage, of Buck Mountain colliery, $75 for his unjust discharge. Levancavage was dismissed by the mine foreman because he insisted he had not been paid the proper yardage. The company discovered Levancavage was right. Levancavage asked for three months' pay for the time he was idle.

Mauch Chunk—Officials of the Lehigh Coal & Navigation Co. have employed skilled woodmen to patrol Broad Mountain, between Beaver Meadow and here, in an effort to check the forest fires that threaten to devastate enormous supplies of timber.

Hazleton—John A. Moffitt, of Washington, D. C., and James A. Steese, of Harrisburg, representing, respectively, the Federal and State Departments of Labor, are to act as mediators in the settlement of the strike of the 200 stripping hands of Contractor James Duggan. The men quit some time ago because, as they claimed, a certain number of the employees were not paid in full for their work in March. The management denied the charge, and declared that all the men had received every cent due them. As neither side would yield, it was agreed to have outsiders adjust the dispute.

Sunbury—Judge Frederick B. Moser, of the Northumberland County Court, on Apr. 26 refused a new trial in the case of John Rodel, of Shamokin, who recovered $4000 damages from the Philadelphia & Reading Coal & Iron Co. for the loss of a leg which he suffered when kicked by a mule. The plaintiff alleged that without his knowledge he was given a vicious mule while at work at the North Franklin colliery, and that the mule without warning kicked with much force, throwing him over a pile of ties and under a trip of cars, which cut off his right leg. The coal company denied negligence and contended that it had no way of telling that the mule was gentle.

Ashley—Twelve hundred men and boys were thrown out of work at the Maxwell No. 20 colliery of the Lehigh & Wilkes-Barre Coal Co. on Saturday, May 1, when 100 "door boys and patchers" decided to strike in order to play baseball. The action was taken when Burgess J. K. Fenner, of the borough, notified the boys that Sunday baseball would be prohibited. The boys replied that they would keep the colliery idle every Saturday to play ball if the order is enforced. The colliery officials were unable to effect a settlement.

Nesquehoning—In one day recently 1703 loaded cars were dumped into the Lehigh Coal & Navigation Co.'s breaker here, breaking the former record of 1625 cars.

Duryea—A. B. Brown has filed suit against the Delaware, Lackawanna & Western R.R. Co. and asks damages of $2000. He charges that the coal company is pumping sulphur water from the Halstead colliery and permitting it to flow onto his land, destroying its value as a building plot.

Bituminous

Washington—Carmine Cicci has brought suit against the Diamond Coal & Coke Co., asking $8400 damages alleged to be due for the unlawful mining of coal from under his tract of land, and for surface damage incurred as a result of these mining operations. The sum of $2400 is asked for the coal removed, while the balance, or $6000, is claimed as damages to real estate and buildings.

Connellsville—Production of the Connellsville coke region is approximately 300,000 tons per week, while the demand is slowly increasing. Furnace coke is, however, standing still while the merchant business is growing steadily.

Latrobe—Marcus W. Saxman, head of the Latrobe-Connellsville Coke Co., has disposed of his holdings to capitalists allied with the Keystone Coal & Coke Co. The main offices of the firm will be moved to Greensburg. Edward Soppitt, general superintendent of the company will continue as the active field manager while the engineers and other officers will make the Latrobe offices their headquarters.

The big fan house at the Latrobe-Connellsville mine of the Latrobe-Connellsville Coal & Coke Co. located near Superior No. 2 was recently destroyed by fire entailing a loss of about $5000. A repair shop located nearby was also destroyed. It is believed that the fire originated in an over heated bearing, while the flames had gained such headway before discovery that there was no chance of saving the building. Plans for a new fan house are now being prepared, and the structure will be erected at once.

Uniontown—The Orient Coke Co. recently fired 250 ovens, this number being approximately 60 per cent. of the entire installation. It is expected that increases in the number of operating ovens will be made from time to time until full capacity is attained.

WEST VIRGINIA

Williamson—The Pond Creek Coal Co. is advertising for men, and all its mines will be run on full time shortly. This firm is one of the largest coal operators in this immediate vicinity.

Welch—The jury in the coroner's inquest held to determine how and by what means three men met death in the Davy-Pocahontas coal mine explosion a few days ago, returned a verdict that the men were killed through disobeying the mine foreman's instructions. These instructions were not to enter the mine until it had been ventilated and the fan started.

Huntington—At a recent meeting of the mines and mining committee of the local Chamber of Commerce, additional plans were agreed upon in connection with the safety and mine rescue meet to be held at League Park, May 14. Arrangements for an elaborate pageant preceding the demonstration were formulated and minor details discussed.

More than 300 men it is estimated either have already or will shortly leave Huntington and surrounding territory for Kentucky to work in the mines of the Consolidation Coal Co. It is said that over a thousand men are needed for these mines. Of the 12 mines owned by this firm on Elkhorn River, six are now running and four more will be started immediately, while the scarcity of labor is all that is preventing the opening of the remaining operations.

The West Virginia Coal Association recently perfected its organization by vesting all governing power in an executive committee of which W. D. Ord of Langraff, W. Va., is chairman, and A. H. Land, of Barbourville, secretary.

Fairmont—New orders for several hundred thousand tons of coal have been received by the Consolidation Coal Co. for delivery to the lakes as soon as possible. This means that the local firm will not only work the mines already in operation, but put other plants in commission. The new orders assure that activity in the mining industry of the Fairmont region will be better this summer than for many years in the past. The outlook is therefore bright.

Wheeling—Heretofore all shipments of coal from this section have been consigned west of Wheeling. The opening of the Lake trade a short time ago started coal moving in that direction. Recently, however, a new market has been secured on the Atlantic seaboard, and a few days ago the Baltimore & Ohio R.R. carried the first consignment of Marshall County coal to Baltimore.

KENTUCKY

Whitesburg—The Elk Horn Mining Corporation is preparing to resume its operations at Haymond after six months of idleness. More coal is said to be going out of this section over the Lexington & Eastern than ever before.

Barbourville—Second hearing of the case of Elijah Young's administrators against the North Jellico Coal Co., of Louisville, resulted in a change from the first verdict of $12,000 damages to a finding for the defendant, the second trial having been granted at the request of the plaintiff. Suit was for $25,000, Young having been killed while in the defendant's employ. He was seated on a plank between two cars, it is alleged, when the accident occurred, and the jury decided that his death was due to his own negligence, not to that of the company.

Middlesboro—Coal operations in Middlesboro have shown more activity recently than for some time. The Wasioto & Black Mountain R.R. and the Straight Creek lines have been loading out over 300 cars a day, it is said. An extra freight train has been run on the Louisville & Nashville lately to take care of the increased business toward Corbin.

Pineville—The fourth annual meeting of the Kentucky Mining Institute will be held at Pineville, Friday and Saturday, May 14 and 15. In connection with this meeting there will be a state-wide first-aid meet. The committee in charge is endeavoring to make this meet the largest and most attractive ever held in this state and invites teams to participate. Valuable prizes have been offered, among which are included various sums in cash aggregating $100, mining lamps, wearing apparel and groceries. It is probable the American Mine Safety Association will offer medals to teams having the highest average.

OHIO

New Straitsville—The Troy mine near New Straitsville, which has been burning since the strike of 1884, has communicated the flames to the Jones Bros. mine, which started to burn last week. The Jones shaft will have to be abandoned and the property loss will be large.

Columbus—The joint resolution offered in the Ohio Senate by Senator Vorheis, empowering the Ohio Utilities Commission to investigate the question of freight rates on coal shipments in intrastate traffic, has been killed. Senator Vorheis at first desired the passage of a law regulating rates, but when it was defeated he substituted the joint resolution which met a similar fate.

Coshocton—Quite a few mines in the Coshocton field were opened last week after an idleness of more than a year. Two forces of men have been placed at work at the Warwick mine to get it in shape for operation. The three mines of the Barnes company are all in operation. Other mines are also working.

Martins Ferry—The Pittsburgh Standard Coal Co. has closed the contract for the sale of a large tract of coal with a mile of frontage along the Panhandle division of the Pennsylvania R.R. near Burgettstown, Penn. The purchasers have formed the Bertha Coal Co., while the land purchased is one of the few important tracts not worked in Washington county. It is expected that within a short time the newly organized company will close the deal.

INDIANA

Lafayette—The Chamber of Commerce has filed a protest with the Interstate Commerce Commission against the proposed increase in freight rates on shipments of Kentucky coal to Indiana points. The proposed increase is 9c. a ton. The increase does not apply to West Virginia coal, and the new rate is therefore regarded as a discrimination in favor of the West Virginia product.

Indianapolis—Notice that more than $6,000,000 due on bonds must be paid by the Dering Coal Co. or else the Indiana property of the company will be sold at auction May 21, at Terre Haute, Ind., has been filed with the clerk of the United States District Court at Indianapolis. The company has property in Sullivan, Vigo and Vermillion counties. The decree issued was entered in the suit brought by the Continental & Commercial Trust & Savings Bank of Chicago against the coal company, the plaintiff holding a mortgage securing a bond issue for $4,664,000, interest payments defaulted since Apr. 1, 1909, amounting to $1,559,294, and receiver's certificates issued amounting to $91,373.

ILLINOIS

Chicago—The first steps toward the reorganization of the Dering Coal Co., said to own the largest tract of coal land in the country, were taken May 1, when Attorney Levy Maer on behalf of the Continental & Commercial National Bank of Chicago, and Kuhn, Loeb & Co., of New York, bought stocks and bonds to the face value of $7,000,000 at auction for $681,500.

Princeton—On petition of J. H. Walsh, trustee, Judge A. Davis recently appointed Albert Whitehead, of Canton, Ill., receiver for the La Salle-Hennepin Coal Co. This is a friendly law suit to keep the affairs of the company in their present condition until a plan can be perfected to dispose of the property and pay the debt. It is considered quite possible that the mine may be reopened in the near future.

Springfield—There appears to be a well founded rumor to the effect that several thousand acres of coal land south of Springfield, located along the Chicago & Alton R.R., will be opened up during the coming summer. According to the report, a total of 6500 acres will be available during the next few months.

Lewistown—Robert Nahm is sinking a new coal shaft south of the Evans hill in East Lewistown. It is believed that this mine will be operated electrically, and that due to a favorable location it will be a financial success.

IOWA

Albia—The governor recently reappointed the following inspectors for four years beginning July 4, 1915: W. E. Holland, of Albia, first district; R. T. Rhys, Ottumwa, second district, and Edward Sweeney, of Des Moines, in the third district. At the session of the legislature just closed, a bill was passed changing the time of the biennial report from the fiscal year, June 30, to the calendar year, Dec. 31. The next report will be made for 18 months, ending Dec. 31, 1915, after which these reports will be made every two years.

COLORADO

Pueblo—The mine of the Colorado Central Coal & Mining Co., on which $300,000 in bonds is outstanding, was recently sold at auction for $15,000. The property was bid in by John H. Voorhees who represented the bondholders. The state mine inspector has refused to permit the mine to be opened until extensive repairs can be made. The company will be reorganized and funds raised to proceed with the operation.

Denver—An increase of 100,000 tons over the coal production of the state in February is shown by the March report of the state coal mine inspector's office. The total production of Colorado's coal mines for the period Jan. 1 to Apr. 1 of this year is given at 1,967,986 tons, or a decrease of 24,468 tons on the production of the corresponding period in 1914. The European war is held largely responsible for the drop in production. The March production was 678,868 tons with 11,735 men employed, while 10,580 men were employed in March, 1914. Six men were killed in the mines of the state during March.

MONTANA

Great Falls—Fire of an unknown origin recently destroyed most of the main buildings at the entrance of the coal mine of the Anaconda Copper Co., at Belt. Among these buildings were the tipple, store house, blacksmith shop, stable, and boiler house. The power house, fan house, carpenter shop and washhouse, were saved, but sustained damage. For the past two years this mine has been operated under lease by the D. W. Merkle Coal Co.

Laurel—The International Coal Co. in the Billings district is commencing the development of a new vein which promises to be one of the richest in Montana. President Talmage states that development will be rushed as fast as possible, and further announces that the coal being taken out shows as high a test as the best grades from West Virginia.

PERSONALS

M. A. Burriss, formerly connected with the Bunsen Coal Co., at Danville, Ill., has been transferred to the H. C. Frick Coke Co., with headquarters at Connellsville, Penn.

D. W. McClennan, traveling salesman for the Pittsburgh Coal Co., has been appointed sales manager of the Allegheny Coal Co., with office at Buffalo, to fill the vacancy caused by the resignation of B. W. Wistar.

James Wardlow, Sr., the mining teacher who conducted such a successful class for miners in Mt. Pleasant, Penn., last season, has reorganized his class. The class last season had 33 members, and it looks as if this year's will be much larger. Mr. Wardlow is doing a good work in this line.

A. P. Houston, of Ensley, Ala., has just received a patent on a novel type of conveyor for the joint purpose of conveying and screening coal, iron ore and like materials and to effect movement and screening of the material without excessive vibration common to present screens.

E. C. Lambert, mine inspector of the 12th District of West Virginia, has resigned. Mr. Lambert has been offered a position as superintendent of the Excelsior Pocahontas Coal Co. P. P. Kerr, assistant superintendent of the Thacker Fuel Co. of New Thacker, has been appointed successor to Mr. Lambert.

William E. Trautmann, of East St. Louis, Ill., has been named receiver for the Carterville Coal Co. This action was taken in the Federal Court, at Danville, Ill., by Judge S. M. Wright. To operate the plant involved, it will be necessary to obtain money for immediate use, either by making a loan or by issuing receiver's certificates.

W. B. Beals, who has been connected with the West Virginia-Pocahontas Coal Co. at Leckie, W. Va., for the past six years in the capacity of superintendent, has been promoted to manager of the Leckie Collieries Co., of Leckieville. William Smith, foreman of the West Virginia-Pocahontas plant, has been promoted to succeed Mr. Beals.

P. J. Rogers, for many years superintendent of the Pratt Coal Mine Division of the Tennessee Coal, Iron & R.R. Co., during most of which time convicts have been worked in some of the mines, is an applicant with strong supporters for the presidency of the State Convict Bureau. Mr. Rogers is regarded as being one of the best posted men in the state of Alabama on convict labor.

OBITUARY

Guy M. Dean, secretary of the Ohio & New River Coal Co., died in a hospital recently from the effect of a self inflicted bullet wound. Mr. Dean was a native of Owensboro, Ky., and was interested in coal operations in West Virginia and the West.

John E. Curran, 65 years old, state mine inspector of the 18th district of Pennsylvania, died in Pottsville May 1. He held the position of inspector since 1902, previous to which he was a mine foreman, having been the official head of several of the leading collieries in the vicinity of Pottsville. He started his career as a slate picker.

George W. Eliason, aged 52 years, a mine superintendent in the employ of the Byron Coal Co., died at Clarksburg, W. Va., recently from cancer. Mr. Eliason was one of the best known mine superintendents in this section of the country, having worked for a number of years for the Consolidation Coal Co., and later for the Byron Coal Co. He is survived by two sons, three daughters, two brothers and a sister.

William Johnson Eicher, 50 years old, well known in the Connellsville coke region, recently shot and killed himself, the body being discovered by Mrs. Eicher on her return from church. Mr. Eicher was an inventor and had filled numerous positions in and around the mines in the Connellsville region. Two years ago he was forced to give up the superintendency of the mines at Smithton on account of ill health. He is survived by a widow and four children.

Fred Ellwanger, sole survivor of the Marianna mine disaster of Nov. 28, 1908, died on Apr. 26 at the Washington Hospital, following several months' illness of diabetes. The deceased was aged about 46 years, and was born in Germany. Since his awful experience in the mine disaster six years ago he has not been the same man he was prior to that time. When Mr. Ellwanger was taken from the mine, more dead than alive, 42 pieces of slate and coal were extracted from his left side, where they had been blown by the explosion. His hair was burned off and a portion of one ear. The explosion occurred about 11 o'clock in the morning and it was late in the evening when he was rescued.

INDUSTRIAL NEWS

Denver, Colo.—The Denver branch office of the Sullivan Machinery Co. has been removed to Room 837, Equitable Bldg., instead of 1748 Broadway, as heretofore.

Columbus, Ohio—The offices of the Central West Coal Co. have been moved from the Columbus Savings & Trust Building to the 12th floor of the Brunson Building.

New York, N. Y.—The New York branch office of the Jeffrey Mfg. Co. has been removed from 77 Warren St., to 50 Dey St. George H. Mueller, assistant sales manager of the Jeffrey Mfg. Co., is manager of this office.

Youngstown, Ohio—Contracts totaling three million dollars for the construction of 200 by-product coke ovens at Struthers, were awarded Apr. 29 by the Youngstown Sheet & Tube Co. This firm plans extensions to cost five million dollars.

Philadelphia, Penn.—The Link-Belt Co. of Philadelphia has just received an order from the Maryland Coal Co. of Pennsylvania, St. Michaels' Penn., which is allied with the Berwind-White Coal Mining Co., for two 150-ft. centers, longwall coal conveyors.

Lewisburg, W. Va.—What is believed to be the last of the criminal prosecutions growing out of the Paint Creek coal strike was disposed of recently when L. F. Michael, a mine guard, was discharged because the state failed to presecute a charge of murder against him.

Columbus, Ohio—No bids were received for the property of the Starr-Hocking Coal Co. when it was offered for sale at public auction at the Franklin County Court House recently. The property was offered by Receiver C. E. Haskins. Authority has been secured from the court for another sale May 8.

Birmingham, Ala.—A temporary injunction was recently granted by Judge E. C. Crow of the Circuit Court to restrain T. B. Bowers, tax collector of Jefferson County, from attempting to enforce the payment by the Pratt Consolidated Coal Co. of the tax on solvent credits. It is alleged that this tax is illegal.

Havana, Ill.—J. M. Atwater is building one of the largest barges ever constructed in Havana. This boat is to be 26x60 ft., and can carry several carloads of coal or other tonnage. The side planks are of Oregon fir, 4 in. by 54 in. by 60 ft. These were shipped from Everett, Wash., on two special flat cars. This barge will be launched within a few weeks.

Fayetteville, W. Va.—The Spruce River Coal Co. operating a mine at Ramage on Little Coal River is now driving another mine on Horse Creek about 30 miles therefrom. This will be ready for operation the latter part of June. Other coal companies in the Coal River field are prospecting new mines, while others are seeking locations for expansion of their mining interests.

New Orleans, La.—A coal tipple, the only one in the New Orleans section, has been constructed at Port Chalmette, St. Bernard Parish, by the New Orleans Co. A recent test of the improvement proved it to be satisfactory in every respect. The tipple will make it possible to transfer coal from cars to barges at a greatly reduced cost. The chute is located on the lower side of Chalmette.

Trenton, N. J.—The Lehigh Coal & Navigation Co. was recently indicted in the United States Court on charges that in violation of the Interstate Commerce Act it accepted from the Central R.R. of New Jersey rebates on coal shipped from Hauto and Nesquehoning, Penn. There are thirty counts in the indictment and the defendent may be fined $20,000 on each count of which he is found guilty.

Birmingham, Ala.—It was recently announced that the steel construction for the benzol plant to be erected by the Tennessee Coal, Iron & R.R. Co. has been given to the American Bridge Co. This contract calls for several hundred tons of steel which will be made as rapidly as possible. There is a general impression that the plant will be ready for operation Sept. 1 next, and efforts in that direction will be made.

Lima, Ohio—For the first time in two years the local shops of the Cincinnati, Hamilton & Dayton R.R. Co., employing 400 men, have run on full time for an entire month, and prospects are that they will continue to do so for several months longer, as there is a large amount of equipment requiring repairs. Activity in the shops is reported to be the direct outcome of largely increased business for the road, the coal traffic to the Lakes being an important factor.

Pittsburgh, Penn—A total decrease of 1,570,893 tons of coal and coke took place in the tonnage hauled by the Pennsylvania R.R. on the lines east of Pittsburgh and Erie in March. Decreases in coke and both kinds of coal are shown for the month, as well as for the entire year thus far. The greatest falling off as compared with March, 1914, was that of bituminous coal. A total of 3,243,270 tons were hauled this year, being a decrease of 1,170,645 tons.

Washington, D. C.—The Interstate Commerce Commission recently entered a decision upon a rehearing of the petition of the Campbells Creek Coal Co., of West Virginia, holding that through rates and joint rates should be established for the transportation of coal from points on the line of the Campbells Creek R.R. to the interstate destinations mentioned in Kanawha & Michigan Ry. tariffs, and such joint rates should not exceed the main line or district rates now applied from points on the line to the Coal & Coke and the Kanawha & West Virginia railroads to the same destinations.

Baltimore, Md.—Approximately 197,794 tons of coal were exported from this port during the month of April. This exceeds the shipment during the banner month of September, 1914, when 128,761 tons were exported. Forty steamers and four schooners cleared this port foreign during the month of April. The value of the coal carried will probably reach $500,000. The exports were apportioned to the following countries in the quantities named: Italy 98,135 tons, Argentina, 55,997; Cuba, 15,401; Egypt, 8270; France, 7572; Costa Rica, 3528; Panama, 3145; Jamaica, 905; Venezuela, 950; Bahama, 80 tons.

Coal Trade Reviews

General Review

Anthracite buyers less responsive as the season advances and some accumulations are noted. Heavy increase in export shipments creates a better tone in the Eastern bituminous market. Situation at interior points continues dull and discouraging. Pessimistic outlook in the Lake trade.

The general tone of the anthracite market continues satisfactory and a large tonnage is moving, but it is nevertheless a fact that the trade is notably lacking in the usual rush that marks the opening period. There are instances where wholesalers are being hard pushed temporarily to place coal, while reports of concessions on the regular circular are noted on certain sizes. Dealers are cautious about accumulating excessive stocks and the trade is generally in a less receptive condition than at the opening period. Lake shipping is getting under way but the movement is light.

The heavy export shipments of bituminous have created a distinctly better feeling in the Eastern market. Operators are apparently so confident of a tremendous demand in this direction that they are notably less responsive to offers at the prevailing low prices and there is an optimistic trend to the situation though without any actual development of a constructive nature yet. The Atlantic Coast terminals are crowded with train loads of coal and with foreign transports.

The outlook for the late fall is much improved though consumers who have not yet covered their requirements continue buying in the open market as a rule; on the other hand it is probable they are already facing higher contract prices than could have been done the last two or three weeks. In fact were there any life to the prompt market at the moment the activity in export business would be sufficient to create a general upturn throughout the trade.

While a few agencies in the Pittsburgh district express very positive views of an improvement, it is clear that the exceedingly light shipments in the Lake trade continue to exert a very depressing influence. Operations are still heavily curtailed, in spite of which there is considerable coal on demurrage and the very cautious buyers are still relying on cheap fuel of this kind. The tonnage now moving in the Lake trade is practically negligible and there are scarcely any inquiries for the future.

The Ohio trade is still marking time pending further developments. It is reported that interior movement from the Upper Lake docks is congested, which will no doubt tend to delay any improvement at this end. The steam demand fails to show any improvement and the buyers are confining their purchases generally to the open market.

The Middle Western mining operations are restricted to an abnormally low basis, while the trade is distinctly dull and shows no indications of any change in either direction. Mine operations have been reduced to the minimum summer schedule, a great number having closed down entirely for repairs. The most encouraging factor in the current situation is a well defined tendency in all directions to maintain prices. The scarcity of screenings still prevails and this is the only grade in any active demand at all.

BUSINESS OPINIONS

Sentiment continues highly optimistic, but there are still restraining influences and unfavorable factors to be overcome.

Financial Chronicle—Definite or tangible evidence of benefits from war orders is as yet entirely lacking. In the meantime, unpleasant reminders are all the time coming to hand, making it plain that before the war orders appeared as a factor in affairs many properties were doing very poorly indeed and had uncommonly unsatisfactory income statements.

Boston News Bureau—The average business man as well as the industrial leader is convinced that business is well on the upgrade and that the second half-year will prove even more encouraging than the past quarter. Certainly the prospects of nearly all industries are uniformly brighter than at any time since 1909. New England, afflicted with tariff and railroad troubles, and for a long time a sore spot on the industrial body, is operating its cotton mills at 85% to 90% capacity, its woolen mills overtime and its machine tool factories at greater capacity than for many years.

Dun's—Each week strengthens confidence in a progressive revival of business activity, but the forward movement is, in many departments of trade, so slow, and there are so many cross influences at work, that some disappointment is felt that the advance is, on the whole, not more pronounced. That substantial progress is being made is clearly disclosed by the trade statistics and reports. Bank clearings are beginning to reveal small gains over last year, and while this favorable showing is a reflection largely of the effect of the recent speculative expansion upon the New York clearings, it is nevertheless an indication of the trend of business.

Bradstreet's—Business continues to gain in vitality, the rate of improvement being of the gradual but steadily spreading type, with trades and sections heretofore backward falling in line. Distributive trade, benefited by summer-like weather, has expanded; current shipments by jobbers of essential staples are quite satisfactory; confidence in the future, expressed at numerous points, is manifested in a strong disposition to place conservative orders for future delivery.

Iron and Steel—Pig iron buying has been light and no large transactions are recorded for finished products. The inquiry of the Pennsylvania R.R. for a large amount of equipment has not progressed any further than the tentative stages, and it seems as though this was more or less of a feeler. At the same time, it cannot be said that the market has moved backward, as operations of the leading interests are about at 70% normal. It has been denied, from authoritative quarters, that the United States Steel Corporation has any war orders and it is not believed that it will take any.

Engineering News—Every indication points to a period of prosperity for this country, the like of which has never been seen. Increased business is slowly being built on the foundation of unusual returns to agricultural interests. The self-denial of the last few months, following a period of personal retrenchment over a number of years, has resulted in the accumulation of a vast fund which is now awaiting investment. A large part of the increased business is due to the unbounded confidence of men of large affairs who are willing to risk their time and capital in new enterprises. The Construction News Department last week published more items of new construction than ever before in the history of the paper.

ATLANTIC SEABOARD

BOSTON

F.o.b. situation improved but New England trade still slack. Buyers as a rule not yet attracted but some sales are reported. Georges Creek bottoms loading Pocahontas and New River coal. Pennsylvania interests following the Eastern market closely. April prices being carried over on May shipments of anthracite in some quarters.

Bituminous—While there is no change in the demand for coal in New England, it is plain that price conditions at Hampton Roads are somewhat improved. There is enough faith in the export trade to make shippers less responsive to low offers, and minimum prices are up at least 5c. from a week ago. Manufacturing interests report a slight improvement also and it is possible we shall have much better fall conditions than have been looked for hitherto. A few new contracts have been closed lately but nothing over 25,000 tons is reported. Such tonnages are almost invariably placed with the shippers who had them last year. The consumers who did not contract early are for the most part keeping out of the market.

It is conceded there is a more optimistic feeling in the trade. The fact that Baltimore shippers have been obliged to put some of their coastwise transportation in for Hampton Roads loading is looked upon as significant. It not only increases New England clearances from Hampton Roads, but indicates at least the possibility, of diminished shipments here from Baltimore. Since a large tonnage has always come to this territory from the upper Chesapeake, the Hampton Roads agencies are naturally hopeful over the outlook.

The continued steamer congestion at Baltimore has the effect here of very much curtailing receipts of Georges Creek. If there were more life to the local market such a condition would have an effect on prices. As it is, stocks everywhere being so large, a cessation of shipments for a week or ten days would be hardly noticed.

The trade in the Pennsylvania grades continues without much change. A better movement is noticed from New York to Providence, and it is likely that 40c. freights are helping cut Cambria and Somerset coals in competition with Pocahontas and New River. The export demand for Georges Creek is tending also to increase the outlet for the more popular coals from Pennsylvania. From Philadelphia there has been a slight increase in shipments of these grades and factors there are likely to make a determined effort to place coal in new directions as the season advances.

Water Freights are still easy, the supply of barges and steamers being ample to meet current demands. There is more of a disposition now on the part of owners to make charters through the season, a few such arrangements having been put through within a week. Single trip rates remain at 75@80c., depending on the class of tonnage.

Anthracite—Many of the shippers are not only carrying over a fair supply of May orders but apparently deliveries on the April schedule are being extended. There is no snap to the trade and every wholesaler is pushing hard to place coal. Once the dealers take on what their storage will accommodate it will be several months before the market develops anything more than a hand-to-mouth demand.

Current quotations on bituminous are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.85@1.40	$1.15@1.60	$1.67@1.77	
Philadelphia*	2.10@2.65	2.40@2.85	2.92@3.02	
New York*	2.40@2.95	2.70@3.15	3.22@3.32	
Baltimore*			2.85@2.95	
Hampton Roads*				$2.70@2.80
Boston†				3.50@3.73
Providence†				3.53@3.73

* F.o.b. †On cars.

NEW YORK

More optimistic feeling in bituminous. Operators less aggressive over new business. Satisfactory situation in anthracite. Steam coals showing a tendency to drag.

Bituminous—The soft-coal market is in a healthier condition than a week ago. A stronger feeling of optimism prevails and the prospects for a rejuvenated market become more evident daily. There is plenty of coal on hand to meet any immediate demand. The low point in the bituminous market has apparently been reached and a steady progress is now anticipated. It will, however, be several weeks and perhaps months before operators will feel that conditions are what they should be.

Many large consumers who are not tied up to contracts are buying in the open market, claiming they are able to supply their wants cheaper. Very few contract inquiries are being received by the shippers. With the market becoming stronger, large consumers are likely to close contracts shortly, and in some cases it is probable they will pay more for their coal than they would have a few weeks ago. This is especially true of the higher grades. Operators are not as a rule pushing for new contracts. Some say they will not accept any new business for the coming fall and winter at the low prices that have prevailed.

Production is not being rushed, the mines working from three to four days a week and a few a trifle better. The export business is looking upward. Shipments to New England are increasing.

Local quotations on various grades are as follows:

	South Amboy	Port Reading	St. George	Upper Ports	Mine Price
Georges Creek	$3.00@3.10	$3.00@3.10	$3.00@3.10		$1.50@1.70
South Fork	2.90@3.05				1.35@1.50
Clearfield:					
Best	2.70@2.85	2.65@2.80			1.40
Medium	2.55@2.70	2.50@2.65		$2.75@2.80	1.15@1.25
Ordinary	2.45@2.55	2.40@2.50		2.60@2.70	1.00@1.10
Broad Top Mt.					1.15@1.50
Cambria County	2.75@2.90	2.75@2.90			1.15@1.40
Quemahoning		2.70@2.85	2.70@2.85		1.20@1.30
Latrobe	2.40@2.50				0.90@1.00
Greensburg	2.50@2.60				0.90@1.00
Westmoreland	2.75@3.00				1.15@1.25
West Virginia:					
Mine-run		2.30@2.55	2.30@2.55		0.90@1.00
Three-quarter		2.50@2.90	2.50@2.90		1.00@1.10
Western Md.		2.20@2.40	2.20@2.40		0.80@0.90

Anthracite—There is little to complain of in the hard-coal situation. The mines are working nearly full time; shippers are kept busy and the retail dealers are being pushed to fill all their orders. Prospects for a good summer are encouraging, although it is not expected the present pace will be maintained.

Reports from Canada and the West tell of good business and shipments on the Great Lakes are increasing. While the official tonnage figures for April are not now available it is evident from advance reports that there was a big increase in production. April business was good and the current month has opened up fair. But notwithstanding this better business some cutting of prices is being done, principally by individuals, some reports going so far as to say that shipments are being made on less than April prices.

Demand for the prepared sizes is about evenly divided. The steam coal situation remains practically unchanged. Pea coal continues in light demand with concessions being made to move tonnage. Some grades were quoted early in the week at $3. Buckwheat coals are moving slowly with little call for the poorer grades though the better qualities are finding a fair market. There is not an over-supply of the steam coals at the loading docks at present but they are beginning to accumulate.

Heavier shipments to Sound points are reported, as well as to points along the New England coast.

The anthracite market is now quotable on the following basis:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$4.65	$4.65	$4.70	$4.70
Egg	4.90	4.80@4.90	4.95	4.85@4.95
Stove	4.90	4.80@4.90	4.95	4.85@4.95
Chestnut	5.15	4.80@5.15	5.20	4.85@5.20
Pea	3.35@3.50	3.05@3.30	3.40	3.00@3.15
Buckwheat	2.50@2.75	2.40@2.55	2.55@2.80	2.30@2.60
Rice	2.00@2.25	2.00@2.10	2.05@2.30	2.05@2.15
Barley	1.75@2.00	1.50@1.90	1.80@2.05	1.65@1.90

PHILADELPHIA

Anthracite outlook less encouraging for May. Retail trade dull and many dealers have full stocks. Bituminous shows no indication of improvement, either in demand or prices.

Anthracite—The beginning of the month of May does not find the anthracite trade in the receptive condition that characterized it at the beginning of April. The retail trade has fallen off, and dealers are inclined to be chary about putting on additional supplies until they get rid of some of the coal they have in storage. Collections have been poor, and dealers are going slow in the matter of placing coal where they are not sure of a prompt return.

The present indications point to a dull summer, and both the wholesale and retail trade are likely to find rather hard sledding for the next three or four months. It is understood that quite a number of orders were carried over from April, and it is intimated that many of these will be filled at the April prices.

Broken size continues in good demand, mostly on contracts. Egg and stove are also holding strong, although the former size can probably be bought at less than the circular. Chestnut is developing weakness, and the inducement of stove prices is probably responsible for the moving of more than a little of this grade. All the small sizes are on the retired list for the spring and summer, and it is understood that on full mining, a large percentage of these grades will go into stock.

Tidewater prices as follows:

	Circular	Individuals
Broken	$4.35	$4.25
Egg	4.60	4.50@4.60
Stove	4.60	4.60
Chestnut	4.85	4.60@4.70

BALTIMORE

The record export movement the feature of the trade. Indications are that May will see the 200,000-ton mark passed. Domestic situation quiet and prices remain soft.

With a total of 193,293 tons of export coal recorded for the month of April, coal shippers here are looking forward to a still greater increase for the current month. All tidewater shipping terminals here are crowded with loaded coal cars and vessels, and it is expected that more than 200,000 tons will be shipped foreign from Baltimore during May. Last week more than 46,000 tons went out and there is every prospect that more than 50,000 tons will move each week of the present month.

The local situation is not favorable. While a good many of the best coals of West Virginia, Pennsylvania and Maryland are now under contract, the demand is rather slow and the spot market is still heavy.

West Virginia gas three-quarter has sold in some instances at 85@90c., but in other cases has been refused at less than $1. Slack is strong at 75c. Steam lump sells around 95c., and mine-run fuels at 80 to 85c. Best West Virginia coals sell at from $1.15 to $1.50. Pennsylvania low grade coals are offering at from 90c. to $1. High grade fuels are selling at the mines to the trade at $1.25 to $1.35. Some specialized coals of western Maryland and Pennsylvania have sold up to $1.60, but these are largely out of the open market.

HAMPTON ROADS

Movement for week shows up well. Export shipments particularly heavy. Dumpings for month of April, 1,192,020 tons.

The movement of coal in the foreign trade still continues large, the Italian ports alone having taken approximately 60,000 tons in the past week. The largest single cargo amounted to 9750 tons and went to Messina which port alone took about one-third of the coal going to Italy. The coastwise movement has been heaviest to Boston, Providence, Portland and other New England ports although some cargoes have been shipped south as far as Jacksonville, Fla. In addition to foreign and coastwise shipments considerable coal has been taken by the government for use of the Atlantic fleet.

While all of the export shipments have been Pocahontas or New River run-of-mine, some of the coal going coastwise has been nut and slack and high volatile. The demand for nut and slack appears to have improved somewhat but little inquiry is being made at present for the latter. Prices on the various grades of coal are holding up well and so far as can be learned the circular is well maintained.

During the month of April 1,192,020 tons of coal were shipped from Hampton Roads which compares with 1,063,719 tons for the same month last year. Of this quantity the Norfolk & Western moved 627,438 tons, the Chesapeake & Ohio Ry. 313,327 tons and the Virginian Ry. 251,255 tons. Both the Norfolk & Western and the Chesapeake & Ohio show a decided gain over their dumpings for the same month, last year while the figures of the Virginian Ry. are slightly less.

The following vessels sailed from Hampton Roads with cargoes of coal during the week Apr. 23 to 30, inclusive:

Norfolk	Destination	Tons
Laertis	Montevideo	5332*
Hermod	St. Thomas	4575
Albania	Brindisi	3164
Rosalia L.	Messina	9750
Aghios Gerasimos	Naples	4688
Finn	Canal Zone	6000
Antares	Vera Cruz	2700
Chiswick	Canal Zone	4800
Balgray	Genoa	5550
T. W. Dunn	Pernambuco	806
Van A. Broughton	Buenos Aires	3176
Ruth	Buenos Aires	4200
Grigorios	Civita	
Anghelatos	Vechnia	5573
Anna	Kingston	2000
H. G. Foss	Maranhan	1231
Heina	RiodeJaneiro	3949
Jas. T. Maxwell	Maranhan	840
Venus	Genoa	5629
Watermouth	Montevideo	5928
Anglo Parodi	Messina	5191
Frankrig	Barbados	2220
Italia	Messina	4327
Circe	Spezia	3875
N. M. Porcello	Bermuda	841
Benedict	Para	1250
Carlo	Cagliari	7139
Sallie C. Marvil	Pernambuco	1113
Newport News		
Corvovodo	RiodeJaneiro	3600
Knud II	Chaparra	3000
Edison Light	Havana	3868
Toiropinos	Naples	4500

*Also 200 tons of coke.

Note—Steamers are indicated by **bold face** type, all others being schooners.

Virginian Ry. dumpings for the week ended May 1 were 65,099 tons.

Dumpings of the N. & W. Ry. for the period Apr. 25 to 30 inclusive were 138,105 tons. The total dumpings for April amounted to 627,438 tons.

OCEAN FREIGHTS

Rapid increase in export shipping. Rates generally steady at former levels.

For some time past we have chartered one or two steamers per day for export coal. There is no question but that America's export coal trade is increasing very materially, and it is hoped that a large portion of this increase will be permanent. A number of coal companies here are endeavoring to develop their export business through London agents, and they may be able to sell a few cargoes in this way, but it is apparent that colliery owners here should work direct with consumers at the other end. The freight market is "marking time" to various destinations, but to South American ports the rates are easier (owing to the advancing rates on grain from the Plate) while to the Mediterranean quotations are a trifle firmer. Among the recent charters for export coal were two steamers from Virginia to Rio at $9.36; a steamer to Santos at $9.60; a steamer to Valencia, Spain, at $10.80; two steamers for West Coast of Italy at $10.80; two steamers for coke to Valparaiso or Callao; and a number of steamers for coal to Lower Plate ports at or about $9.12.

Ocean freights are now quotable on the following basis:

To	Rate	To	Rate
Havana	$2.25@2.50	Demerara	$5.50@6.00
Cardenas or Sagua	3.25@3.50	Bermuda	3.50@3.75
Cienfuegos	3.25@3.50	Vera Cruz	**3.50**
Port au Spain, Trinidad	3.75@4.00	Tampico	**3.50**
St. Lucia	3.50@3.75	Rio	**9.36**
St. Thomas	**3.25**	Montevideo	**9.06**
Barbados	3.75@4.00	Buenos Aires or La Plata	**9.12**
Kingston	3.00@3.25	Mediterranean*	**10.80**
Curacao	3.75@4.00	Spain**	9.60@10.44
Santiago	3.25@3.50	Valparaiso†	**6.72**
Guantanamo	3.25@3.50	Marseilles	9.60@10.44

Note—Rates noted in **bold face** type are only approximate.

* To a direct port not east of the West coast of Italy, Spain excluded.

† With 800 tons per day discharge.

W. W. Battie & Co.'s Coal Trade Freight Report.

**Spanish dues for account.

OCEAN CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Colusa		Atlantic Range	Tiburon	3622	$6.50
Colusa		Atlantic Range	San Diego	5000 to 7500	7.00
Bonvilston	British	Philadelphia	River Plate	1815	9.36
Mathilde	Norwegian	Baltimore	Havana	1346	
Florence M. Belding		Philadelphia	Cienfuegos	493	
Eagle Wing		New York	Charleston	1076	
Wm. Booth		Philadelphia	Wiscasset	435	1.00
Samuel P. Bowers		Norfolk	San Juan, P.R.	526	
Maasdijk	Dutch	Atlantic Range	Rio Janeiro	2935	9.36
Bendew	British	Virginia	Valencia	2305	10.08
	Foreign	Baltimore	Virginia	6000	10.32
	Foreign	Virginia	Montevideo	5500	8.88
Ella M. Willey		Norfolk	Rio Janeiro	735	7.50
Fanny C. Bowen		Philadelphia	Mayport	892	0.95
Sophie H.	Dutch	Norfolk	River Plate	1864	9.36
Henrik Ibsen	Norwegian	Atlantic Range	Barcelona	2960	
Heighington	British	Atlantic Range	Barcelona	1827	9.12
Eliofilo	Italian	Philadelphia	Messina	2395	
Itasca		Philadelphia	New Orleans	989	
Alicia B. Crosby		Norfolk	Brazil	1016	
George E. Walcott		Norfolk	Para	1388	
Evelyn W. Hinkly		Norfolk	Azores	558	
J. Frank Seavey		Philadelphia	Summerside, P.E.I.	336	$1.85
Evanger	Norwegian	Baltimore	Nipe Bay	1326	
New Orleans		Philadelphia	New Orleans	1017	
Primus (bark)	Norwegian	Norfolk	Buenos Ayres	1019	
Dagny (bark)	Norwegian	Norfolk	Rio Janeiro	1034	
Ferm (bark)	Norwegian	Norfolk	Pernambuco	1898	

Note—Steamers are indicated by **bold face type**, all others being schooners.

LAKE MARKETS

PITTSBURGH

Mine operations continue at about 50%, with hardly any contracting. Both contract and free coal are at low prices. Poor outlook in Lake trade.

The coal trade of the Pittsburgh district has experienced little if any improvement since last report. A little Lake coal is now moving but the movement is very small indeed for the beginning of May, and there is little prospect of anything like a normal business before the beginning of July. Scarcely any merchant coal is moving to the Lake trade, or is even being inquired about, the shipments being almost entirely by regular shippers who have their own sources of supply. From the present outlook it is possible that the whole season will pass without much coal being bought for Lake shipment.

Demand from manufacturers has shown no increase in the past week, and in some quarters there is even reported a slight decrease. The domestic demand is very small. Operations in the Pittsburgh district continue at about 50% of capacity, some mines operating at less than this rate and others being closed, while a few are working at close to capacity.

Prices continue as irregular as ever. There can scarcely be said to be a contract market, though $1.15 for mine-run is usually named as the objective point. This same figure, however, represents about what has been done in occasional transactions for ¾-in. Lake coal. For prompt lots last week's quotations are repeated, the figures being subject to shading upon occasion as formerly: Slack, 75@80c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1@1.05; ¾-in., $1.10@1.15; 1¼-in., $1.20@1.25, per net ton at mine, Pittsburgh district.

BUFFALO

Bituminous still quiet, but doing a little better, according to jobbers. Operators not so hopeful. Anthracite about normal.

Bituminous—The more sanguine members of the jobbing trade are positive that the demand is better than it was and though they admit that prices are about 10c. lower than a year ago, they are somewhat better than during the past month. The Canadian trade is about as dull as ever, and this injures Buffalo more than any other market could. Quite a good many shippers here depend on that trade very largely. As a rule the Canadians take the view that their factories will soon get war orders enough to keep them running. There is said to be a large amount of bituminous coal on car service; it does not appear to be in excess here, though there is always some. City jobbers are receiving letters from mine owners urging them to take coal which cannot be placed elsewhere. The general opinion is that there will be a slow increase in activity for a month or two and then something better. One difficulty is that not a few wise consumers are depending exclusively on demurrage coal and refuse to consider a purchase till it is offered to them below the regular market. No real improvement is possible under such conditions.

There is not enough new strength to the bituminous market to make any advance in prices likely right away. Quotations continue at: $2.70 for Pittsburgh lump, $2.55 for three-quarter, $2.45 for mine-run and $2.25 for slack, with $2.50 for smokeless.

Anthracite—The trade is quiet, but there is no complaint, as sales are never heavy at this time of the year. Some of the shipping agents state that there is a shortage of coal and there is apparently a better demand for it eastward than there is to the west. Lake shipments are rather light, being 99,000 tons for the week. Some of the companies report that they are merely taking care of their small customers at the minor Lake ports, as they still have a sufficient supply at the larger centers. Locally there is some price cutting in anthracite.

TOLEDO

Some movement of Lake coal but it is still light. Prices unchanged but weak.

There are some boats loading here but not much Lake coal is yet moving nor is it expected that there will be any really heavy shipping until June or July, because of the heavy stocks at the upper docks. The unsettled condition at the Ohio mines is also affecting the situation and very little hope is expressed here of an early settlement of the labor difficulties. The domestic trade has fallen off considerably and steam coal is not moving very freely. It is still early for the summer contracts on anthracite coal although it is expected that there will be the usual demand for summer delivery within the next two or three weeks. Prices are not holding very close to the list.

COLUMBUS

Dullness still characterizes the coal trade in Ohio. Some little activity is shown in Lake business. Steam market is dull.

Some slight stir is noted in the Lake trade but the season is slow in opening. Coal men generally are still playing a waiting game, hoping for something to turn up to inject activity in the market.

Retailers are only buying what they must have to piece out the season and consequently their orders are small. Most of the dealers have cleaned up fairly well and this is taken as an indication for good business when the stocking season arrives.

Steam trade is slow in every way. Manufacturing is not increasing to any extent and as a result fuel requirements are not large. A large part of the fuel for steam purposes is being purchased in the open market at the cheap prices which prevail; as a result contracting is a difficult matter at this time. Some railroads are using considerable coal.

Lake trade is showing some activity but it will be July 1 before it is in full blast. Some cargoes have moved from the Lower Lake ports to the Northwest. The docks of the Upper Lake ports are still congested and the interior movement is rather slow. Chartering of boats is now more active. With the opening of the Lake trade there is a softening in the prices for small sizes which is usual for this period.

Production in Ohio fields is still low. In the Hocking Valley the output is estimated at but 25% of normal and the Jackson field reports about the same output. In Massillon, Cambridge and Crooksville the output is not more than 35%. Pomeroy Bend reports about 40% of the average.

Some demand for anthracite is noted and prices are down some from the winter levels.

Prices in the Ohio field are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump..............	$1.45	$1.50	.....
Inch and a quarter............	1.30	1.35	$1.30
Three-quarter inch............	1.25	1.30	1.25
Nut	1.15	1.25	1.15
Mine-run.....................	1.05	1.10	1.05
Nut, pea and slack............	0.70	0.70	0.65
Coarse slack..................	0.60	0.60	0.55

CINCINNATI

Business slow, but agencies continue optimistic. Domestic trade is behind the season. Steam demand better, but prices unsatisfactory. Producing conditions are good.

Both consumers and producers are of the opinion that business is going to improve and the feeling is mildly optimistic. However, the movement remains rather sluggish. Extremely warm weather has virtually cut off the domestic demand for immediate consumption, and the usual spring movement is slow getting under way. There is a large production of screenings and prices are rather unsatisfactory, being 10 or 15c., according to grade, below normal; but the expected improvement in the industrial situation is relied upon to remedy this in the near future.

LOUISVILLE, KY.

Move to prevent price cutting. Slack still short. Some shipments to the Lakes.

The mining companies are doing what they can to prevent price cutting which is reported here and there and groups of operators are holding meetings to try to control this practice. Some Kentucky coal is going to the Lake district, especially from the Big Sandy section and there is no change in the shortage as to steam coals. Prices are quoted at from $1.40 to $1.75 for block, $1.25 for egg and 50 to 70c. for nut and slack in the eastern field; there is no nut and slack on the market in the west, all that produced being absorbed on contracts. Money is free and this is helping stocking operations somewhat.

NEW ORLEANS

Trade quiet. Stock ships for Europe taking large tonnages.

There is no change over recent depressed conditions except on the river front, where trade shows some activity owing to an unusual number of vessels in port, most of them for war cargoes. An abnormal amount of coal is being taken aboard the stock ships, as a sort of ballast. There is no domestic demand. The steam consumption is slightly better.

COKE

CONNELLSVILLE

Better tone sentimentally but quotations unchanged. Production continues at close of 300,000 tons weekly.

The coke market continues to show an improved tone sentimentally, but there has been little activity and prices are not quotably higher though there does not seem to be much coke left at minimum prices. The Pittsburgh Steel Co. is rumored to have contracted with the Rainey interests for about 20,000 tons of coke a month, from July to June at $1.95. As this interest has the contract to June 30 the rumor is generally credited. Prices on coke are on a scale up, according to the period of delivery, and are still quotable as follows: Prompt furnace, $1.55@1.60; contract furnace to June 30, $1.60@1.65; contract furnace to Dec. 31, $1.75; prompt foundry, $2@2.35; contract foundry, $2.20@2.30, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Apr. 24 at 299,493 tons, an increase of 1271 tons, and shipments at 294,995 tons, a decrease of 1349 tons.

Buffalo—There is not much improvement in the local demand, though there are reports of some stir in the Connellsville district. As a rule the trade does not credit the reports, positively as they are made by one or two leading shippers. There is an increase of iron activity here, but nothing significant can be made of it till it has continued for some time. The general feeling is better than it was. Quotations remain on the basis of $4.15 for best 72-hr. Connellsville foundry and $3.15 for stock coke.

Chicago—The market is very quiet for both furnace and foundry sizes with prices steady, but some domestic shipments have been sold at a sacrifice. Prices are as follows: By-product, $4.45@4.65; Connellsville, $4.60@4.75; Wise County, $4.50@4.65; gas coke, $3.75@4; furnace, $4.50@4.65.

MIDDLE WESTERN

GENERAL REVIEW

Market generally apathetic. Screenings in good demand. A uniform effort in all directions to maintain prices.

Dullness still characterizes the coal trade. Only a little tonnage is being absorbed by the country dealers, and contracting is sluggish. Several operators who have taken a good many contracts have stated that they will accept no more tonnage for shipment this season at prevailing prices, and there seems to be a reluctance on the part of some shippers to contract the higher grades at this time.

Mining in Indiana and Illinois is less brisk than for a number of years past. In Indiana and central Illinois a number of operators have closed down additional mines for the summer months, and state emphatically they will not be reopened until there is a better demand for coal.

The quantity of consignment coal now arriving in the Chicago market is negligible, and the few shipments received are sold without creating any disturbance. The general tendency to sustain prices is very noticeable in all grades and sizes of coal and is undoubtedly bearing fruit.

CHICAGO

Steam coals fairly steady but domestic market has practically suspended. Mines closing down. Low price Kentucky fuels a disturbing factor. Anthracite less active than anticipated.

The demand for steam coal from Franklin County mines has been steady. Screenings from this district are strong at favorable prices. Domestic sizes are inactive, but prices are maintained on such shipments as are made. Some Williamson County operators have been crushing lump coal for steam purposes. The demand for Saline County fuel has lessened as compared with other southern Illinois districts.

No change has occurred in the Indiana situation, and the demand is about on a parity with last week. It is said that the output of the Indiana mines for last year will be at least 250,000 tons less than in the year before. The demand for steam coal is better than on any other grade, and production of steam sizes about equals requirements at this time.

Springfield coal is flat. Several important operations are being closed down for the summer months.

Kentucky coals are spiritless, and several shipments have been sold here during the past week at unheard of mine prices in order to move the coal. The eastern Kentucky operators are not at all backward in meeting competition from splint coals, which has a disturbing tendency. Low prices have been made to move unsold splint coal in this market.

The smokeless situation is mixed. Some offerings have been made this week at very low prices, while other shippers are holding strong on future deliveries. No particular improvement has developed in the demand for smokeless coals during the past week. Some Maryland mine-run smokeless has been offered at a price of 70c. per ton at the mines without any takers.

Anthracite was less active during the closing days of the month than was expected, and orders thus far placed for May shipment are short of last year. The country dealers and city yards did comparatively little stocking in April.

ST. LOUIS

Screenings holding fairly active but otherwise the market is heavy. Mine operations much curtailed.

About the only coal moving is a small tonnage for the Terminal R.R. and a few other roads that are buying on the open market. Screenings are holding up fairly well, both Standard and Carterville at about 85c. for the former and 90c. for the latter; these sizes are liable to be still stronger during the next week or so. There is absolutely no domestic demand at all, and such sizes as are moving are going to manufacturing plants at steam prices. The past week has seen a fairly large amount of anthracite moving in. There is also a little smokeless, but the tonnage is extremely light.

The current month will probably show up better than April, but there is nothing to indicate that prices will be any higher. Mines in the Standard field are working about two days a week, and a great many of them have suspended operations indefinitely. In the Williamson-Franklin County field many operations have shut down for repairs, and others are working two and three days a week.

INDIANAPOLIS

Conditions generally unchanged but some mines report an improvement. No betterment in railroad or industrial demand. Screenings sell easily at good prices.

There's nothing in the weather or other influence to make much change in the mining conditions. Operators report that the demand from railroads and factories holds to a steady level. Mining companies are watching closely for signs of material improvement in factory requirements but there is nothing marked in this direction yet. The temperature in Indiana has been ranging from 50 to 90 deg. Screenings continue in good demand at 85c. to 90c., which is an unusually good price. Most of the mines are not averaging much above half time but there are some that report a better schedule the last two weeks than for a long time in the past.

KANSAS CITY, MO.

Market down to a summer basis and no change anticipated until late in the fall.

The wholesale demand has increased slightly due to increased operations of the factories and larger industries, but the prices still remain unchanged. Only a few retail yards have any coal on hand and most of them have gone out of business for the summer. There has been a light business in supplying coal to buildings but this practically amounts to nothing. No change in the price is now looked for until late in the summer months or early in the fall.

PRODUCTION AND TRANSPORTATION STATISTICS

BALTIMORE & OHIO

The following is a statement of coal and coke tonnage moved over this system and affiliated lines during March and the previous two months:

	January		February		March	
	1915	1914	1915	1914	1915	1914
Coal.......	2,293,406	2,917,834	1,906,210	2,385,243	2,094,607	3,173,972
Coke.......	221,395	274,955	232,111	265,380	257,099	356,164
Total....	2,514,801	3,192,789	2,138,321	2,650,623	2,351,706	3,530,136

FOREIGN MARKETS

GREAT BRITAIN

Still considerable uncertainty in the trade and prices high. Labor situation continues serious.

Apr. 23—There are still several very disturbing factors in the coal industry which are acting detrimentally. The threatened labor trouble in South Wales is causing considerable anxiety, while in that and other districts the shipping is difficult. Freights tend to become higher, and with many boats off the market buying is not so regular as it should be. In the Cardiff market this factor is causing a material easing in values of secondary and lower descriptions, while the same cause operates against forward business in the Newcastle market. Particulars of the Norwegian State Ry.'s contract show that about 33,000 tons have been bought, chiefly Newcastle district steams and Derbyshire coal. The price of the Derbyshire coal for shipment at Immingham is $6.48 to $6.60 f.o.b., and of best steam coals $7.44 per ton f.o.b.—"The Iron & Coal Trade Review."

May 5—Cable reports are to the effect that the exportation of coal and coke has been prohibited except to British possessions, protectorates and allied countries. There will be a committee appointed, however, to consider applications for exports to prohibited destinations.

Apr. 23—Market conditions are without improvement and the outlook for the remainder of the month is not vary satisfactory from the exporters' point of view. Tonnage arrivals are low and there are fears of pit stoppages in the near future. Quotations are approximately as follows:

Best Welsh steam.......	Nominal	Best Monmouthshires....	$7.80@8.04
Best seconds...........	Nominal	Seconds................	7.68@7.80
Seconds................	$7.92@8.40	Best Cardiff coals.......	5.16@5.28
Best dry coals..........	8.16@8.64	Cargo smalls...........	4.44@4.56

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Chartering is fairly active and rates show a further advance. Rates are approximately on the following basis:

Gibraltar.....	$4.80	Naples..........	$7.56	Las Palmas......	$5.28
Marseilles.....	8.69	Venice..........	9.60	St. Vincent.......	5.40
Algiers........	5.79	Alexandria.......	7.80	Rio de Janeiro....	7.20
Genoa.........	7.56	Port Said........	7.68	Monte Video.....	6.96
				River Plate......	7.20

Note—These quotations are based on an exchange rate of 24c. to one shilling.

Financial Department

Northern Securities Co.

Pres. Jas. J. Hill reports, in part for the fiscal year ending Dec. 31, 1914, as follows:

There has been no change during the past fiscal year in the investments of the company. The net income is substantially the same as last year, the slight decrease shown being due to the payment last year of the U. S. income tax for 1913. The bills payable have been reduced $20,000 to $120,000 on Dec. 31, 1914. The directors have declared a dividend of 2% on the capital stock, payable on this date.

The regular dividend of 8% per annum has been received from the Chicago, Burlington & Quincy R.R. Co.

The Crow's Nest Pass Coal Co. has paid no dividend during the year upon its capital stock. The officers advise us that its operations during the earlier part of the year were on a satisfactory basis, but subsequently were reduced, owing to the general depression in business. Following the previous policy, the net earnings have been applied to the improvements and betterments and to the continued reduction of its floating debt.

Note—For previous annual report of this company see Vol. 5, p. 390.

⁂

Lehigh & Wilkes-Barre Coal Co.

President Charles F. Huber reports under date of Sept. 24 as follows:

Results—From the surplus for the year, $3,343,478, dividends Nos. 9 and 10 were paid Dec. 22, 1913, and June 23, 1914 ($3.25 per share, or 6½%, each, making 13% for the year), aggregating $1,197,300, and leaving a balance from the year's operations of $2,146,178. Of this last amount there was appropriated for a new breaker, new general shops and supply store $500,000, and for sundry adjustments $42,977, making the balance carried to profit and loss $1,603,200.

Coal—We mined and shipped during the year 5,222,343 tons of coal, an increase of 34,122 tons, and 98,059 tons were purchased, a decrease of 443,499 tons over previous year. The tonnage of prepared sizes sold, including lump, equaled 65.93%, and of pea and smaller 34.07%.

Changes in Property Account—Surface land sold, etc. ($25,879), and depreciation of yards and wharves, marine equipment, colliery improvements and culm banks aggregated $156,720; less coal property purchased, etc., $36,068; net decrease, $120,651.

Sinking Fund for the Consolidated Loan—The amount on deposit was increased by payment June 1, 1914, of $460,000 and by $60,561 interest received from investments. Amount in fund June 1, 1914, $1,947,390, viz.: Invested in interest-bearing bonds, $1,945,974; cash, $1416.

Leases—The payments under coal leases for rentals in excess of coal mined during the current year amounted to $7786, which has been charged to operating expenses.

Improvements—The Buttonwood Colliery, acquired under purchase from the Parrish Coal Co., has been thoroughly rehabilitated and modernized, both as to outside and inside operation. The two collieries, Parrish and Buttonwood, have been connected by a tunnel and the output of Parrish will be handled through the Buttonwood breaker. The track between Inman and Buttonwood collieries has been completed and the output of Inman will also be taken to Buttonwood.

Development and improvement work has been carried on at all collieries to a large extent, so that the operations generally are in position to maintain output at a reasonable cost.

Plans are now under way for the construction of a new breaker and a general rehabilitation of the plant at Wanamie colliery. The present undersized breaker was erected in 1868.

Taxes—Taxes for the year have shown a further increase, and amounted to 20c. per ton of output. The appeals from time to time in the local courts are still pending, and no decision has yet been handed down in a case tried in January, 1913. In the interim, taxes have been paid under protest, in the hope that we may some time reach an equitable and definite basis of valuation on coal lands. In the matter of the so called tonnage tax, levied pursuant to Act of Assembly passed June 27, 1913,, appeals have been filed and no payment will be made until the validity of the Act has been finally passed upon by the courts.

New Business

+No. 640—Fall River, Mass.—The City Government at this place will be in the market on June 1 for about 8000 tons of anthracite and bituminous coal. The current contract was closed at $6.80 per ton for the anthracite, and $4.50 for the bituminous. The call for bids is advertised and the purchase made through local dealers. Address Superintendent of Public Buildings, City Hall, Fall River, Mass.

+No. 641—Detroit, Mich.—The Board of Education at this place will receive bids until noon, May 7, for furnishing coal as follows: Anthracite, 400 tons; 2500 tons of large bituminous; for delivery at 20 different schools; 150 tons of large size semi-bituminous for delivery at one school; 23,000 tons of small size bituminous for delivery at 95 different schools. All the anthracite coal that can be received and stored must be delivered during July and August, and 75% of the bituminous coal must be delivered before Sept. 1. Bidders on the bituminous contract must furnish a certified check for $500 and the successful bidder will be required to furnish a bond for $10,000. Payments will be made on an analysis basis.

Specifications and proposal blanks may be had on application Address Secy. Charles A. Gadd, Board of Education, Detroit, Mich.

+ **No. 642—River Rouge, Mich.**—Sealed proposals will be received until 7 p.m., May 11, for furnishing about one car per week of West Virginia mine-run coal to the City Lighting Plant at this place. Bids should be made f.o.b. on cars at the Municipal Lighting Plant switch. All bids must be accompanied by a certified check for $200. Address Village Clk. Louis Laginess, River Rouge, Mich.

+**No. 643—Lansing, Mich.**—Bids will be received by the state Board of Education, until noon, May, 15, for furnishing approximately 5000 tons of coal, for the normal schools at Ypsilanti, Kalamazoo and Mt. Pleasant. Address Secy. Fred L. Keeler, State Board of Education, Lansing, Mich.

+**No. 644—Fort Hancock, N. J.**—Proposals will be issued about May 15 by the U. S. Army to supply the fuel requirements at this place for the ensuing year. The tonnages involved are as follows: 2000 tons of buckwheat No. 1, 1400 tons of pea, 200 tons of stove, 450 tons of broken and 200 tons of bituminous. Address Commanding Officer, Sandy Hook Proving Ground, Fort Hancock, N. J.

No. 645—Toronto, Can.—The Toronto University buildings here, will receive bids until May 15, for furnishing coal during the fiscal year. Bids are requested on 8000 tons of bituminous and 4000 tons of hard coal, for use in connection with the various buildings and faculties. The contract is usually closed at about $3.35 per ton delivered. Address, Supt. Graham Campbell, Toronto University, Toronto, Ont.

+**No. 646—Atlanta, Ga.**—The City Government at this place will be in the market some time during June for 2750 tons of coal. The current contract was let at $3.60 per ton. The call for bids is usually advertised. Address Pur. Agt. W. E. Chambers, City Hall, Atlanta, Ga.

+**No. 647—Worcester, Mass.**—The County Commissioners of this place will receive bids until 10:30 a.m., May 11, for coal as follows: On cars at Shrewsbury St. siding 600 tons of Georges Creek; in bins at Court House, 300 tons best quality of white ash egg (this order may be filled immediately); on cars at Oakdale, 100 tons of Georges Creek, and 30 tons of best quality white ash stove coal. All bids should be submitted on a gross ton basis. Address County Commissioners, Court House, Worcester, Mass.

No. 648—Toronto, Can.—St. Andrews College in this city is now in the market for a year's supply of coal and tenders will close about the middle of May. The annual consumption amounts to 400 tons of soft smokeless and 100 tons of anthracite, delivery to be made to premises. Address, Supt. C. Bruce Macdonald, St. Andrews College, Toronto, Ont., Can.

No. 649—New Orleans, La.—Bids will be received by the Lighthouse Inspector, New Orleans, La., until 2 p.m., May, 24, for furnishing bituminous coal delivered in vessels of the lighthouse service at Galveston, Tex. Address Lighthouse Inspector, New Orleans, La.

+**No. 650—Pittsburgh, Penn.**—The local Board of Eudcation will be in the market some time during May or June for its annual requirements of coal, aggregating about 14,000 tons. Deliveries are to be made by wagon. The requirements provide for 1¼-in. slack, 1¼-in. lump, mine-run, anthracite and smokeless, and prices on the current contract varied from $1.80 to $6 per ton. The call for bids is advertised. Address Supt. of Supplies C. M. McKee, Fulton Bldg., Pittsburgh, Penn.

No. 651—Toronto, Can.—The Canada Bread Co. expects to be into the market for 800 tons of hard and 600 tons of soft coal about the middle of the current month. The award is made on a competitive basis. Address Gen. Mgr. Canada Bread Co., Toronto, Ont., Can.

No. 652—Waverly, Iowa—The Kelly Canning Co. at this point is in the market for their coal requirements for the ensuing year. They prefer 6-in. lump, or smaller size, clean and free from soot and clinkers and from Southern Illinois mines. They use from two to four cars per month. Address Purchasing Agent, Kelly Canning Co., Waverly, Iowa.

No. 653—Toronto, Can.—The Canadian Pacific Ry. Building will ask for tenders early in the current month for furnishing the coal supply for the ensuing year. Bids will be asked for 3900 odd tons of slack to be delivered according to requirements. Address Building Supt. Canadian Pacific Ry., Toronto, Can.

+**No. 654—White Bear, Minn.**—Sealed proposals were received by the Local School Board until May 3, for furnishing 135 tons of Hocking mine-run coal and 35 tons of anthracite egg to be delivered at school buildings as required. Address Clk. J. A. Milner, Independent School Board, District No. 5, Washington School Bldg., White Bear, Minn.

+**No. 655—Minneapolis, Minn.**—The State Government is in the market for 110,000 tons of coal, delivery to be made at 16 institutions in various parts of the state. Address, State Board of Control, Capitol Building, St. Paul, Minn.

+**No. 656—Murphysboro, Ill.**—Murphysboro Water Works, Electric & Gas Light Co. will be in the market about the middle of the current month for their annual requirements of coal involving approximately 12,000 tons of screenings. Address Supt. W. O. Settle, Murphysboro Water Works, Electric & Gas Light Co., Murphysboro, Ill.

+**No. 657—Nashua, N. H.**—The City Government at this place will contract some time next month for their annual requirements of coal involving about 11,000 tons of broken and stove anthracite. The business is usually closed at about $8 per ton, and the call for bids is advertised. Address the Mayor, Nashua, N. H.

+**No. 658—Sheldon, Iowa**—The City Council will receive bids until 6 p.m., May 10, for furnishing the coal requirements during the ensuing year. Address City Clk. Scott Martin Sheldon, Iowa.

+**No. 659—Philadelphia, Penn.**—The Lighthouse Service at this place will receive sealed proposals until May 10 for furnishing their coal requirements for the fiscal year beginning June 30. Other bidders on this contract were Gregory Coal Co. at $6 and $7; J. A. Black Coal Co., egg and stove, $6.25, nut $6.50, before Sept. 1, with egg and stove at $6.50 and nut at $6.75 and $7.40 thereafter; Wheeler & Howe Coal Co., egg $5.95, stove $6.25, nut $6.75 and $7.40; Sprague Ice & Coal Co., egg, stove and nut $5.55 and $6.40; Berkshire Mills Co., stove $6, nut $6.25 and $7.20. The contract last year was awarded to the Sprague Ice & Coal Co., who were the second lowest bidders this year. Address Board of Contract and Supply, City Hall, Bridgeport, Conn.

Contract Notes

South America—The commercial attachés of the Department of Commerce in South America have cabled the Bureau of Foreign and Domestic Commerce that there is an opportunity for the sale of 380,000 tons of coal at this point. Full details may be had on application.

New Orleans—The New Orleans Coal Co. has just renewed an annual contract to coal the ships of the Southern Pacific Co. in the New York and Havana service. The contract calls for approximately 50,000 tons of Pratt coal per annum.

Buffalo, N. Y.—Spaulding & Spaulding were the low bidders and were awarded the contract for 1300 tons of anthracite for the Buffalo park board. George J. Meyer is Park Commissioner.

Charlotte, N. C.—Coal buying committee of the South Carolina Cotton Manufacturing Association has placed the annual contract with the Clinchfield Fuel Co. of Spartanburg, S. C. The contracts include a year's supply for the majority of the cotton mills of the state and will amount to about 275,000 tons. Largest companies in the bidding were the Virginia Iron & Coke Co., the Stonega Coal Co., Blackwood Coal & Coke Co., Bewley Darst Coal Co., Royal Consolidated Coal Co. and the Clinchfield Fuel Co.

RUN-OF-MINE TALKS

ON YOUR BUSINESS AND OURS

By the Business Manager

IF YOU DOUBT the value of advertising just look at what it has done for the automobile. A well-known economist figured that without advertising it would have taken sixty years to make the automobile as popular as about ten years of advertising did it.

It's the same story with the telephone, especially in rural districts. And if you think of the pleasure and wider outlook these two things the telephone and the automobile have brought to the isolated farm, you'll grant that advertising from a human standpoint is a good thing.

Get the Habit of reading the advertising pages of Coal Age.

A LOT OF MEN are still disputing whether the thousand and one stories told about the Ford Car are good advertising for that car or not. It seems though as if they must be good advertising when you consider how many Ford Cars are in use today.

Frank Tinney, the well-known black-face comedian, has a new Ford story:—

"I was cranking up my Ford," says he, "when it flew off the handle."

Only reliable products can be continuously advertised.

JOHN A. HILL, who is the president of the company which publishes Coal Age gave a lecture the other night before a class in industrial journalism. One of the most important things he said was, "A technical paper that does not teach its readers how to do things in their particular line, *better, cheaper or faster* has no excuse to live."

You could apply that "*better, cheaper or faster*" to every individual advertisement in this paper and you'd find that it stood the test pretty well.

These advertisers pay their good money to tell you certain real facts about their products and they know, as well as you know, that the day of hot air and buncombe has gone to a scrap heap from which, let's hope, it will never return.

Are you profiting by the information the advertising pages offer you?

HERE'S A THIRD STRIKE that the editors of "Cos" put over the home-plate, **"You can't hit the bull's eye with bull."**

COAL AGE

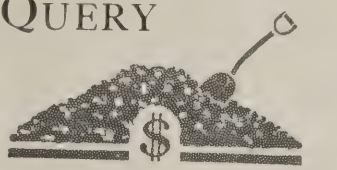
Vol. 7 NEW YORK, MAY 15, 1915 No. 20

Requirements of the Retail Dealer

It requires an occasional talk with a retail coal dealer to make the average coal-mining operator realize that there are many requisites in the coal business beyond the simple ability to load a certain number of railroad cars of coal (any old kind) per day, within a certain allowable cost per ton.

To make a success of the retail business a dealer must know the characteristics of each grade of coal produced by each coal mine selling coal within his territory.

QUERY



How Can the Retail Dealer Succeed if the Coal Operator Fails to Furnish a Uniform Product

?

He must forget that there is such a word as coal and do all of his thinking in terms of slack, pea, nut, egg and lump. His ability at diplomacy is tested by such terms as dirt, rock, slate and bone, and his salesmanship depends entirely on his understanding of ash, sulphur and clinkers.

The fuel demand for domestic purposes is divided between boilers, furnaces, grates and cook-stoves, and the dealer must be competent to recommend the most suitable grades for each of these purposes. Furthermore, his decision must often take into account the financial ability of the prospective purchaser, as well as his home habits and business reputation.

For example, a certain high-ash nut coal may be very economical as a furnace fuel, but one customer would rather pay a little larger fuel bill than be troubled with the extra bother because of the excessive amount of ashes. The next-door neighbor, perhaps not so well off in worldly goods, believes in cutting the initial cost of his fuel, and so is not concerned with the trips to the ash dump, but thinks only of the dealer's bill for the season.

A wide-awake retail coal dealer can get all the business he can handle if he can only succeed in getting close enough to prospective buyers, and providing most of his competitors are just average dealers, who encourage their customers to order without interesting them to the point where they request advice.

But after the retail dealer builds up his business on the basis of furnishing every customer just what he requires, think what it means to him if he finds that he cannot depend upon a uniform product from the mines.

In times like the present, when the steam-coal demand is an unknown quantity and the demand for domestic coal becomes the flywheel of the industry, the retail dealer and his requirements are worthy of pretty serious consideration on the part of mine operators.

Value of Daily Cost Sheets

By H. S. Mikesell*

SYNOPSIS—Cost sheets in order to be most effective must be prepared every day. Such a compilation need not take fixed charges on plant or equipment into account, but only such items as may be considered strictly as operating expense.

Western coal operators, as a result of several unprofitable years through which they have passed, augmented by the prevailing unsatisfactory business affairs resulting from conditions abroad, are in a critical position. Producers must act cautiously and keep closely in touch with operating costs. Many operators of coal mines do not conduct a system of accounting or daily costs that at all times reflects the actual current cost of production, which is the only basis on which selling prices can be legitimately figured.

The compilation of a daily statement showing the cost of production should be considered by every operator a necessity for each mine. On account of the close margin generally existing in this day between the costs of production and the selling price of coal it is highly important that a daily cost should be as accurate and comprehensive as possible, in order to enable the operator to see immediately whether or not his expenses are within proper limits.

Some mine owners delude themselves with the belief that monthly or semi-monthly cost sheets are sufficient, but figures so compiled are often too late to be of the benefit expected in reducing expenses or for use as a basis in figuring market prices of coal. Thus unnecessary expense may already have been incurred for some length of time, and when the monthly or semi-monthly cost sheets are analyzed it can only be eliminated for the future if such expenditure still continues. A daily cost sheet if properly used prevents this waste, because unnecessary expense is immediately seen and can be eliminated without delay.

At nearly every mine a clerk is employed to maintain payrolls, and with little additional labor on the part of such a clerk a cost sheet can be accurately and promptly prepared. A sheet of this nature to be of value and to enable immediate elimination of unnecessary expense should be compiled promptly, not later than the day following the one that it covers.

The objection has been raised that this cost sheet requires too much clerical labor, but it has been found that a clerk can correctly prepare such a sheet complete each day with two hours' work, and in many cases it is done in less time where the clerk has been accustomed to its preparation and is familiar with conditions. It is evident that it is just as important to compile a daily cost sheet as it is to maintain a payroll, if not more so, from the coal producers' standpoint. For the best mine management neither one can be eliminated without disadvantage.

Daily Reports Are Superior to Monthly Reports

The best results are secured when operating officials are brought face to face with the costs every day rather than when compelled to wait for monthly reports. If superintendents and mine managers are placed in touch with daily costs they are in a better position to immediately discover leaks, prevent useless expenditures of labor, and maintain the cost of production on a proper basis. At many operations the daily cost sheet is the subject of a discussion between the superintendent and his foremen each evening, and a free and frank expression of opinion on the points brought out by its compilation cannot but be helpful to all concerned in the management of a mine and cause reduction in expenses. At operations composed of a number of mines cost sheets are frequently interchanged and comparisons made which are found of great advantage in reducing expenses and keeping costs in the correct ratio with production.

A statement of this kind may with advantage be passed down daily to various under-officials, especially those items applying to expenses under their individual control. A foreman in order to maintain equilibrium will attempt, for instance, to neutralize an increased expense for haulage by a reduction of inside labor, particularly if he is able to ascertain quickly whether or not the number of men employed in each classification under his control is in conformity with the tonnage produced.

If idle-day expense is high and tonnage correspondingly reduced with increased cost, the mine manager will be acquainted with this state of affairs immediately upon analyzing the cost sheet and will be able to take intelligent steps to put his working-forces on a proper basis to maintain minimum costs. In the cost sheet idle-day expense is absorbed concurrently by the tonnage produced on working-days, which is proper, and is not deferred until the end of the month or some later period.

The daily cost sheet to be illuminating should present the same classification of accounts embodied in the monthly accounting results, and naturally if a coal company has a classification of accounts it should be followed in a proper order in compiling the cost sheet.

The accompanying form shows a cost sheet which has been used in the West with signal success. It is a condensed replica of the time-books or payrolls boiled down to one sheet to show all essential information applying to operating expenses.

Important Items That Are Covered

This cost sheet, which embodies a report of idle day expense, also brings out clearly the following information:

1. The cost per ton of the production on the day for which it is issued together with the total expense incurred.

2. Total operating expenses of the current month's production to date with cost per ton thereof.

3. Total operating expenses to same date of the previous month with cost per ton thereof. (This enables a comparison at any time of the current month's costs with the figures of the previous month and shows readily whether expenses are decreasing or increasing for an individual mine.)

4. The cost per ton of coal produced for each classification of expenses is currently indicated, together with

Amount of idle days estimate by general superintendent for current month	*	*			*	*
Amount of Sunday estimate by general superintendent for current month	*	*			*	*

* This mark to denote places figures must be inserted.

In computing "Costs Per Ton" boiler coal tonnage of each day must be subtracted from daily output.

Idle days must always include Sundays and holidays and periods embracing suspension of mining pending wage settlements.

In the columns reading "Increase" and "Decrease" show amounts of differences in expenses of idle days, not "Per Ton" figures.

In estimating Local Earnings use average revenue per ton for the current fiscal period shown for each mine in last monthly operating statement on hand. To arrive at the amount of Local Earnings, multiply production less boiler coal by the average revenue per ton. On idle days Local Earnings must not be estimated.

Cause for exceeding General Superintendent's Idle Day Estimate for this date, if so

Correct: Mine Clerk

DAILY COST SHEET WHICH HAS BEEN FOUND SUCCESSFUL BY THE ROCK ISLAND COAL MINING CO.

a comparison of the same expense up to the same time of the previous month. (By analysis of the sheet any one interested can note immediately under what classification of expense a decrease or increase is found as compared with the previous month.)

5. The number of men working under each classification, the hours worked, the rate of pay, the cost per ton for each item of labor, and the amounts earned by each classification of employees. (If an excessive number of men are employed in certain work as compared with what has been normally the case in the past, this may be readily seen. If rates of pay are not in accordance with wage agreements or do not conform to established usage, it may be discovered by means of this sheet.)

Some Charges Are Not Considered

This sheet applies only to operating expenses at the mines which are under the control of superintendents and mine managers, and it has not been considered necessary to include in this cost sheet fixed charges such as taxes, insurance and overhead expenses of executive officers and employees, which are usually arbitrary and with which the men on the ground have no connection.

The items of "rolls and deficient work," "yardage and room-turning" and "loss and damage" are for the purpose of this sheet estimated by payroll clerks on the basis of the previous month's actual figures, as well as the items of "general expenses" and "personal injuries," which may vary in actual amount from month to month. The item of "material" covers the actual value of supplies of all kinds used in or at each mine each day.

"Loss and damage" on this sheet covers the cost of labor and material used in repairing any damage, either in the mines or to the top works, tenement houses or other property, and expense in cleaning up débris resulting from fires, explosions, wind storms, cave-ins, etc. It is an account in which to place any extraordinary expense which is not found in the regular operation of a mine, so as to not disturb comparative costs or usual expenses.

Idle-Day Expenses Are Set Forth

Attention is directed to the feature reflecting idle-day expense. Where a mine is only operating part of the time the expense for idle time naturally increases the cost of production. It is consequently most important that a careful check should be maintained of labor employed under such conditions to prevent unnecessary expense.

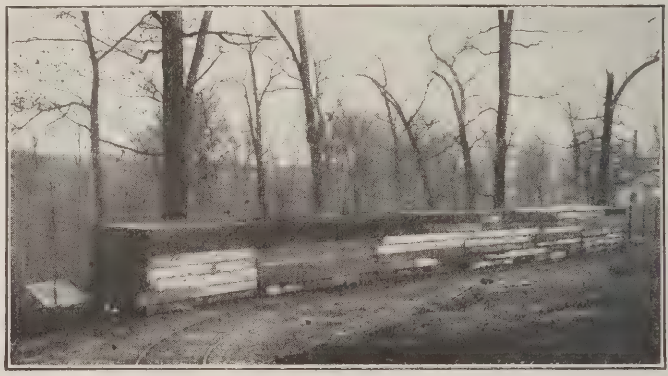
It has been the custom where this sheet has been in effect to have the superintendent make an estimate at the beginning of each month as to what the expense will be for Sundays and idle days during the following month, and if the actual idle-day expense exceeds the estimated figures an explanation is required.

Idle-day expense has been a most potent factor in disturbing expected costs of production, and it has been found that the showing of this information in the daily cost sheet has led to reduced expenses for idle days in mine operations. In several instances where the actual idle-day expense was increased over the estimated figures and an explanation asked, it has been found that help was employed unnecessarily. Economies have accordingly been introduced which would not have been the case had the idle-day expense not been considered as an element of cost.

The sheet has a column also for indicating the output of the mine on the day for which it is issued as compared with the same day of the previous month, and a comparison of the net output for the month up to the date it is issued compared with the same date for the previous month. It also shows an important item—the number of working-days to date as compared with the same information for the previous month.

Field Coal-Dust Explosion Gallery

A cheap and easily constructed wooden gallery for demonstrating the explosibility of coal dust at miners' field meets has been designed and tested with satisfactory results by George S. Rice and L. M. Jones of the Bureau of Mines.



"Mine Tunnel" Made of Scantling and Boards for Proving the Dangers of Coal Dust

The gallery is constructed of rough 1-in. boards, nailed to timber sets of 3x4-in. material, erected on 6-ft. centers. The gallery measures 7 ft. wide by 6 ft. high, inside of the timber sets, and should be approximately 85 ft. long; this length may be reduced somewhat if necessary.

Six inches beneath the roof are placed shelves of 1x12-in. material, which are supported, one at each timber set, by means of two nails driven into each of the uprights.

The gallery is left open at both ends; and 12 ft. beyond one end there is a cannon, consisting of a discarded 9-in. liner from an explosive-testing cannon, which can be supplied by the Bureau of Mines upon payment of trans-

The Wooden Tunnel after a Violent Explosion Has Wrecked It

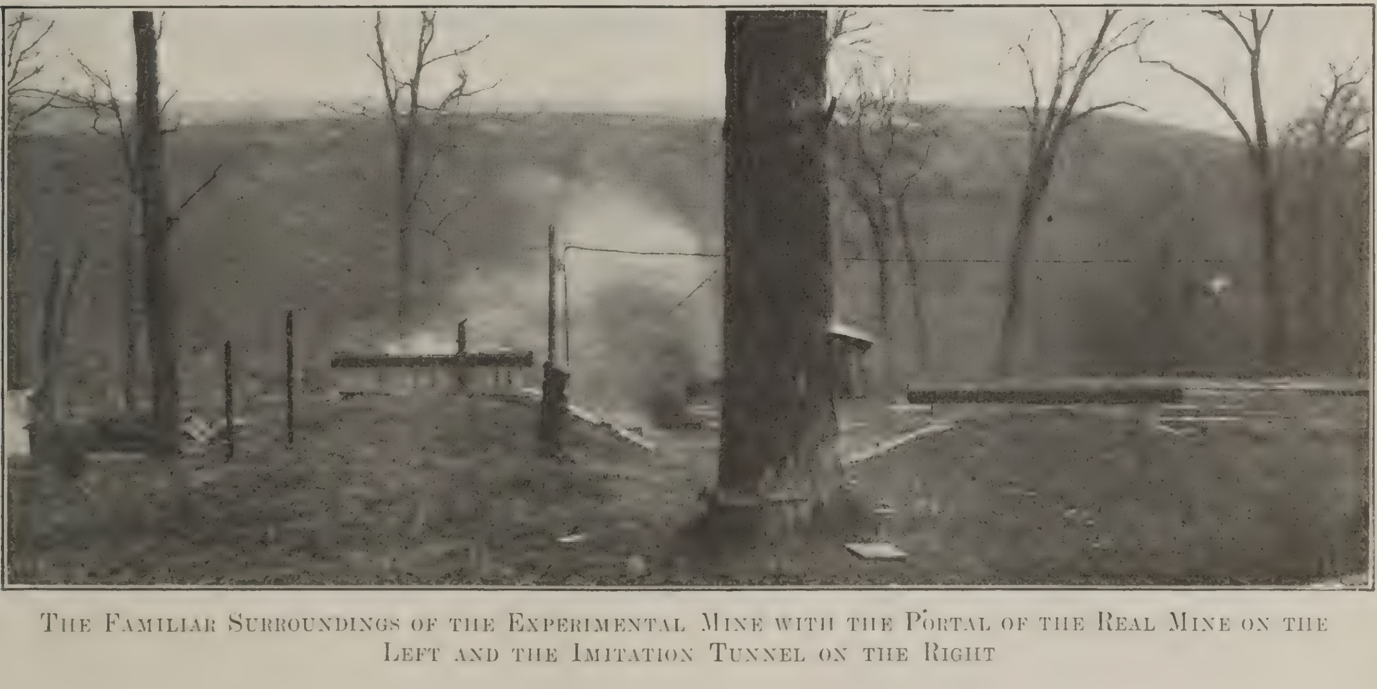
The Effect of Coal Dust Is Even More Apparent and Spectacular Than in the Boiler-Iron Gallery

portation charges. This is set on timbers so as to be a foot above the ground level and is placed with the borehole parallel to the axis of the gallery.

From in front of the cannon and extending to a point 3 ft. within the gallery, a platform on which to place dust is erected. A heavy wire is fastened to an eye-bolt screwed into the front of the cannon and is stretched over all of the shelves, being attached to each by a nail on the top side near the edge away from the cannon. The cannon is braced loosely by a timber, extending from it to a pile of dirt in the rear, so as to allow a recoil of from 1 to 2 ft. This recoil, by means of the heavy wire attached to the dust shelves, will effect the dumping of the dust.

Each of the shelves should be heaped with the dust to be tested and placed on the four nails of each timber set so as to be nicely balanced thereon and yet to be easily dislodged by the recoil of the cannon.

Coal dust should also be heaped on the platform in front of the cannon, extending therefrom for about 15 ft. so as to propagate the flame from the cannon to the dust within the gallery. Roughly, 200 lb. of coal dust will be required for each demonstration. Cannon should



The Familiar Surroundings of the Experimental Mine with the Portal of the Real Mine on the Left and the Imitation Tunnel on the Right be charged with 1 lb. of "FFF" black powder tamped with 3 lb. of clay.

When the cannon is fired, all of the dust shelves should fall so as to prepare a cloud for the propagation of the flame throughout the gallery. If the coal dust is inflammable, the flame will pass along the dust in front of the gallery and will then be sent through the cracks between the boards of the sides and roof, and finally emerge at the opposite end of the gallery. Wet the boards before each test to prevent their taking fire.

⁂

Extracts from a Superintendent's Diary

The highbrows and the college graduates haven't a monopoly on philosophy by any manner of means. I realize the truth of that every now and then. Today, for example, our night watchman, whom I have always looked upon as a matter-of-fact, unimaginative fellow, volunteered a few remarks that entitle him to be classed as a near-philosopher to say the least.

I decided a few days ago to purchase a watchman's recording clock for our camp and asked our commissary manager and our master mechanic to decide upon the key stations. The key boxes were put up yesterday, and late in the afternoon our watchman was given his clock and all necessary instructions when he reported for work.

This morning, on arrival at my office, I found him sitting on the steps awaiting my coming ready to turn in his resignation. Assuming that his feelings were hurt, I tried to explain to him that we had no desire to devise a check upon his faithfulness, but were simply adopting a method recommended by all of the insurance companies and now in use at most industrial plants. I assured him that the old hit-and-miss system of doing things was rapidly losing ground and scientific methods were coming into use, covering all operations even to regulating night watchmen's movements. He shook his head.

"That's just the point, Mr. Thompson. The idea is all wrong, and I won't be a party to it. Talk about reducing everything to a scientific basis—that's the line of argument that made possible fake rain-producers out West.

"I've been trying to figure out the why's and the wherefore's of things in general, and it looks to me as if the things that count are being done by folks who don't know how they do them nor why they do them. A fellow day-dreams that something is going to happen or ought to happen, and he takes advantage of the advance information; and in consequence when it happens he comes in for credit which he does not deserve and really does not care for.

"I've tested it out many a time in night watching. Some nights I spend most of the time loafing around the power house giving and taking experiences with the engineer, and then on other nights I get a feeling that tells me that trouble is in the wind or some one is trying to outwit me, and I keep on the move all night. That's how I've earned my reputation as a night watchman, and now you propose to make me operate on a scientific basis and keep me moving when it isn't necessary and like as not make me walk into trouble some night when I'll be dead sure that trouble is awaiting me, but I won't be able to avoid it because I'll be due at a certain place at an exact minute irrespective of consequences. Wouldn't three or four fellows of average intelligence have a time trying to get the best of me and my clock?

"Whenever I recall the events in my life that have meant something to me I realize that generally I was pushed into them in some unaccountable manner by a subconscious power.

"A fellow might plan a system for controlling his passions, but about the only men who give a value to prearrangement schedules for all future actions are the ones who write books of advice for growing boys.

"Not being in sympathy with men of that school, I'll have to resign; and, Mr. Thompson, I suggest that you get a sleepy-headed fellow who has no imagination to take my place."

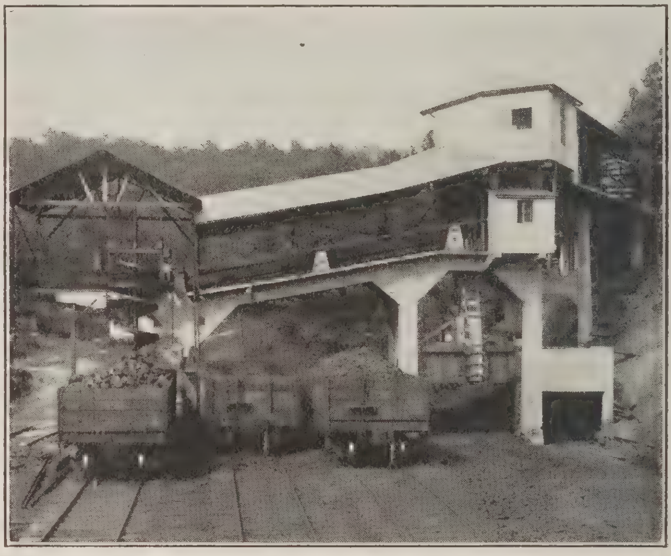
These were his exact words as near as I can recall them, even to that phrase "subconscious power."

⁂

Concrete Tipple Construction

By E. L. Douglas*

The accompanying illustration shows the reinforced-concrete tipple of the Jellico Coal Mining Co. at Mountain Ash, Ky., built by the Associated Engineering Co., of Louisville, Ky. The tipple capacity is 1200 tons. Special features are screen hangers which require only 15 hp. to run under full load. The screens are adjustable from the sides so as to change the size of the coal by turning a wheel instead of having to take out the plates.



Jellico Coal Mining Co.'s Concrete Tipple at Mountain Ash, Ky.

Block coal is handled from the screen to the railroad by an adjustable spiral loader, which is shown in the cut. When the railroad car is placed for loading, the spiral chute is dropped to the bottom of the car and is gradually raised to the crowning point as the coal fills the car. The spiral loader is counterweighted and is handled by one man operating a chain wheel. No motive power is required.

⁂

In the construction of coke ovens one authority recommends ganister bricks, built in with sagger clay mortar, these bricks and the clay partly fusing and making a lasting, airtight oven.

---

*General manager, Jellico Coal Mining Co., Mountain Ash, Ky.

Fire at Black Hawk Mine, Utah

SYNOPSIS—A severe fire in a Utah mine is extinguished with the aid of oxygen apparatus after a fight lasting 59 days. It is thought that an incendiary started the fire.

The Black Hawk mine of the Black Hawk Coal Co. is located near Price, Carbon County, Utah. About midnight of Jan. 31 of this year the night inspector discovered a fire at the mine.

Its origin is unknown, but the general belief is that it was started by an incendiary. An alarm was given, but the mine being reached by an inclined plane a mile long and being located at an elevation of about 750 ft. above the tipple, it was 3 a.m. before much help arrived. By that time large volumes of smoke were escaping from the fanway, and it was realized that the fire had made much progress. There are four openings within 100 yd., consisting of a manway on the north, a double-track main gangway, a ropeway and a fanway.

RESCUE CREWS AT THE BLACK HAWK MINE FIRE NEAR PRICE, UTAH

THE HOIST BEING UNDERGROUND, IT WAS PUT OUT OF COMMISSION

As the haulage engine was located 200 ft. inside the mouth of the drift, an effort was made to shut off the hoistroom from all connection with the fire so as to have the use of the engine to raise material with which to subdue the conflagration. This attempt was unsuccessful, for the heat and smoke drove the men out. Consequently it was decided on Feb. 1 to seal up the mine, and work was started with this end in view.

A slight explosion occurred at noon on Feb. 1, from which no casualties resulted. By noon of the next day all the openings except the manway and the small ropeway had been closed. At that time a second explosion occurred by which half a dozen men were slightly injured.

The mine was completely sealed the next day, and as there was no water available and as hauling material by teams up the long and steep plane was a slow arrangement, preparations were made to install a pumping plant and a haulage engine.

On Feb. 1 government rescue car No. 2 in charge of J. C. Roberts, with his assistants, George W. Riggs and C. S. Arthur, arrived from Bingham, Utah; J. E. Pettit, state mine inspector, arrived on Feb. 2.

TRIED TO VENTILATE WITH A CENTER STOPPING

The company had its own rescue and first-aid car, five helmets and many trained helmetmen. These were organized into squads, and other men were trained to supplement the regular force. By the middle of the month, everything being ready, including an electric hoist, a new pipe line a mile long and the necessary pumps, two squads of helmetmen made trips into the mine, one going into the main gangway and manway and the other going into the fanway and first-east heading. These two teams approached within 200 ft. of each other, the fire being between them. They found the mine filled with an unbreathable atmosphere and very hot.

They returned to the outside, and it was decided to split the main gangway with a cloth brattice, to put a small blower on one side and with the aid of this provision try to reach the fire with hose. This scheme was tried as soon as practicable, and rapid progress was made for awhile, but on the 23d the smoke became so dense and the heat so severe that the men were all driven out, and the mine was resealed.

ONE FATALITY WHILE EXPLORING FIRE AREA

It was opened again on Mar. 1, and several squads of helmetmen went in, and on the evening of that day the first and only fatality occurred. One of the helmetmen was overcome when on the first-east close to the fire and about 1100 ft. from the outside. He was taken out, but never recovered consciousness.

It was then determined that the right course was to load out the material instead of trying to reach the fire and quench it with water. This work was started on Mar. 5 and continued for several days, and by the 11th the fallen material was cleared up to a point back of the hoist and the latter put into commission. However, in the afternoon of that day smoke came out in such volumes that the men were driven out, and the mine was sealed up for the night. Work was started the next day and continued for three shifts, when the men were again driven out, and the mine was resealed.

Fire Causes Thousands of Tons of Coal to Fall

This advance and retreat occurred at intervals until Mar. 30, when the fire was finally extinguished; and regular operations were resumed on Apr. 1, though much fallen material remained to be cleared up. Only a few tons of rock roof had fallen, but the seam being 18 ft. thick or thereabouts, several thousand tons of coal had come down, though the fire had not reached it. At some points 8 ft. of coal had chipped off in small pieces, and where this occurred the roof was in every case arched by the fall. On the whole, little damage was done to the mine, though the quenching of the fire was very expensive.

The company was fortunate in having the services of such experienced mine-fire fighters as J. E. Pettit, the state inspector of mines, J. C. Roberts, mining engineer in charge of United States rescue car No. 2, and Robert Howard, the company mine inspector. The latter was put in charge of the details of the operation by Vice-President J. F. Healy, and with the other two experts composed, as it were, a "board of strategy."

Deputy State Mine Inspector Smith also rendered valuable service, as did also Superintendent Garvey, of the Mohrland colliery, who had charge of the night shift. The company was also fortunate in getting the federal mine-rescue car so promptly, and is to be congratulated in that it was manned by such competent men, to whom too high praise cannot be given.

Bravery of the Mine Employees

It is pleasant to note the vigor, fearlessness and zeal with which all the company employees who were called upon responded. Not one of them refused to do his part. None of them showed the least hesitation in working in high temperature and bad air and under roof which might be dangerous. The loyalty shown throughout could not be exceeded and was most highly appreciated by the company. In acknowledgment, it has donated $1000 to the amusement clubs to be used to the best advantage of all its employees. It will also present medals to the helmetmen, who did some exceptionally good work and who undoubtedly saved some lives on Mar. 1. On that occasion the indefatigable safety superintendent, A. W. Dennison, was overcome while assisting another helmetman out of the mine.

"Safety first" was adopted as a binding rule from the beginning and was never overlooked. Aside from the one death, the rule was successful in preventing fatalities.

Determination of Gases

Roy Stevens, chemist of the United States Smelting Co., of Midvale, Utah, began analyzing the mine air on Feb. 4 and continued for a couple of weeks, and was followed by J. B. Forrester until the end of the work. About 200 analyses were made, each in a surprisingly short time, not more than 20 min. being required in some cases to determine the presence or absence of explosive gases, illuminants, carbon monoxide, carbon dioxide, oxygen and nitrogen. As the tests were many and quickly made they were of great help to those engaged in the work. No explosive gases have ever been found in the mine, but it was felt that possibly some might be made by the fire.

The operations in extinguishing the fire occupied 59 days, and during that period 20 or more Draeger oxygen apparatus were in use. These met the test satisfactorily, nothing but ordinary repairs being necessary such as long-continued use might be expected to require. J. E. Pettit, the state mine inspector, declares that without such equipment the fire could not have been extinguished.

Deaths at Layland Mines

From E. A. Henry, chief of the Department of Mines of West Virginia, we have received a complete list of the persons killed at the Layland, W. Va., explosion, and from that account the following enumerations have been made. Figuring by nationalities there were 36 Americans (including 1 negro), 28 Austrians (including 4 Austrian Poles, 3 Slavish Austrians, 3 Slavs, 1 Pole, 2 Bohemians and 3 men not classified, but with names suggesting Austrian nationality), 22 Italians, 21 Russians, 2 Syrians, 2 Scotchmen, 1 German, 1 Spaniard, 1 Welshman and 1 Englishman. In all there were 115 victims.

Grouping by occupations there were 85 miners, 7 triprunners, 5 tracklayers, 4 motormen, 2 mine foremen, 2 motor-runners, 2 stonemasons, 1 slate-man, 1 pumper, 1 substation man, 1 electrician, 1 store porter and 3 men who were not yet on the payroll.

American Coal for Brazilian Railway

The Central Railway of Brazil (Estrada de Ferro Central do Brasil), a government line, has recently approached an American concern here, says Consul General Alford L. M. Gottschalk, with a proposition to purchase 20,000 tons of Pocahontas coal. The price is said to be $15.09 per ton.

The Central Railway has had special permission from the government to make its purchases of coal for cash and to meet payments therefor out of its actual cash receipts month by month. The director of the road states that it consumes 300,000 tons of coal per year.

COMING MEETINGS

International Railway Fuel Association will hold its annual meeting at Chicago, Ill., May 17-20. Secretary, C. G. Hall, 922 McCormick Bldg., Chicago, Ill.

Oklahoma Operators and Miners Association and U. S. Bureau of Mines will hold a state-wide first-aid meet at McAlester, Okla., on May 22, 1915.

Retail Coal Dealers' Association of Texas will hold its meeting May 25-27, 1915, at Galveston, Tex.

The Illinois Mining Institute will hold its next meeting at Danville, Ill., May 27-29, 1915. The officers of the Institute are: President, J. W. Starks, Georgetown, Ill.; first vice-president, William Burton, Herrin, Ill.; second vice-president, Fred C. Pfahler, Belleville, Ill.; secretary and treasurer, Martin Bolt, Springfield, Ill.

Rocky Mountain Coal Mining Institute will hold its next meeting in Trinidad, Colo., June 8, 9 and 10. Secretary, F. W. Whiteside, Denver, Colo.

West Virginia Mining Institute will hold its summer meeting at Wheeling, W. Va., June 15 and 16. Secretary, E. N. Zern, Morgantown, W. Va.

The American Society of Mechanical Engineers will hold its summer meeting at Buffalo, N. Y., June 22-25, 1915. Secretary, Calvin W. Rice, 29 W. 39th St., New York City.

M. O. I. Coal Association annual meeting will be held June 22-25, 1915, at Cedar Point, Ohio. Secretary, B. F. Nigh, Cleveland.

The American Institute of Electrical Engineers will hold its annual convention June 29 to July 2, 1915, inclusive at Deer Park, Md. Headquarters will be at the Deer Park Hotel. Secretary, F. L. Hutchinson, New York.

Comparative Costs of Motor-Truck and Wagon Delivery[*]

By Henry L. Miller[†]

SYNOPSIS—An analysis of the comparative costs of delivering coal by motor trucks of different sizes and by teams. The article is based on carefully compiled data covering a period of several years, and due allowance has been made for all the variable conditions. Prospective purchasers of motor trucks will find much of interest in the article.

Views Showing Truck Dumping and Normal

The figures presented herewith show the performance and averages on one 4-ton truck for two years, one 4-ton truck for one year, one 2-ton truck for five months and one double team and one single team for one year. Each study is divided into periods of six months, with the exception of the 2-ton truck, which has been in commission only five months.

In our efforts to ascertain the difference in the cost of truck and team delivery we found it quite necessary to know the average number of miles made by the teams.

TABLE SHOWING COMPARATIVE RESULTS OF DIFFERENT MOTOR TRUCKS AND TEAMS OVER SIX-MONTH PERIODS

	4-Ton Truck No. 50				4-Ton Truck No. 60		2-Ton Truck No. 70	Double Team		Single Team	
Six-month period	1st	2nd	3rd	4th	1st	2nd	*	1st	2nd	1st	2nd
Days operated	124	148	121	111	131	146	118	149	145	151	147
Days idle	2	4	27	43	14	8	8	3	9	1	6
Miles	3324	4822	3345	2894	3386	3970	2808	1717	1574	1950	1647
Tons	2503	2893	2625	2710	2611	3467	1200	1349	1347	695	627
Expense	$1.82	$3.29	$6.19	$4.49	$1.852	$3.07	$0.86	$2.04	$2.04	$1.02	$1.02
Overhead	5.78	5.78	5.78	5.78	5.597	5.74	3.42	1.00	1.00	0.55	0.55
Total (per diem)	7.60	9.07	11.97	10.27	7.449	8.81	4.28	3.04	3.04	1.57	1.57

Helpers	3.50	3.50	3.65	3.37	3.50	3.50	3.66	1.94	1.88	0.48	0.72
Total	14.10	15.57	18.62	16.64	13.95	15.31	10.44	7.31	7.25	4.22	4.46
Averages:											
Miles per day	26.8	32.5	27.64	26.07	25.84	27.19	23.80	11.52	10.85	12.91	11.20
Tons, per day	20.19	19.54	21.69	24.41	19.93	23.75	10.17	9.05	9.29	4.60	4.27
Load in tons †	4.00	4.00	4.11	4.08	3.97	3.96	2.11	2.25	2.41	1.03	1.00
Trips per day	‡	‡	5.28	5.98	4.98	5.99	4.81	4.01	3.86	4.45	4.27
Miles per trip	‡	‡	5.24	4.36	5.18	4.54	4.94	2.87	2.81	2.90	2.62
Cost per mile	0.526	0.479	0.673	0.638	0.539	0.563	0.438	0.634	0.668	0.326	0.398
Cost per ton-mile	0.135	0.119	0.164	0.156	0.135	0.142	0.208	0.282	0.277	0.317	0.398

*For a five-month period only. † Estimated. ‡ Figures not available.

Answers to inquiries made in a number of different directions were so much at variance that we endeavored to find some kind of an instrument that would register the mileage of a heavy wagon. A little more than a year ago we found such an instrument and have kept our mileage on two teams for twelve months. We also found that in order to make a fair comparison we should keep a record of the helpers furnished the trucks and the teams, and this has been done for the twelve-month period.

In presenting these figures I am well aware that both the performance and the cost will differ greatly from figures that many others have kept. I know that the average load will appear small and the cost per ton-mile large as compared with the results obtained by dealers in the vicinity of Boston; it is therefore necessary that a brief statement be made as to conditions under which the coal dealer in Worcester labors.

Worcester is the "City of the Seven Hills," and what the hills are can better be appreciated after one has done business there. We are sometimes able to place on our double teams a load as great as 7000 lb., but on long trips we seldom put on more than 6000 lb., and many times only 4500 lb.; and in all cases where hills are steep, teams go together, taking lead chains with them and helping each other over the heavier grades, or else they have to go loaded very light. Our average haul is long and is growing more so each year.

[†] Secretary, Claflin-Sumner Coal Co., 9 Pleasant St., Worcester, Mass.

[*] Paper presented at the New England Coal Dealers' Association meeting at Boston, Mass., Mar. 24 and 25.

There has been no attempt to make a record with either trucks or teams. Our truck record might have shown a much lower cost per ton-mile had we exceeded the rated capacity in our loading, but we have strictly avoided overloading, and while our figures for the first and second year are high we anticipate a considerable saving over a period of three or more years. I do not mean to infer that we have never loaded our 4-ton trucks with more than 8000 lb., but where we have loaded in excess of the rated capacity it was always under conditions where the load could be handled with perfect ease.

Overhead Charges and Depreciation

Our charges for expense on our trucks include the amounts actually paid out for gasoline, oil, grease, repairs, tires and sundries. Our overhead charges include depreciation and insurance, the latter covering employers' liability, property damage and fire insurance. Our depreciation we have figured at 33⅓ per cent. per year. We recognize that this is a much larger amount than has probably been given you for depreciation by truck salesmen, but careful inquiries in many directions have led us to adopt this figure. Should it prove at the end of three years that we still have a value left in our trucks, the cost of running will be decreased an amount equal to the value of the truck at that time. In our per-diem charge we have added to the expense and overhead charges the amount paid the driver and the average daily amount paid for helpers during each period of six months.

In our cost for team delivery we include the actual expense per day as shown by an average taken from records kept for four years. To this we have added overhead charges, which include employers' liability insurance, property damage insurance, fire insurance and depreciation. Our depreciation is based upon a cost of a horse at $300 with harness and wagon at $450. We have placed the life of a horse at six years and the average life of a wagon and harness at ten years.

Uses of Trucks and Wagons

The 4-ton trucks are equipped with power body-hoists and are used as much as possible where we can load them from overhead. They handle considerable bituminous coal where loads can be dumped and have also been used for family trade where a single order amounts to four or more tons. We have also used them for two or more orders on one delivery in a few cases, but have found this expensive.

The 2-ton truck has been used very little in manufacturing business, but has been confined more particularly to long distance 2-ton domestic trade; it is also often called upon to carry two or more orders on one trip. This is a more expensive delivery than is put to the 4-ton trucks, as will be noted on the record.

Double teams are kept as much as possible on not less than 2-ton orders, but sometimes we are obliged to load them with several orders on one trip.

Small business, such as quarter-ton and half-ton loads, goes usually to single teams, getting as many orders on one trip as can be conveniently delivered. Even then, such delivery is expensive, as will be seen from the record.

Mining Exhibits at the Panama Exposition

The accompanying sketch shows in detail the plan and sectional views of the demonstration mine installed by the Bureau of Mines in the Palace of Mines and Metallurgy at the Panama-Pacific Exposition. This interesting installation is located beneath the floor of the building and is entered through a shaft and slope in the southern end of the Bureau of Mines space.

Palace of Mines and Metallurgy at Panama-Pacific Exposition

In the exhibit of the Bureau of Mines modern methods of rescue and recovery work are illustrated by trained men using Fluess, Draeger and Westphalia types of breathing apparatus. Two daily explosion demonstrations are given by the Bureau of Mines corps at the demonstration mine. One feature of this exhibit is the rescue of a supposed victim from a gas-proof smoke-room. There is also an extensive display of safety lamps from the earliest type

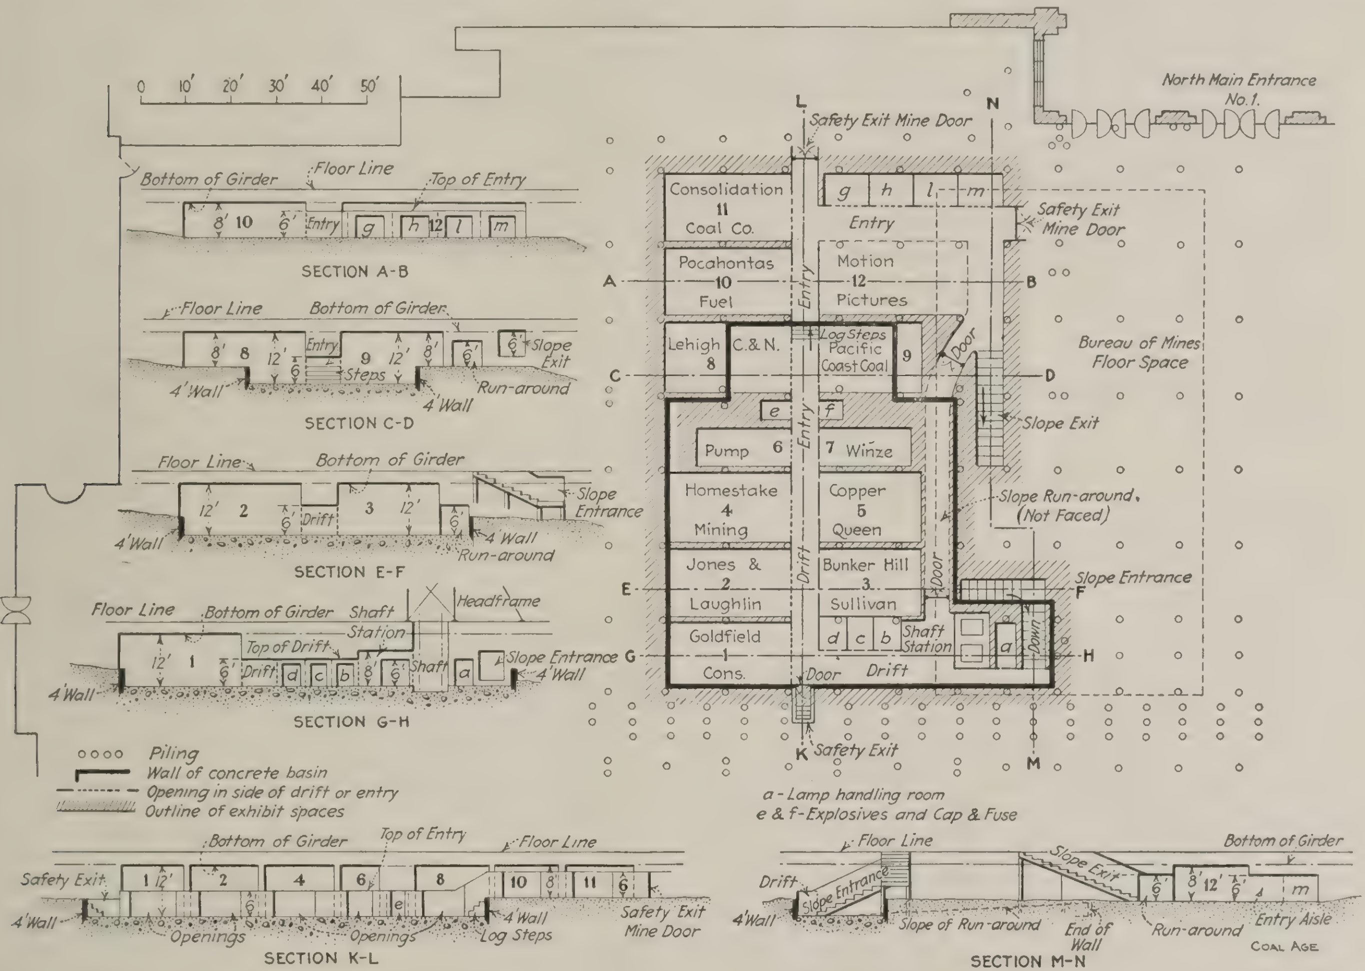
Part of Carnegie Steel Co.'s Exhibit

to the most modern permissible double-bonneted lamp. Another exhibit covers the matter of mine explosives and shows all the materials that are available in the manufacture of these explosives. Methods of testing explosives are illustrated by a carefully arranged photographic display.

The welfare exhibit of the bureau shows a model village and an ideal industrial arrangement of water-supply, hospital, recreation room, wash-house, etc. A model is shown of a wash- and change-house as an illustration of how such a building should be designed.

The explosibility of coal dust is illustrated by an apparatus which shows how finely divided coal dust in contact with a sufficient amount of oxygen becomes just as explosive when ignited as black powder. Another display shows a model of a rock-dust barrier designed by the engineers of the Bureau of Mines. Still another exhibit illustrates the loss that occurs in burning coal in various types of boiler furnaces.

In "the mine" is a motion-picture theater, in which methods of mining and handling coal are shown continuously throughout each day. Beyond this is an actual reproduction of full-sized entries, drifts, stopes and rooms selected from typical mines in various parts of the United States. Mining machinery and different appliances used in modern practice are shown installed ready for operation. Individual exhibits of large American mining companies may be located from the sketch.



PLAN AND SECTIONAL VIEWS OF "THE MINE" AT PANAMA-PACIFIC EXPOSITION

Arizona Has but Little Coal

Frank C. Schrader, of the United States Geological Survey, says in a report on the "Mineral Deposits of the Santa Rita and Patagonia Mountains, Arizona," that a deposit of lignite is reported to occur near the Whetstone mountains on the western edge of Cochise County in the southeastern corner of the state.

The thickness of the coal-bearing strata is about 40 ft., and the beds occur conformably in a formation of inclined sandstone and shale or slate which is apparently Mesozoic. The area thus enriched with lignite is said to have a known extent of nearly half a mile.

At one point R. R. Richardson opened the deposit by a 40-ft. shaft, but the coal, which was of low grade at the surface, was found not to be improved perceptibly at that depth. The shale on being rubbed or pounded with a hammer is said to give off a petroleum odor, but no oil seepage is reported. Plentiful remains of petrified trees, some about 100 ft. long, are found.

Nearby, Messrs. Fairlee and Jenson, of Benson, discovered and opened two beds, likewise lying conformably in sandstone and shale, which here incline at 22 deg. to the horizontal. The beds are about 8 ft. apart, and the coal is said to be of good grade. It was used with good results on the forge for sharpening miners' tools. But the thickest bed does not much exceed 4 in., so after developing the ground for a distance of about 1000 ft. the work was abandoned.

Comparison of Coal Consumption with that of Other Fuels

By A. A. Potter* and W. A. Buck†

SYNOPSIS—A valuable analysis of some coal statistics from the census reports, supplemented by data from other sources. A detailed comparison is made of the output of coal and other fuels in all sections of the country. Bituminous and anthracite coal made up 84 per cent. of the fuel consumed for manufacturing purposes in 1909.

Table 1 and Fig. 1, compiled from the U. S. Census Reports for 1913, show the amount and value of coal, petroleum oil and natural gas produced in the various sections of the United States.

The New England States have no fuel resources, while the Middle Atlantic States, which include New York, New Jersey and Pennsylvania, produced fuel valued at $434,317,220 in 1913, which is 40 per cent. of the total production of the United States.

The East North-Central division, which includes the states of Ohio, Indiana, Illinois, Michigan and Wisconsin, ranks second in the value of fuel produced. In 1913 this amounted to $193,454,756, or 17.8 per cent. of the total for the United States.

The South Atlantic States ranked third, producing 13.8 per cent. of the total fuel; the West South-Central fourth, with 10.5 per cent.; the Pacific fifth, with 5.25 per cent.; the East South-Central sixth; the Mountain States seventh; the West North-Central eighth, with only 3.6 per cent.; and the New England States last.

The states producing the greatest value of fuel in each of the various divisions are: Pennsylvania in the Middle Atlantic, Illinois in the East North-Central, Kansas in the West North-Central, West Virginia in the South Atlantic, Alabama in the East South-Central, Oklahoma in the West South-Central, Colorado in the Mountain States and California in the Pacific States. The Mountain and Pacific States have probably a greater percentage of undeveloped fuel resources than any of the other divisions in the United States.

TABLE I. FUEL PRODUCTION IN THE UNITED STATES, 1913

*Dean of the division of engineering and professor of steam and gas engineering, Kansas State Agricultural College.

†Fellow in steam and gas engineering, Kansas State Agricultural College.

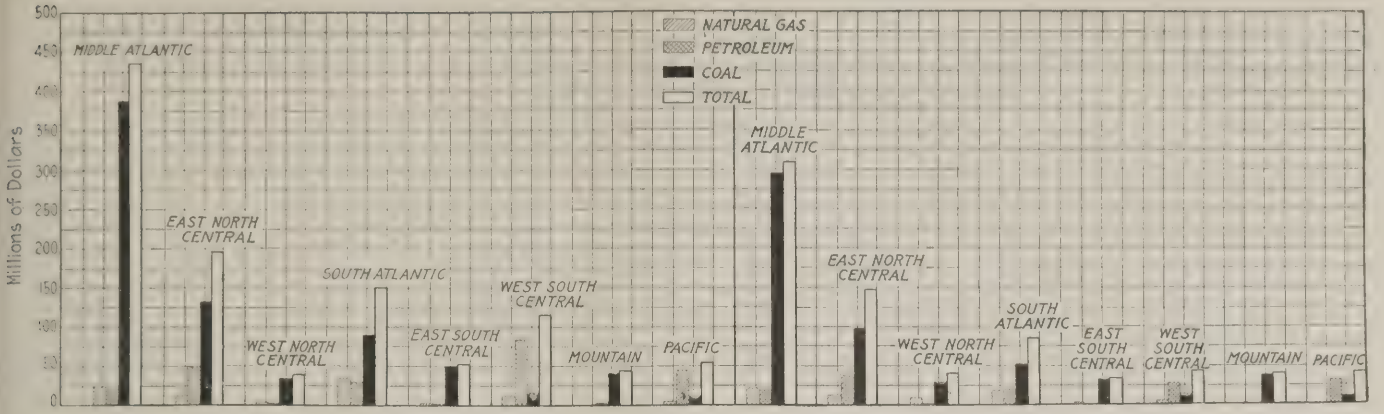

Fig. 1. (1913) Fig. 2. (1910)

Value of Fuel Produced in Various Divisions of the United States

The amount of coal, oil and gas produced in the various divisions in 1910 is shown in Fig. 2. Table 2 shows the relative values of the various fuels in the manufacturing industries. Bituminous coal constitutes over 87 per cent. of the total fuel used in manufacturing, when including the manufacture of coke. Anthracite coal ranks second as a fuel for manufacturing purposes; oil, including gasoline, ranks third; wood fourth, and gas fifth, the calorific value of the gas utilized constituting only 0.01 per cent. of the total value of fuel in manufacturing. This comparison is even more marked in Fig. 3.

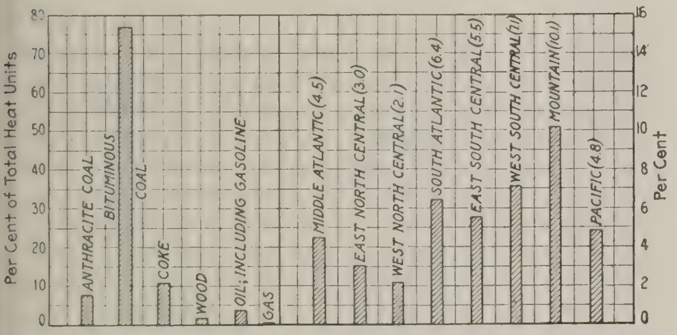

Fig. 3

Heat Value of Fuels Used in U. S.

Fig. 4

Ratio between Value of Fuel and Manufacturing

An analysis of different lines of manufacture revealed the fact that the cost of power varies from 1 to 3 per cent. of the total production cost in the majority of factories. Exceptions to this are probably cement and glass factories, where the cost of fuel is 10 to 30 per cent. of the total cost of manufacturing.

TABLE 2. FUEL USED FOR MANUFACTURING IN U.S.A., 1909

Source: Bureau of Census, Department of Commerce and Original Calculations

Kind of Fuel	Quantity	Equivalent Heat Value in Thousands, B.t.u.	Per Cent. of Total Heat
Anthracite coal........	14,339,220 long tons	439,000,000,000	7.74
Bituminous coal*......	161,792,218 short tons	4,368,000,000,000	76.93
Coke................	37,959,970 short tons	592,000,000,000	10.43
Wood................	5,481,311 cords	82,220,000,000	1.45
Oil, including gasoline.	34,331,632 bbl.	193,700,000,000	3.44
Gas................	451,302,493 cu.ft.	428,700,000	0.01
Total..............		5,677,348,700,000	100.00

* Includes 58,788,398 tons used in making coke.

Note: The calculations of the British thermal unit for the various fuels were made in accordance with the following:

Anthracite coal 13,700 B.t.u. per pound, or 30,650,000 B.t.u. per long ton.

Bituminous coal 13,500 B.t.u. per pound, or 27,000,000 B.t.u. per short ton.

Coke 7800 B.t.u. per pound, or 15,600,000 B.t.u. per short ton.

Wood average 2500 lb. per cord and 6,000 B.t.u. per pound, or 15,000,000 B.t.u. per cord.

Oil, including gasoline, 19,000 B.t.u. per pound, or 5,700,000 B.t.u. per barrel of 300 pounds.

Gas (natural) 950 B.t.u. per cu.ft.

TABLE 3. RELATION BETWEEN THE VALUE OF FUEL AND OF MANUFACTURING FOR U.S.A., 1909

Source: Bureau of Census and Geological Survey

Division	Value of Fuel	Value of Mfg. Products, Thousands of Dollars	Ratio of Fuel to Mfg. Products
New England...........	0	2,670,065	0.0
Middle Atlantic.........	318,267,468	7,144,761	0.045
East North-Central......	146,909,319	5,211,703	0.028
West North-Central.....	38,524,438	1,803,900	0.021
South Atlantic..........	88,864,143	1,381,187	0.064
East South-Central......	34,461,643	630,488	0.055
West South-Central......	41,346,943	625,443	0.066
Mountain..............	37,124,716	363,996	0.101
Pacific................	40,705,122	843,512	0.048
Grand total..........	746,203,792	20,675,055	0.0361

Table 3 and Fig. 4 were compiled from the 1910 Census to show the relation between the value of the fuel resources and of the manufactured products for the various divisions of the United States. The New England States have no fuel resources, while the Mountain States show the greatest ratio, which means that but little of the fuel produced in that division is utilized for manufacturing purposes.

⁂

Anthracite Litigation—Confusion exists in some quarters regarding litigation pending against anthracite roads. For years this group has had the attention of the Attorney-General and the Commerce Commission, and there are now several cases of prime importance to the "hard-coalers."

Arguments were made Jan. 16 and 17 at Washington in general investigation by the Commerce Commission into rates and practices, the most inclusive investigation ever made of this much-probed subject. The carriers have been put on the defensive to justify existing interstate rates for carrying anthracite both east and west from Pennsylvania fields. The commission has under consideration the evidence and arguments, but opinion among interests which have followed the case is that decision may not come down until after the summer recess.

The other case of prime interest pending is the dissolution suit against the Reading system, including the Reading Ry. Coal Co., Jersey Central, Lehigh & Wilkes-Barre Coal Co., various smaller companies and various individuals. Final arguments were made last June before the Federal Court at Philadelphia. Decision may come any day.

Arguments were made before Judge Hough in the Lehigh Valley dissolution suit last November, and decision was rendered late in December dismissing the government complaint, the court digesting the evidence with refreshing promptness.

There are several reasons, however, why decision in the Reading case should be longer delayed. There are three judges considering the Reading, and only one heard the Lehigh evidence. The Lehigh, too, was much less complicated. This is the third time dissolution proceedings have been brought against the Reading, and naturally every case takes longer than the ones that went before.

The lower courts have decided against the government in proceedings against the Lehigh Valley and against the Lackawanna, but in each an appeal has been taken to the Supreme Court.—"Boston News Bureau."

The Wage Scale in the Coshocton District

SYNOPSIS—A rate of 55c. for run-of-mine machine-mined coal for wide work is secured by the Coshocton miners. The allowances for narrow rooms and car pushing are of much interest.

The following agreement was reached by the miners and operators of the Coshocton district of Ohio and was signed on Apr. 12, 1915, after a strike of over a year. The text is given almost word for word throughout, omitting, however, the preamble and all references to the Columbus agreement of Mar. 10, 1898, and the scale committee's report of July 3, 1914. The agreement will regulate wages till Mar. 31, 1916, that date closing a period of two years since the previous contract expired. It applies to No. 6 bed in Coshocton County, Ohio.

PICK-MINING SCALE

Mining, per ton	$0.716
Driving entry, taking top or bottom 5 ft. high from rail, per yard	2.34
Driving entry, under top, per yard	1.73
Break-throughs, between entries, for coal, per yard	1.73
Room break-throughs, single-entry system, for first break-through, per yard	1.73
Room break-throughs, single-entry system, after first break-through, per yard	1.00
Room break-throughs, double-entry system, per yard	1.00
Room turning, per yard of neck	.88
Rock shot in room necks, two yards	1.50
Four-yard wide places, per yard	1.05

CHAIN-MINING MACHINE SCALE

Cutting, wide work, per ton	$0.11
Cutting, narrow work, per ton	.13
Drilling, shooting and loading in rooms, per ton	.44
Drilling, shooting and loading in entries, per ton	.503
Room turning, cutter and loader, entry price	.503
Break-throughs, between rooms, loader, per ton	.471

Entry price is based on 12 ft.

THREE-RUN WIDE PLACES

Cutting with chain machines, three-run wide places	$0.16
Drilling, shooting and loading, three-run wide places	.538

INSIDE DAY-WAGE SCALE

Tracklayers, drivers, trip-riders, bottom cagers, water haulers, machine haulers, timbermen, wiremen and motormen, per day	$2.84
Tracklayers' helpers, per day	2.62
Trappers, per day	1.32
Pipemen, for compressed-air plants, per day	2.77
All other inside day labor, per day	2.62

OUTSIDE DAY-WAGE SCALE

Blacksmith, per day	$2.84
Blacksmith's helper, per day	2.18
Trimmers and carpenters, per day	2.49
Dirt dumpers, drum tenders and pushers-in, per day	2.22

RULES

Rule 1—Eight hours shall constitute a day's work and all mines may operate six days a week. An eight-hour day means eight hours' work in the mine at usual working places for all classes of inside day labor. This shall be exclusive of the time required in reaching such working places in the morning and departing from the same at night. Drivers shall take their mules to and from stables, and the time required in doing so shall not be regarded as any part of the day's labor, their work beginning when they reach the change at which they receive empty cars; but in no case shall the driver's time be docked when he is waiting for such cars at the point named.

Rule 2—Operators shall remove water from working places at the starting time or pay the miner a fair price for so doing, to be fixed by the miner and mine boss. The operators shall furnish facilities for handling the water when the miner is required to remove it. When water is bailed in barrels by the miner, 5c. per barrel shall be paid.

Rule 3—When bone coal and slate fall unavoidably in the working place it shall be removed promptly by the operator, or the miner shall be paid at the rate of inside day labor for so doing. This rule shall not apply in cases where it is determined that the bone coal or slate comes down through careless drilling, shooting or posting.

Rule 4—The price to be paid for clay veins, bottom rolls or horse-backs, shall be determined between loader or miner and mine boss. If they fail to agree the price shall be settled by the mine committee and mine boss.

Rule 5—Where a miner, loader, machineman or other employee, upon whose work other employees of the mine are dependent, absents himself from duty for two consecutive days without giving advance notice when possible to the mine boss, he forfeits his position. Sickness and unavoidable accidents are excepted.

Rule 6—Machine loaders shall not be charged for blacksmithing.

Rule 7—There shall be no free turns allowed in either rooms or entries. The turn must be made uniform at least once each week.

Rule 8—The check-off for the United Mine Workers' organization shall remain in force and be observed; the same to be deducted as a percentage of earnings. This is to include all dues and assessments for the organization.

Rule 9—The machinemen shall be required to cut coal level and close to the bottom and in no case shall the thickness of coal left exceed 4 in., except in case of pots or other extreme variations, and all machinemen leaving more bottom than the amount specified must lift the same, or it will be lifted at their expense. In cases where the mine boss or superintendent orders a greater thickness than 4 in. left, the company shall take care of it, and where the bottom left is sulphurous or unmarketable, the miners may call the attention of the mine boss to it and endeavor to arrive at an agreement for its removal or retention. In case of sprags being left by a machineman, he shall be notified by the loader, and if he refuses to remove them immediately, the loader shall do so and be allowed 50c. for so doing, said amount to be deducted from the machine runners. When any machine runner leaves 6 or more sprags in any one pay, he shall be removed from the machine and his services disposed of as deemed best by the superintendent of the mine.

Rule 10—The company shall provide shields for covering the cutter head of machines. The machineman shall be required to remove the bits from the chain cutter head, or place the shield over the cutter head to make the machine safe for removal. Any machineman failing to carry out this rule may be removed from the machine without question.

Rule 11—No strike or suspension of work except it be because of the failure of the employer to pay on the regular pay day shall take place at any time in this sub-district until the district miners' official and the operator have met and failed to adjust the dispute. But it is understood that the meeting of the official and the operator shall be held within one week from the date when the said meeting was requested by either party thereto.

Rule 12—All machine loaders shall be accorded two rooms for each two men, and the operators pledge themselves to provide two rooms for each two men at the earliest possible moment, but in the event of territory becoming scarce through a squeeze or by reason of striking a horse-back, or any other unavoidable obstacle, this shall not be construed so as to diminish the output of the mine.

Rule 13—Where a miner is required to make the height above the top of the rail 5 ft., $0.8776 per yard shall be paid for shooting and loading rock, 18 in. or less in thickness in three-run wide places and $0.9473 per yard shall be paid for this work in four-run wide places. Excess over 18 in. shall be paid for at the rate of 5c. per inch per yard.

Rule 14—All work 18 ft. wide and under 24 ft. shall be paid for at a rate of 2c. per yard over room price for loading; machine runners shall be paid narrow-work price, but when the company orders a place driven 24 ft. wide the pay of the cutter and loader shall be adjusted accordingly.

Rule 15—The company has the right to put two men in entries where isolated, to cut and load coal and move their own machines.

Rule 16—Daymen are to do whatever work about the mine the management may require, so long as they are paid scale price for the work.

Rule 17—A turn rail shall be laid in all break-throughs and rooms after the first cut of the machine is loaded out, except in room break-throughs; when desired by miner a turn rail shall be laid as soon as a cut is made, unless a second cut is unnecessary.

Rule 18—Entry loaders shall have two places to load from.

Rule 19—In case of local or general suspension of mining either at the expiration of this contract or otherwise, the engineers, firemen, pumpers and other men necessary to keep the mines in shape, shall not suspend work, but shall, when the mine is suspended, fully protect and keep in repair all the company's property under their care, and operate fans and pumps and lower and hoist such men or supplies as may be required to keep up steam at the company's coal plant; but it is understood and agreed that the operators will not ask them to hoist any coal produced by nonunion labor for sale on the market. The rates to be paid for such work are to be those in effect at the time of suspension, subject to any subsequent settlement.

Rule 20—When necessary to hold meetings at the mine and the miners so desire, one to four hours of one afternoon each month shall be allowed for the purpose of holding such meetings. Such afternoon shall be agreed upon between the management and the miners at the different mines. No other meetings than as herein provided shall be held at any mine during working hours.

Rule 21—Any new rules, local or general, other than contained in this agreement, governing the scale or conditions of employment in Sub-District No. 6 of Ohio shall be mutually agreed to by the operators and members interested, and said rules, before being enforced, shall receive the endorsement of the officials of the operators and those of District No. 6 of the United Mine Workers of America.

Rule 22—Where coal is lost owing to a fall or otherwise, through no fault of the miner, cutter or loader the company shall pay for work actually performed but in no case shall the said amount exceed the average wage received per day for the pay.

Rule 23—The regular pay day shall be on or before the tenth and twenty-fifth of each month. All pay shall be in legal currency. Employees shall receive a statement of their account on or before payday, the statements being retained by the employees.

Rule 24—Operators may require machine runners to cut on idle days in case of breakdowns or unavoidable accidents.

Rule 25—The mines of this district shall begin work at 7:00 a.m., working until 11:00 a.m., and beginning at 11:30 a.m. shall work until 3:30 p.m.

Rule 26—Where the company furnishes iron track instead of wood, the miners or loaders agree to lay it under the same conditions as the wooden track is now laid. Iron rails shall be furnished in lengths not to exceed 12 ft. and not more than 16 lb. to the yard. All rails, spikes and ties shall be delivered to the working-places in same manner as at the present time.

Rule 27—The miners agree to load out clean coal. In case bone coal, slate, sulphur or other impurities are sent out by a miner, it shall be the duty of the trimmers to call the attention of the weighman to that fact, who shall thereupon mark the record of the mine car on the daily weight sheet so that the miner may have due notice. For the second offense he shall be fined 50c. and for the third offense in six actual days' work, he shall be fined $2.50 or at the option of the mine boss may be suspended for three days. Should a miner or loader either willfully, carelessly, negligently or maliciously persist in loading impurities, he may be discharged. Should there be any question as to discrimination in the enforcement of this rule, it shall be taken up for settlement by the district officers of the United Mine Workers of America and the operator. The fines shall be paid by the company into the burial fund, and no fines shall be remitted.

Rule 28—The pushing price shall be 4c. per ton, to be deducted from the mining or loading price in either pick or machine mines where the company takes the load from the face of the working-place. Otherwise the miner or loader is to receive the empty at the room switch. Where necessary, on account of physical conditions, the company will assist the miner in placing the empty car at the face of the working-place.

Rule 29—Where in either pick or machine mines the company requires the entry or break-throughs between entries driven double shift, $0.3332 per yard extra shall be paid.

Rule 30—It is understood and agreed that under the mine-run system the coal shall be shot, gotten down and loaded in a workmanlike manner, that only clean, merchantable coal will be loaded, and that no excess of fine coal will be produced except that ordinarily made in the No. 6 Coshocton seam under a screened-coal system, this provision being in compliance with Section 978 of the General Code of Ohio. Should a loader willfully, carelessly or otherwise fail to load a clean, merchantable coal, and to prepare it for loading in the manner above set forth, he shall be notified and warned by the mine superintendent or foreman. If he then continues to load coal excessively fine as defined above, his case shall be investigated by the mine committee and the mine superintendent, and if found guilty he shall be suspended for three days, and for a further offense within 30 days his turn shall be stopped and the offense immediately investigated by the mine superintendent and mine committee, and in case they fail to agree upon the disposition of the same, his case shall be taken up by the general superintendent and district or subdistrict officials. If found guilty, he shall be suspended for two weeks, and in case he still persists in so doing his turn shall be stopped and he shall remain idle until a final disposition of his case is made by the superintendent and the officers of the United Mine Workers of America.

Retail Advertising in West

The Central Coal & Coke Co. has been indulging in quite an elaborate advertising campaign in Kansas City. Uptodate concrete and metal billboards, all electric lighted, have been installed by the company everywhere. Each board has a painting showing some feature of the company's service. The accompanying photograph is a board which shows the method of loading trucks by crane.

Concrete Electric-Lighted Billboard

The Central Coal & Coke Co. has received many comments on the neat and attractive appearance of the signs. Most of the boards are rented for only a few months in the year, but a few continue in service during the summer, the emphasis of continued appearance before the public being valuable.

Coal Situation in Brazil and Chile

Since the beginning of the European war, says Consul General A. L. M. Gottschalk, of Rio de Janeiro, in *Commerce Reports*, the scarcity of coal in Brazil has been so great and prices have risen to such an extent that there has been talk of converting a number of local coal-burning plants to use other fuel. The Central R.R. (government owned) is trying oil and has recently put into use 15 oil-burning locomotives; the Brazil R.R. (southern), it is said, now burns wood almost exclusively.

The coal used here has been principally Cardiff or Newcastle. It is said on reliable authority that a minimum of 107,780 metric tons (1 metric ton = 2204.6 lb.) of coal per month is consumed here, the chief consumers being the various foreign steamers, the local steamship lines, the railroads and the Brazilian navy. Present prices of coal are about $14.60 laid down in Rio de Janeiro, of which $8.76 to $9.73 is freight and marine insurance.

The following table shows the quantity, in metric tons of 2204.6 lb., and the value of the imports of coal into

Brazil from all countries and from the United States, and the coal imports at Rio de Janeiro during 1913 and 1914:

Years	Imports into Brazil				Imports into Rio de Janeiro	
	Total		From United States			
	Tons	Value	Tons	Value	Tons	Value
1913	2,262,347	$19,505,066	274,798	$2,162,098	1,293,346	$10,617,588
1914	1,540,126	10,347,085	260,594	1,815,806	900,332	5,911,903

It would seem advisable to keep a large quantity of American coal—say, 100,000 metric tons per month—on hand in Rio. Several American exporters might unite in sending this amount, or arrangements might be made to have several large dealers in Rio combine on a standing order for a specified amount of American coal per month for a term of months, which they would handle as their own speculation. It would be necessary for American coal dealers to make every possible concession in the matter of terms. Ample accommodation in the way of yards, coaling appliances, etc., could be had here by arrangement with some large local firm. (A list of coal importers of Rio de Janeiro may be obtained from the Bureau of Foreign and Domestic Commerce or its branch offices.) Credit ratings of Brazilian firms will be supplied by the National City Bank, of New York.

There is some preference shown here for English coal, not because of any particular superiority as to its steaming qualities, but because it is always sent here in regular-sized lumps (screened), which fit the grates in use in the country. Some people here make the objection to American coal that it is of greater friability than the British and breaks up during transportation; but this idea is probably due largely to the American system of shipping what is called run of mine, or unscreened coal, of non-uniform sizes.

Proposed Demands of Anthracite Miners

United Mine Workers' leaders have taken up the question of demands they propose to make on the anthracite operators at the expiration of the present contract next April, and have, according to report, agreed on the leading points.

The present agreement, made for a four-year term, expires on Apr. 1, 1916, which is Presidential year, and it has been said the miners' union would try to repeat the game it played so successfully on Mark Hanna in the McKinley campaign. At that time John Mitchell scared Mr. Hanna and the politicians into a hurried settlement which made important concessions to the miners. It is not likely an ulterior program of this kind will have any influence on the negotiations next year. Things are different in many respects.

The 1903-1906 and to an extent the 1909 agreements between the anthracite miners and operators were carried out fairly well by the men, but the agreement of 1912 has been violated by the miners almost continually. The last agreement was modified in some particulars at the instance of the miners to the detriment of themselves, operators and the anthracite industry.

Aside from this the men have not lived up to their agreement, and it has been plainly demonstrated that the leaders could not control them. Button strikes and all sorts of irregularities have occurred which have cost the men largely and the producing anthracite companies hundreds of thousands of dollars.

The miners' new demands include the old check-off proposition, before every conference since 1903, and always refused by the operators. The proposition, baldly, is that the operators shall collect the union dues from the miners out of their wages and pay it over to the leaders. The proposition is said to be illegal in this state, but besides this, the operators, who have always refused to recognize the union in any of the agreements of the last 12 years, do not propose to strengthen it by collecting dues out of miners' and laborers' wages. The other demands are an eight-hour day, an increase in wages and total abolition of the conciliation board.

Complete abolition of the board of conciliation would be a calamity. The effectiveness of the board was fully proved in 1903-1912, during which period it almost demonstrated the futility of the union as an agency between the operator and the miner. In 1912 the miners insisted that the board's power and prerogatives should be shorn and its efficiency has been less in the last three years than in the former 12 years since the mine commission award.

The operators will probably not take up the question of the new agreement until the early months of 1916. As a condition precedent to any negotiations they should insist that the body they deal with next year has the power to bind the miners to the new agreement, as well as the responsibilities which attach to parties who assume important contractual relations.—"Philadelphia News Bureau."

Recent Legal Decisions

West Virginia Wage-Payment Law Valid—The West Virginia statute which requires coal operators and other employers to redeem wage checks in cash is a valid regulation. (West Virginia Supreme Court of Appeals, Atkins vs. Gray Eagle Coal Co., 84 Southeastern Reporter 906.)

Places of Refuge in Indiana Coal-Mine Entries—In a suit against an Indiana coal operator for injury to a miner, based on breach of the operator's statutory duty to provide places of refuge in the side-walls of entries where only a single hauling track is maintained and there is not at least 3 ft. clear space between the sides of cars and the wall, it is not incumbent upon plaintiff to show that the operator had notice that the clearance space was less than 3 ft. or that it was practicable to provide places of refuge. It is a matter of affirmative defense to show the impracticability of making such provision. (Indiana Appellate Court, Vandalia Coal Co. vs. Coakley, 108 Northeastern Reporter 382).

Contributory Negligence of Injured Miner—The fact that there was danger in a miner remaining at work, on account of lack of props, does not necessarily bar his right to recover for injury received through falling of coal, unless the danger was so imminent that an ordinarily prudent miner would have refused to continue work in the same circumstances. Nor does an oral statement made by him after the accident, to the effect that he had been foolish in attempting to cut through the vein of the coal in its condition, necessarily preclude recovery, although the statement might be considered in determining whether he acted as a prudent man would have acted. (Kansas City Court of Appeals, Runyan vs. Marceline Coal & Mining Co., 172 Southwestern Reporter 1165.)

Loyalty

By Michael Bernard

Its value, at the very best,
In some small measure may be guessed,
But never certainly expressed
Behind the dollar sign.
Still, while it seems to mean so much,
It's not a thing that one can touch,
Like timbers, engines, rails and such
Equipment for the mine.

Although so subtle and unseen,
It marks the difference between
The living man and the machine,
The worker and the cheat;
And oftentimes this simple thing
May cause the balance beam to swing
From failure to success and wring
A triumph from defeat.

It's vain to strive to dam the tide,
And doubly vain to try to hide
This blend of honesty and pride
When it has shown its face;
For observation clearly shows
That everywhere its spirit goes
The workers strike with harder blows
And set a swifter pace.

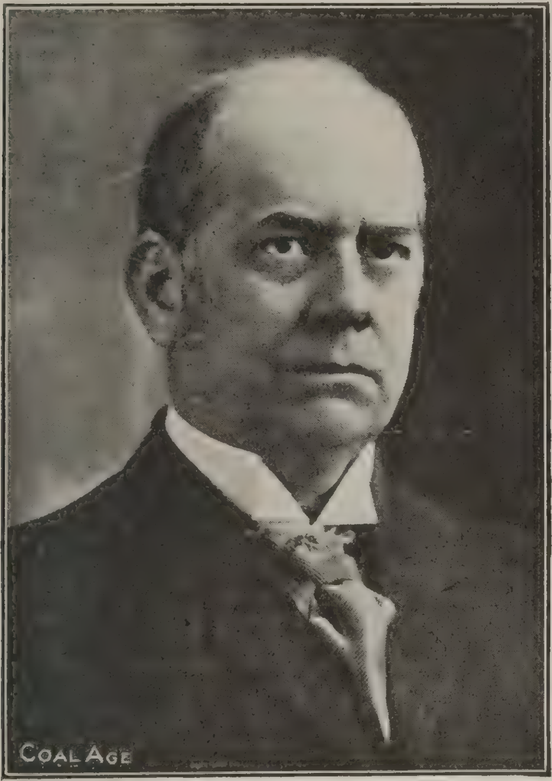
Although with such importance fraught
And everywhere so widely sought,
It's something that can not be bought
By gold or hope of gain;
Instead, it wields its power where
Employers' dealings all are square,
Where every rule is just and fair
And every act is plain.

Who's Who in Coal Mining

Edward W. Parker

It is doubtful if any man in the United States engaged directly or indirectly in coal mining has a wider acquaintance in the fuel industries than Edward W. Parker, for many years chief statistician of the U. S. Geological Survey. For this reason it is a matter of interest to his wide circle of friends that he has resigned as chief of the Division of Mineral Resources to accept a position in the employ of the anthracite coal companies, where he will establish a bureau of statistics to carry on a line of work similar to that which he has done for the U. S. Geological Survey.

At this time when Mr. Parker is leaving the government's service to turn his attention to important work on behalf of the anthracite industry, a brief sketch of his earlier activities is of timely interest. He will be 55 years old on June 16, having been born at Port Deposit, Md., in 1860. His early education was obtained in the public and private schools of his native town. Later he attended the City College of Baltimore.



DR. E. W. PARKER, STATISTICIAN
U. S. GEOLOGICAL SURVEY

His first business experience was obtained as accountant in Baltimore. From 1885 to 1889 he was business manager of the *Statesman*, a paper published in Austin, Tex. It was during this time that Mr. Parker secured his first experience in editorial work. In November, 1889, he was appointed to the Eleventh Census, and in 1891 became statistician of the U. S. Geological Survey. In 1907 he was advanced to the important office of chief of the Division of Mineral Resources, which post he has held up to the present time.

Mr. Parker is descended from old English stock, his ancestors on both sides having settled in America in the early colonial days. His mother was Henrietta Hyde Donnell, a descendant of William Hyde, of England, who came to America in 1633, settling in Hartford, Conn. Mr. Parker's father was the grandson of Edward Parker, a colonel of militia in the Revolutionary War.

Mr. Parker is a member of the Cosmos and Chevy Chase Clubs of Washington and the Engineers' Club of New York City. He is also a member of the American Institute of Mining Engineers, Mining and Metallurgical Society of America, Washington Geological Society, National Society of the Fine Arts, Washington Society of Engineers, Sons of the American Revolution and is Treasurer of the Washington Academy of Science.

Along literary lines Mr. Parker's efforts have been quite extensive; his most important work includes contributions to the Geological Survey reports, "Mineral Resources of the United States" and to the Eleventh and Twelfth Censuses. He has in preparation a history of the mining industry of the United States, a volume which is being prepared for the department of economics and sociology of the Carnegie Institute.

In his new field of labor Mr. Parker's attention will be devoted to the organization and operation of an information and publicity bureau for the hard-coal companies. The good wishes of his host of friends throughout the American mining field go with him in his new work, and we are all predicting that the American people as a whole will know more about the anthracite industry in the future than they ever did in the past.

⁂

The Establishment of Standards in Coal Mines

By F. L. Parker*

In order to secure a basis for the establishment of standards in coal mines, an accurate, definite and clear report of work done by miners, repairmen, drivers, etc., for 10 consecutive shifts was obtained. Good, reliable and intelligent men were chosen for these tests, and where this was impossible the report was made by an engineer thoroughly acquainted with the work. From the time the men went underground until they came to the surface at the completion of their shift, all time spent was accounted for, whether it was drilling a hole, loading a car, standing timber, waiting on the driver or deliberately wasted. For every task reported on, a definite statement of conditions was made, otherwise the record would have been worthless.

In this way standards for every task performed by the underground workers were established, and these standards have been found indispensable in determining an employee's value and his consequent compensation.

Suppose for instance a certain gangway is not progressing as rapidly in the pittboss' estimation as he thinks it should. By referring to the chart of standards he is able to tell at once whether the fault lies with the miner or is due to abnormal conditions. In either case the trouble should be eliminated, and the result would be entirely fair to both miner and boss.

By employing standards the superintendent will do much toward harmonizing the laboring element and increasing the general efficiency of the employees.

*Glen Carbon, Penn.

The Labor Situation

SYNOPSIS—The protocol has now been drawn for the ending of the strife in eastern Ohio, and the miners have already ratified it. This will end the last of the labor controversies, but after 11 months the strife will begin again and involve both the anthracite and bituminous regions. A strike has been proposed to save Lawson, the Colorado agitator, from the penitentiary.

After several weeks of parleying and discussions of all phases of the situation, the joint committee of operators and miners in the eastern Ohio district agreed on a wage scale at Cleveland late on Saturday, May 8. All the disputed points were settled, and a committee was left in charge to reduce the scale to writing for presentation to the miners at the district convenion to be called at Wheeling, W. Va., on May 11. This committee has ratified the scale as presented to them, and the representatives of miners will now meet the operators at Cleveland, Ohio, so that the agreement can be signed.

This ends the strike, which has lasted for more than 13 months. During that time a number of conferences were held and joint committees on the scale were named, but they never approached an understanding, always adjourning with the dispute unsettled. Governor Willis is given much credit for the successful ending of the strike, for it was through his efforts that the first meeting of the present series—that held at Canton—was called. He made a speech urging on both sides the necessity of arriving at an understanding, and thereafter the scale was discussed by both parties in a different spirit than that which had animated them at any of the previous meetings.

Miners Get Major Demand, but Surrender Several Hampering Provisions

The scale provides for a rate of 47c. per ton for cutting and loading coal This is the same as that paid in the Hocking Valley and other Ohio districts and is the rate which the miners have been demanding. Eastern Ohio operators have been refusing that scale because of their inability to compete with Pittsburgh corporations that are paying 44.61c. But reductions made on "dead work" granted by the miners almost counterbalance that difference, and the operators believe that they will now be able to compete with the Pittsburgh district.

Following are some other details of the scale: The cutting rate will be 8c. per ton and the loading 39c. Reductions have been made on all kinds of "dead work." The day-work wage scale remains the same as it was in the previous agreement. Machine-men agree to reset three posts without charge and are awarded 5c. apiece for all additional posts reset.

Rooms Are to Be Narrow so that Pillars Can Be Drawn.

Rooms are reduced in width from 24 to 18 ft. The operators desired a 16-ft. room, the best results being obtained with one only 12 ft. wide; but the miners succeeded in demanding that the size be 18 ft. The operators are hopeful that they can now recover all the coal, abandoning their practice of leaving the pillars to be crushed.

The miners urged that narrow rooms would increase the percentage of slack and defeat another aim of the operators, which is to make a maximum of lump coal. This argument overlooks the fact that the operators intend to leave large pillars which when drawn will give a large amount of coal of the most merchantable size. This pillar coal could not be obtained when rooms were driven as wide as has been customary.

Entry cutting is compensated by an additional payment of 5c. per yd. Double-shift work has been reduced from 31 to 25c. per yd. Entry yardage is now 30c. under the new scale. Entries are to be 15 ft. in width, but when driven wider less yardage is to be paid. This is an important concession from the old rule under which yardage was paid in all work less than 24 ft. wide. Engineers can belong to the union or refuse to be affiliated with it at their pleasure.

The scale is to extend to Mar. 31, 1916. Operators made an effort to have it extended to Mar. 31, 1918, but were unsuccessful. Provisions were included in the scale which practically insure the mining of clean coal and which will also tend to make as large a proportion of lump as possible.

Cost to Miners' Union Was About $1,400,000

Secretary-Treasurer Green of the Mine Workers said: "This agreement brings to an end a strike that in many respects is most remarkable. For almost 14 months more than 12,000 miners have been engaged in a most intense industrial struggle. Altogether, counting the miners and their families, more than 60,000 men, women and children have been directly involved. During all that time not a single violation of law has taken place nor has one dollar's worth of property been destroyed. As secretary-treasurer of the International Union I have sent $1,004,500 in weekly installments for the purpose of feeding, clothing and caring for these thousands of striking miners and their families. In addition the district organization has supplied approximately $400,000. From outside sources another $100,000 has been supplied, which makes in all $1,504,500."

One of the important points in the agreement is a penalty for unwarranted strikes or unjust lockouts. Heretofore operators have had no redress when the miners struck, even if the strike was unwarranted. This has been changed in the new scale.

Gallagher Bill Passed by House Goes to the Governor

Much to the surprise of everyone, the Gallagher bill was finally passed by the Ohio House of Representatives by 64 to 51, the Cincinnati delegation shifting its vote and making the result possible. Governor Frank B. Willis was against its passage, and it was thought on May 6, when the vote had resulted in its favor, that its approval by the House would make impossible a settlement of the strike. But it didn't prevent the protocol being completed.

Industrial War Declared Every Two Years

It is important to point out that this settlement marks the end of the labor troubles at present. Peace is assured for 11 months. After that time we start another series of strikes, both the anthracite and bituminous regions being involved. Our present rule is a war every two years. The industrial pacifists have a task here worthy of all their skill.

Not a Breach of Law to Discharge a Man for Unionism

The Ohio Supreme Court decided on May 4 that the law which prohibits the discharge of an employee for belonging to a labor union is unconstitutional and therefore void. It was questioned in court whether the law conflicted with the United States Constitution, and the Supreme Court in a similar case decided that it did.

The majority opinion was held by Chief Justice Nichols and Judges Jones, Newman and Mathias. Judges Wanamaker and Donahue dissented from this decision. The majority said that the Ohio court's hands were tied, as the ruling Federal Supreme Court made any lower court's action of no importance.

Officials Threaten a Strike to Cause Release of Lawson

Last week it was stated in this department that John Lawson, executive board member of the United Mine Workers of America for district No. 15, had been convicted of the murder of John Nimmo and sentenced to life-imprisonment, that official having been in charge of the miners during the fighting when Nimmo was killed. There is a threat to start a strike to secure his liberation.

Seeing that it is well known that Lawson was trying, and nearly succeeded, in making the position of the men who are now working in Colorado nonunion mines unsafe and unendurable, it is hardly likely they will quit work to save him from his own actions. Those who are in the unions and in other camps might strike, but the action will only assist those whom the union has tried to injure. So the strike is likely to die a-borning.

President Declines to Give Up Governor Ammons' Letter

Joseph P. Tumulty, the President's secretary, has refused to furnish the United States Commission on Industrial Relations the letter from Governor Ammons to the President relative to the Colorado miners' strike. This was requested by Basil M. Manley, a field agent of the commission.

It is clearly the duty of the President to surrender this letter, which is a public document on internal affairs. Demand for it may be made just as rightly as for the private letters of John D. Rockefeller, Jr., to the officials of the Colorado Fuel & Iron Co. The President takes a remarkable and wholly unjustified stand. At the same time it must be confessed that it is refreshing to see him rebuke by his action the unwarranted use that Frank P. Walsh has made of documents put in his hands. Mr. Wilson has shown again that while he is an autocrat, somewhat disposed to overestimate his rights and duties, he is nevertheless thoroughly conscientious in his attitude to public questions.

Editorials

Steel Activity and the Coke Trade

The revival in iron-trade activity has reached such a point that some interesting developments in the coke trade may soon occur. So many uncertain factors enter that it is not known whether enough coke could be made, upon occasion, to supply all the blast furnaces. It is a long time since the iron trade and its related branches had an opportunity to operate at capacity. The condition was approximated in the winter of 1909-10 and again three years later, but even at that only for short periods. The last time that the industry operated beyond question at its full physical capacity was in 1906 and the first nine or ten months of 1907. Iron and steel prices were then high, but the prices paid for Connellsville coke, $2.50 to $3, were by no means proportionate.

In 1906 and 1907 the production of byproduct coke averaged 5,000,000 tons a year. The present capacity is fully 10,000,000 tons greater. Meanwhile the blast-furnace capacity of the country has increased about 8,000,000 tons, requiring approximately 8,000,000 tons more coke a year to operate at capacity. That might suggest 2,000,000 tons of coke to spare, but the beehive capacity has not been kept up. The U. S. Geological Survey recently reported a few more beehive ovens in serviceable condition in 1913 than in 1907, but the maximum number fell in an intermediate year, 1910, since when there has been a constant decrease. From time to time in the Connellsville region the coal is worked out, to coke which certain ovens were built, but the ovens remain available only in case such high prices can be obtained for coke as to warrant the shipping of coal from other workings to the ovens.

There is some reason to suspect that the building of byproduct coking plants has lagged behind the erection of blast furnaces. There are scarcely any blast furnaces being built, but many retort ovens are being erected. The Youngstown Sheet & Tube Co. let a contract for 204 retort ovens only a week or two ago, though its blast furnaces have been built many years.

If the coking capacity has not increased largely at the close of the next two years, when all the byproduct-oven erection now on the boards is completed, and if the blast furnaces attempt to operate full, there will be a decided shortage of coke. The pig-iron production is now at the rate of 26,300,000 tons a year, the estimated commercial capacity being about 36,000,000 tons, while the nominal rated capacity, including unfit stacks, is well above 40,000,000 tons.

The Connellsville and lower Connellsville coke regions have increased their shipments from about 200,000 tons a week at the beginning of the year to approximately 300,000 tons a week of late, and the 50 per cent. increase has been attended by no stiffening whatever in the currently quoted prices. There is simply less coke left in the market and the price is unchanged. Perhaps if the region were called upon to ship 50,000 or 75,000 tons a week in addition to the 100,000-ton increase already experienced prices would begin to jump. Such a prediction is made in some quarters. The labor supply, it is said, is quite insufficient to operate the existing ovens at capacity.

⁂

Our Coal Exports

The far-reaching influences of the war, together with the persistent efforts of some of our large coal companies, are at last having their inevitable effect upon our export coal trade.

At the beginning of the war, it seemed as if the inactivity of business was to be stimulated by the demands from foreign countries; inquiries for large amounts of coal poured in, while ten or twelve of our selling companies sent men abroad and to South America to investigate the situation and arrange for subsequent sales.

As an immediate result, our coal exports increased quite rapidly for the first three months of the war, only to meet eventually with several large-sized stumbling blocks in the way of credits, lack of banking facilities, resumption of British coal exports, an unprecedented rise in ocean freights and a decreased consumption in foreign countries, owing partly to the effects of the war and partly to enforced economies in consumption.

Now, however, it seems as if we had actually begun a steady increase in our coal exports and that our coals were about to take their rightful place in the world's markets.

Our coal-selling agencies have at last shown some signs of understanding the methods of foreign purchase and usage, banking facilities have been furnished, our coals have been tested and proved, while the stocks of coal in foreign countries have diminished and industries have been stimulated to some extent. Ocean freights are somewhat easier, the entrance of coasting schooners and steam colliers into oversea trade has added to the available tonnage, while the increase in price of British steam and gas coals, from 75 to 100 per cent., has been an additional factor.

The opening of an office in New York by the Italian state railways and the actual purchase of a large block of tonnage by the Italian government for marine and shore use have given an added stimulus to our export business.

At least one large contract is practically made with French buyers, while there has been a steady and increasing flow of coal to the east coast of South America.

Gas-coal users are also looking to the United States for their fuel; considerable coal of this description has already gone to the east coast of South America, and now the Chilean gas companies are making inquiries. At least one trial shipment of Pennsylvania coal has been arranged for to compete with Australian coal—a difficult matter, as the latter is an extremely satisfactory fuel for this use.

The following figures (Canada excluded) will show the fluctuations in our coal exports since the beginning of the war:

EXPORTS OF AMERICAN COAL

1914	
July	334,128
August	442,080
September	654,590
October	372,336
November	329,890
December	267,769
1915	
January	268,935
February	282,294
March (Baltimore, Philadelphia, Hampton Roads)	405,437

For April, the Philadelphia figures are not yet available; the Baltimore exports were 193,293 tons, while at Hampton Roads the exports for 28 days were 365,534 tons, or a total of 558,827 tons.

It cannot be too often repeated that we must own or control ocean transportation facilities if we are to increase our coal exports on a large scale. The markets are there; we have the coal; we must also have the means of getting the coal to the markets at a sufficiently low cost.

A step in the right direction has already been made by one of our large selling agencies in forming a permanent combination with certain large British coal and steamship owning interests, while two or three other of our companies are having colliers built for the foreign trade. But we must do more—we must show our confidence in foreign countries and their enterprises by money investments that will give us needed influence and prove that we are in the export business permanently.

Coastwise Contracts

The placing of a large power-house contract in November at a price understood to net $2.70 f.o.b. for an 18-month period foreshadowed the dullness and the low range of prices that have prevailed this spring in the coastwise coal trade. The lack of any consistent policy among the operators during 1914, particularly in the Pocahontas and New River fields, clearly indicated another off-year unless something radical would take place.

A sharp advance in coastwise freights the latter part of January did give a snap to the market, but when it was realized that once the weather cleared there would be enough bottoms for all the business offering, the flurry ended. Rates remained on a $1 basis, Hampton Roads to Boston, for several weeks, and during that time it was practically impossible to secure transportation at anything like a competitive rate for the season.

As a result the shippers who had little or no transportation under control could do nothing but bear the market and advise their customers to withhold purchases for the contract year until conditions settled down. On the other hand, the shippers who did control transportation urged buying, and in order to encourage it they discounted current freights quite liberally, but still made their season delivered prices 10@15c. up from the 1914 level.

As a consequence, the contract season in New England this year falls into two parts—the January-February period, when contracts generally were on a higher basis than a year ago, and the period since, when freight sagged to the normal basis of 75@80c.—and contracts have been either on the same basis as last year or somewhat less.

The award of the Panama R.R. contracts on a $2.70 basis really blazed the way, but it was not until February when the lowest bid on the Portsmouth, N. H., navy yard contract (No. 89) was $3.65, and later still when the Charlestown, Mass., navy yard supply (No. 79) was placed at $3.49 alongside, that it became apparent this would be another dull year with prices weak and fluctuating.

Any analysis of contracts placed since February, especially on the really comprehensive orders, shows a base price from 5c.@10c. less than last year. In April, 1914, although trade was dull, Hampton Roads standard coals were rather firmly held at not less than $2.80 f.o.b. There was a pessimistic undertone, yet until June prices were reasonably well maintained. There was evident on the part of operators a disposition to get their price or keep coal in the ground. This spring, however, there is greater effort to sell and correspondingly more diffidence on the part of buyers. Business conditions show very little improvement, and purchasing agents are inclined to scoff at any attempt to renew last year's prices.

The Boston Elevated Ry. (No. 528) is understood to have bought late in March at least 5c. less than last year, and so in the case of the Central New England Ry. The former buys f.o.b. loading port and the latter f.o.b. the mine, and for that reason they are perhaps not so significant, but the American Printing Co., Fall River, notwithstanding a higher freight market, is understood to have bought delivered on the same basis as in 1914. Instances could be multiplied where this has been the case on reasonably large orders, although on smaller business, where requirements for regular and frequent shipments are not so pressing delivered prices have lately been 10c. or so less than last year. The textile mills generally, particularly those that use Pocahontas and New River coals, have been able to close at 5c.@10c. less.

The City of Boston, for its harbor institutions, has been trying hard to secure an acceptable price. The order (No. 461) is for 40,000 tons, and already bids have been twice called for and twice rejected. Last year a part of this contract was awarded at $3.47 alongside, and the lowest price thus far this year on New River or Pocahontas is $3.67. The contract is now about to be advertised a third time. This, it should be said, is practically all for points that are on too shoal water for larger barges.

Local contracts, for delivery by team in Boston, have been much lower than last year. Prices on such business as the Boston postoffice (No. 437) and the Boston schools (No. 566) are due only in part to conditions at wholesale. The main reason is an unhealthy rivalry between dealers.

In summary, season prices are lower than last year. Whether a low range will continue depends largely on the export trade. If that develops as many think it will, there may well be a stronger tone to the market. The bulk of the year's business is placed, however, and operators will still have to look to "another year" for better returns, at least from the coastwise trade.

Coal Preparation

The June 5 issue of Coal Age will be devoted almost entirely to the subject of coal preparation. We want to make this particular number a really interesting and valuable compilation of engineering facts relative to this interesting and important phase of coal mining. All of our readers, therefore, are invited to submit articles on the preparation of coal and especially describe successful installations with which they are acquainted. Both anthracite and bituminous practices will be discussed.

Republic Iron & Steel Co. Meet

The front cover shows two views of the Republic Iron & Steel Co.'s first-aid meet held at Republic, Jefferson County, Ala., on Mar. 27, 1915. The contesting teams were from the mining towns of Palos, Republic and Sayreton, all of which belong to the Republic Iron & Steel Co.

Officials at Palos Meet of Republic Iron & Steel Co., Sayreton, Ala.

From left to right, in rear—Dr. W. H. Godwin, physician and first-aid trainer, Warner division; R. C. Wynn, superintendent, Warner division; C. T. Fairbairn, manager, Southern district, Republic Iron & Steel Co.; F. G. Morris, general superintendent of coal mines, Southern district; W. T. Burgess, foreman of rescue work, United States Bureau of Mines; W. W. Kicker, superintendent, Palos division; J. G. Meagher, superintendent, Sayreton division; Dr. J. S. Norton, physician and first-aid trainer, Sayreton division; Dr. John W. Snow, physician and first-aid trainer, Palos division. From left to right, in front—R. E. Butler, engineer of coal mines; J. H. Lloyd, mine foreman No. 2 mine, Warner division; A. H. Verchot, mine foreman, Warner division; George Burgess, mine foreman, Palos division; Frank Ferguson, mine foreman, Sayreton division.

Palos had 4 teams of 5 adults, and the boys also had a team of the same size. Republic had 13 teams, of which 9 were of men, 1 of boys and 3 of women. Thus there were in all 90 contestants. There were nearly 1500 people on the grounds, the weather being most favorable for the event. A big barbecue dinner was served on a table 200 ft. long, the meat having been barbecued all through the previous night.

The Palos team carried off the honors. The women's teams acquitted themselves with great credit. First-aid work is spreading rapidly in Alabama, not only at the mines, but on the railroads and at the public schools. There are three oxygen-apparatus teams at Sayreton, two at Republic and one at Palos.

For four years the Republic Iron & Steel Co. has been training first-aid teams. It awards a gold-plated button or pin to all the men, women or children who show the desired proficiency. At intervals of two weeks a free motion-picture show is given in the first-aid hall of every mine village.

Mining Village Churches of the Colorado Fuel & Iron Co.

In the mining camps of the West little progress has been made in developing the needed religious restraints. Unfortunately the nationalities are so numerous and the desires of the people in this matter so variant that it is hard to provide for everyone, whereas in the matter of

Guild Hall at Crested Butte, Colo.

schools where all are collaborating and contributing the work is far more easy.

However, the need is not inconsiderable even economically, for there is no discontent which is so certain to bear good fruit physically, mentally and morally than discontent with oneself. This is or should be the work of the church. All political and labor movements are for the reform of other people, to make others perform certain acts which we believe will help *us*. Religious movements are, on the other hand, personal. The reformation sought is not a violent external restraint of the individual, but an increase of his own personal control.

Church at Fierro, N. M.

Church at Sunrise, Wyo.

No mining camp can therefore expect to do its bargaining, individual or collective, unless its members have been impressed with their need for such constraint, which makes the operator less autocratic and the workman less unfairly self-assertive. In fact, the relation religion bears to politics and industry is most vital as it provides the material of citizenship out of which is derived a right-thinking electorate and an intelligent, industrious and frugal personnel, without which both state and commerce must come to a disastrous end.

Where else can be taught the rules of moral accountability, fairness of judgment, the recognition of others' rights, the reciprocal duties of employers and employees, of parents and children, of the governing and the governed, of tradesmen and customers? Sometimes, of course, other purposes than these get the upper hand, and the churches seek to be political and industrial rather than to prepare the material out of which the best-governed state and a well-ordered industry will proceed; and the result is not all that it should be. But the attempt to do without such restraints entails more damage than can ever rise from a misapplication of the purposes of religion.

The Colorado Fuel & Iron Co. has erected several churches at its camps, of which a few are here illustrated.

Discussion By Readers

Mining Laws and Legislation

Letter No. 3—Referring to the interesting point brought out in Ostel Bullock's letter, Coal Age, Apr. 10, p. 650, in regard to the legal irresponsibility of the mine superintendent, in contrast with the burden of responsibility imposed by law on the mine foreman, permit me to say that although the operators of Pennsylvania coal mines are not legally responsible for any injuries sustained by miners through negligence in respect to the manner in which a mine foreman performs his statutory duties, yet if any condition affecting the safety of employees is brought to the attention of the mine owner or the superintendent he is legally bound to take proper steps to correct it promptly.

This is the view taken recently by the Court of Common Pleas of Fayette County, Pennsylvania, in the case of Price vs. Etna-Connellsville Coke Co., 42 Pennsylvania County Court Reports, 664—a suit in which plaintiff recovered damages for injury to himself while bringing loaded cars out of a mine. The case was argued on the theory of negligence of the company in permitting a pile of slate and gob to remain between the track and a rib and maintaining insufficient clearance.

Art. 20, rule 3, of the Pennsylvania bituminous mining act of May 15, 1893, under which this case was tried, makes it the duty of the mine foreman to "see that the entries at places where road grades necessitate sprags or brakes to be applied or removed shall have a clear level width of not less than two and a half feet between the side of the car and the rib, to allow the driver to pass his trip safely and keep clear of the cars there."

Under this rule the court held that the defendant company would not have been liable to plaintiff, except for the fact that it was chargeable with the knowledge that the mine foreman had negligently failed to observe the requirements of the rule. And since the duty to maintain sufficient clearance was statutory, it was decided that plaintiff could not be deemed to have assumed the risk of being injured on account of the dangerous condition, although he may have known of its existence.

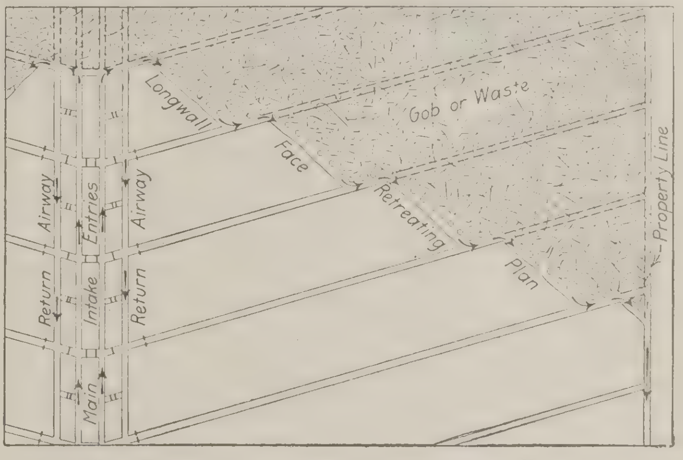
Longwall in Pittsburgh Seam

Letter No. 7—I was much interested in reading the letter of O. P. Rator, in reference to this subject, Coal Age, Apr. 17, p. 692, and to observe that he has the same opinion as myself in regard to the longwall advancing system not being adapted to the working of the coal in this seam.

I have been studying this question for some time, and have failed to see how it will be possible to prevent the occurrence of a squeeze on the haulage road if the advancing system is to be adopted. I am convinced that this could only be done by building cribs about 6 ft. apart and filling these in with rock that could probably be obtained in sufficient quantity from the brushing of the roof on the roadways and from nearby falls. However, I concluded some time ago that it is needless to consider further the advancing plan for working the coal in this seam. I am satisfied that no one who has had experience in the working of the Pittsburgh seam would attempt to mine the coal by the longwall advancing method, except possibly someone who has more money than brains.

I would like to explain briefly my idea of working this seam of coal on the retreating plan. I will confess at the start, however, that the plan has the disadvantage of not yielding a large output of coal until the boundary line of the property has been reached and the longwall face developed. I believe that there would be a benefit derived by the adoption of this plan in the long run. I realize fully that the expense of laying out the plant and installing the necessary machinery would mean a considerable investment at the start, but much of this preliminary work could be postponed and the expense curtailed until the mine reached a paying basis, when the improvement could be made in the equipment. The coal mined from the entries, in the advancing system, would help to meet the expense.



Proposed Longwall-Retreating Plan

In regard to the plan I have mentioned and attempted to illustrate in the accompanying figure, I would drive the main entries four abreast on the face of the coal. The two center entries should be made the intake and haulage roads for the two sides of the mine, while the entries on each side of these would serve as the return air-courses for the same. If the mine is opened by a shaft, these main entries should be driven in both directions from the shaft bottom. The main entries should be driven 9 ft. wide, and cross-headings turned at an angle of about 25 or 30 deg. with the face cleats on each side, as shown in the plan. These cross-entries should be driven at such distances apart as to afford a working-face of about 100 to 150 ft. in length. When these cross-entries have been driven to the property line, a heading should be driven along the line and the working-face opened up at the far inby corner.

The line of working-face should be stepped, as shown in the plan. The purpose of this is to reduce as far as possible the liability to a squeeze occurring as the work advances and to provide at the same time a steady settlement of the roof as the face recedes from the boundary line. The old broken posts may be used for the building of cribs, which should be spaced about 20 ft. apart, along the rear face to prevent the roof from swinging the timbers toward the face. I hope this plan will be clear as I have explained it.

JOHN OLDROYD.

Firing Shots in Mines

Letter No. 2—Some time since there was published in COAL AGE (Vol. 6, p. 665) a description of a chemical fuse igniter, which, it was explained, had been invented for the purpose of firing shots "in mines generating gas and in dusty mines where the coal is highly inflammable." To the article was appended a note by the editor suggesting the discussion of the question, "Is the idea practicable?"

Thus far I have only seen one letter referring to this matter. I want to say most emphatically that, in my opinion, the idea is wholly impracticable and cannot be safely applied to the blasting of coal under any conditions. Indeed, were I in a position of authority, as mine inspector, superintendent, foreman or other official, I would not hesitate to debar such practice from any mine in my charge.

In my opinion, the use of black powder should be entirely eliminated from *all* coal mines generating gas, but especially dusty mines where the coal is highly inflammable. I am convinced that only permissible explosives and the most approved system of electric shotfiring should be permitted in such mines, and in order to insure the safe and successful operation of the mine, I believe particular attention should be paid to the following points:

1. The wire conductors should be so installed as to insure absolute freedom from accidental connection and premature explosion.
2. The system should be protected against stray electric currents from any source.
3. The system should be protected against a possible grounding of the current that would render ineffective the firing of the shots.
4. The system should be protected against any possible short-circuiting of the current for the same reason.
5. The proper voltage required to insure the firing of all the shots should be carefully determined.

Referring again to the suggestion of a chemical fuse igniter, I would say that such a method is open to the same objection as other methods of firing shots by means of fuse. Any imperfection of the fuse or any injury to the same caused in tamping the hole might make the shot hang fire. In addition to this the method suggested presents another risk due to a possible slight difference in the composition or thickness of the celluloid diaphragm, which may indefinitely delay the ignition of the charge. These risks are entirely eliminated in the use of an electric shotfiring system.

Referring to the suggestion made in this article, in regard to the danger of the powder becoming damp in the hole before the fuse is ignited, owing to the wrappings of the charge being broken by a rough and jagged drill hole, it occurs to me that is possible in any system of firing. He suggests that it should be prevented by the use of a drill that will bore a comparatively smooth hole. In practice, however, this is not always possible.

In my experience, the charge of powder should be incased in double wrappings, one of which is waterproof. Such wrappings are commonly used in the anthracite region of Pennsylvania and are called "bologna paper." By soaping the outside of the wrapper or greasing it with axle grease the danger is greatly reduced, but it cannot be expected that the charge will remain absolutely dry for a considerable length of time, such as might result from the delayed ignition of the charge.

In discussing this question, the suggestion is made, COAL AGE, Vol. 6, p. 996, that the possible delayed ignition of a charge would give an opportunity for the accumulation of a dangerous quantity of gas in the place and that this would be ignited by the blast. This objection, however, does not apply alone to the firing of shots by the chemical fuse igniter. The same condition may arise in electric shotfiring when a considerable period of time is allowed to elapse between the examination of the place for gas and the firing of the shots therein. Shotfiring in mines is surrounded by danger under the best conditions, and it should be the constant endeavor to reduce the risks in blasting instead of introducing new ones.

General Contractor.

Windham, Mont.

Liquor Question in Mining

Letter No. 3—I believe the liquor question as it pertains to the coal miner should be carefully studied from a moral, economical and psychological standpoint, instead of viewing it wholly in respect to its prevalence.

The consumption of alcoholic beverages is undoubtedly amazingly large among coal miners—inadequately large in proportion to their means for its indulgence. In any case, the indulgence of this habit impairs the mental, moral and physical well being of the individual. My study and investigation lead me to the conclusion that the prevalence of this evil among miners can be attributed mainly to three causes, which may be briefly described as follows:

1. The majority of those who indulge the drink habit to a greater or less extent firmly believe that its use is a material benefit stimulating and reviving the exhausted physical system after an arduous day's toil. They believe that it tones the nervous system, restores the muscular energies and invites a good night's rest in preparation for the labor of the coming day. Repeated inquiries in this regard reveal the fact that those who indulge to a moderate extent only are thoroughly convinced that over-indulgence is harmful and not to be tolerated.

2. Coal-mining camps as a rule are lacking in many needed attractions for the purpose of improvement, recreation and amusement. One of the strongest characteristics of human kind is to seek companionship and association with kindred spirits. Much as it is to be regretted, the saloon or hotel offers more conveniences and imposes less restriction on those who avail themselves of their privileges than could be found elsewhere. The convivial meetings that naturally result from these conditions invite the social glass with all its attendant evils.

3. The last and perhaps the least of the causes for indulgence is the desperation of overwhelming grief, anxiety and care. The nervous system is strung to the highest pitch by the continuous strain of the depressing conditions incident to coal mining. Some nervous temperaments require a stimulant to prevent a nervous breakdown, and these are the ones that are most liable to gravitate to the state of habitual drunkards as a result of over-indulgence. Such are often heartlessly condemned without due consideration being given to the causes that led to their downfall.

It is a recognized physical law that undue stress is always followed by extreme depression. Men of *nervous* temperament are most subject to this law. They devote their entire physical energy to the performance of what they undertake. Present welfare is ignored in the accomplishment of a desired end, which too often results in a physical breakdown followed by an irresistible craving for a stimulant. Coal mining, however, has a greater tendency to produce a *lymphatic* rather than a nervous temperament. Consequently, the average coal miner lacks the physical energy required to withstand the temptations to over-indulgence that are on every hand. The results are too well known to need description. It is useless to *preach* to these men; what they need is *health, better surroundings* and *attractive conditions* that will stimulate ambition.

To overcome the evils of the first cause mentioned, education is necessary—moral and physical. While men in this class realize the evil of over-indulgence, they do not grasp the fact that moderate indulgence saps the powers and impairs the efficiency of the human system. How such education is to be brought about is probably one of the most difficult problems in mining today. I have more hope along this line in the proper education of the young in our public schools.

In respect to the second cause mentioned, experience teaches that much good can be accomplished by the establishment in our mining camps of reading rooms, playgrounds and suitable places of amusement. These alone can effect the social uplift that is desired and provide the necessary association that is the craving of human nature, away from the harmful surroundings of the saloon and hotels. Much has been accomplished along this line by the Young Men's Christian Association, and the establishment of a branch of this organization in every mining camp would be of the greatest value to the coal-mining industry.

In a few instances, it has been argued by the management of coal mines that the entire elimination of the saloon from the mining camp would seriously handicap the operation of the mines, inasmuch as miners will have their booze. As a result, many coal miners seek those places where the saloon is permitted. While there is some logic in this argument, it must be acknowledged that the evil could be overcome by greater coöperation on the part of the management of different mines.

If coal companies, recognizing the unquestioned advantage to the industry, would unite their efforts to eliminate the saloon and the sale or shipment of intoxicating liquors in mining towns or camps, there would be no question of the success of the undertaking. If it is argued that this would be a restriction of personal rights and privileges at variance with the constitution, it should be remembered that personal rights and privileges are limited when they abridge the right or impair the best interests of the community, of which the individual is a part.

⁂

The Miner and Safety

In discussing the education of miners and their relation to the mine foreman, much has been said in reference to their attitude toward their own safety and toward the efforts made in their behalf to safeguard their work.

When passing into the mine a short time ago, I overheard a conversation between two miners that illustrates this point. They were as fine coal diggers as ever handled a pick, but more than that could not be said as they had no ambition to do anything else.

From their conversation I gathered that the old, experienced fireboss in charge of the section where these men were working had attempted the previous day to show them the importance of loading out the fine coal cuttings, or "bug dust" as it is commonly called. They had been throwing this back in the waste, and the fireboss, in trying to impress upon them the danger of a blownout or windy shot throwing this dust into the air and causing a dust explosion, explained that it had been found that each particle of fine dust that would float in the air was nothing less than a tiny gas bag.

The remarks of the fireboss were the topic of their conversation as they proceeded on their way to work. One stated with an emphasis that it is not necessary to repeat: "What do you think of that gas-bag yarn? Why, in the old man's day, miners did not know what an explosion was, or a blownout shot, and as for 'gas bags,' I guess they had none of them around. In those days, the government did not waste money hunting up dangers. There were no 'gas bags' and no explosions. They did not have a mining law as big as a family Bible—not much. I tell you, Jack, if there was less of this red tape, we would all be better off. Think of it—they even come around and tell a man how to set a post. Why, in the old man's time a miner was seldom caught by a loose piece of slate, and now men are getting killed every day."

The reply to this was: "You are right, Tom; if that old fellow was digging coal for a living and had to shovel 'gas bags' for nothing, instead of carrying that book of instructions and that safety lamp around the mine to make us believe he knows something, we would be better off."

This is only a fair sample of hundreds of such conversations in the daily life of the miner. It would seem that men would realize that conditions in mines today are wholly different from what they were in the days of their fathers. With the increased demand for coal, requiring the use of machinery and methods for its quick extraction that were not known in those days, it should be clear that the dangers of coal mining have greatly increased. A reasonable man readily understands that more precautions are necessary today than in the old days when the miner performed his work under less urgent conditions. Had the same conditions existed then as today, explosions would have been as frequent as Russian holidays.

Men who talk in this way do not realize that miners of yesterday were experienced workmen and avoided dangers of which the miner today is entirely ignorant, because he knows nothing of mining—in most cases had never seen the inside of a mine until his cousin sent for him and brought him from the old country to dig coal in American mines. Today, the experienced miner has largely disappeared, and in his place are foreigners taken from the farm and shop and in most cases unable to speak the English language.

These are the conditions that confront the mine foreman today. His task is almost superhuman. Naturally, violations of the law are frequent, and the foreman is not permitted to discipline his men for the act, but must "find some other way." His instructions are, "Increase the output; cut down the cost; fulfill the mining law in every respect." How to carry out these instructions is his problem.

James T. Reynolds, Assistant Foreman,
West Penn Mining Co.

Apollo, Penn.

Denies Investing for Kaiser

My attention has been drawn to the industrial news item published in Coal Age, Apr. 24, p. 742, which is evidently taken from numerous similar publications that have appeared in various newspapers on the Pacific Coast and which contained a number of misstatements that I have been obliged to correct in most emphatic terms practically each time they have appeared. Nothwithstanding this fact, many of the papers have persisted in referring to the story again and again, presumably because they consider it interesting reading. In doing so, they ignore the fact that such a publication of an untruth has the effect to prejudice unfairly important industrial interests both of myself and others associated in the same enterprise.

Permit me to assert briefly the following facts: His Majesty, William II, Emperor of Germany, so far as I know, has never directly or indirectly invested one cent in Canada, either through me or anybody else. Furthermore, my associates and I have never had $5,000,000 invested in Canadian coal fields. Our investments scarcely amount to $1,000,000. There is no reason why these investments should be "irretrievably lost," inasmuch as they are in companies formed under a British Columbia charter, and the shareholders comprise Germans, Canadians, Americans and Englishmen.

In closing, permit me to take this opportunity of saying that, although the press of this country has invariably insisted in conferring upon me the title of "Count," my proper name is the one with which I have always had the honor to subscribe myself.

Seattle, Wash.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

MINE EXPLOSION

Definition—A mine explosion is understood to be a violent disturbance of the atmosphere within a mine manifested by a destructive blast or rush of air accompanied by more or less flame, being the result of the ignition and combustion with explosive rapidity of gas and dust or either accumulated in the mine.

Gas Explosion—An explosion produced and maintained chiefly by gas accumulated in the mine workings and passages or mixed with the air current is described as a "gas explosion," although practically every mine explosion involves the combustion of both gas and dust.

Dust Explosion—An explosion in which the fine coal dust accumulated in the mine or suspended in the air current plays a prominent part is commonly called a "dust explosion," although it may have originated in a local explosion of gas, which is true of most mine explosions.

Few if any mine explosions are wholly due to gas or dust, but combine both of these elements in varying proportions, the character of the explosion as "gas" or "dust" being determined by the later evidences.

Development of a Mine Explosion—Explosion does not necessarily follow the ignition of gas in mine entries and workings. The firedamp mixture must, of course, be within the explosive range, as determined by the conditions in that portion of the mine. But even then a mine explosion will only take place when the **conservation of heat** is sufficient to render the explosive action self-supporting. Otherwise, a local explosion of gas or dust will expend its energy within a limited area and the disturbance will not be propagated throughout the mine.

The ignition of an inflammable mixture of gas or dust in the mine air may produce a considerable body of flame that, within the narrow confines of the mine, may gather force and generate sufficient heat to cause an explosion. **Experiment** has shown that an explosive mixture of gas and air placed in a tube and ignited at one end will burn quietly at first, then flutter or vibrate with increasing energy as the combustion penetrates deeper in the tube, the contending forces being the entering air and the escaping products of the combustion. This action, however, quickly develops sufficient energy to produce an explosion, which darts through the length of the tube.

The experiment illustrates more or less closely the development of an explosion in a mine entry or chamber. Investigation has shown that the **explosion gathers force** and probably **develops characteristic energy** within a few yards of its origin or the point where the ignition of the gas took place. This may vary from 10 to 30 yd. or more, depending on many conditions—chiefly the size or volume of air space available for the expansion of the gases of the explosion, the intensity of the igniting flame and inflammability of the mixture.

All of these factors determine severally the initiation as well as the character of the explosion and its limitations in the mine workings.

The Coal Age Pocket Book

RESCUE WORK

Entering a Mine after an Explosion—Prompt action and intelligent and effective measures are necessary for the rescue of any possible survivors of a mine explosion. The nature of the work and the great risk incurred in its undertaking demand that it shall be performed by the most experienced of the volunteers, of whom there is never any lack.

Immediately after an explosion in a mine, the following procedure is important:

1. Call for volunteers and from them choose those who are more experienced and familiar with the mine and the work to be performed.

2. At the same time, observe the mine entrances and judge of the probable effect of the explosion in the mine; examine the ventilating apparatus and have any necessary repairs made at once.

3. Collect the necessary safety lamps, tools, timber, canvas, brattice boards, nails, etc. Caged canaries or mice should also be provided, and two or more sets of breathing apparatus should make up the equipment.

4. Divide the rescuers into three parties, as follows:
  (a) Apparatus men to explore in advance;
  (b) Repair gang and rescuers;
  (c) Supply gang to render every possible assistance.

Organize each party under a competent leader who shall be in absolute control while underground.

5. Enter the mine at the earliest possible moment—the apparatus men proceeding first and keeping from 100 to 200 yd. in the lead of the others, who must not advance ahead of the air.

6. Each section of the mine should be explored by the apparatus men to discover any possible fire therein, before restoring the circulation in that section.

As quickly as any survivors are found they must be promptly removed to fresh air and the proper restoratives applied. At the surface, physicians should be in attendance and ambulances provided for the prompt removal of those brought out of the mine.

Suggestions on First-Aid to Explosion Victims—Those trained in first-aid work are the ones who should assume charge and have absolute control of the care of any survivors as quickly as found, until the arrival of a physician. The following brief suggestions are important:

1. Be calm and quiet; act promptly but not in a hurry; keep cool and observe closely every symptom and condition.
2. Remove promptly but carefully to fresh air.
3. Do everything possible to stop bleeding.
4. Examine for broken bones before moving far.
5. Use aromatic spirits of ammonia if stimulant is needed.
6. If overcome by gas, give artificial respiration.
7. If unconscious, loosen clothing, warm and stimulate by rubbing the limbs; give no stimulant if face is flushed and pulse strong, but sprinkle cold water on face and chest. If the body and limbs are cold, use warm applications; keep the patient covered with blanket or other coverings; apply smelling salts or spirits of ammonia cautiously to the nostrils.

Inquiries of General Interest

Electric Haulage Problem

The haulage road at a certain mine is 6000 ft. in length and laid with 30-lb. rails, which are bonded with 00 wire and bonding caps or sleeves. The rails are cross-bonded every 30 ft. An electric mine locomotive weighing 10 tons and using a current of 150 amp. is run on this road. A 0000 trolley wire supplies a current of 250 volts, which returns through the rails. A substation is located at one end of the line.

I would like to ask: 1. What will be the drop in volts at distances of 2000 ft., 4000 ft. and 6000 ft. from the substation? 2. What will be the percentage of loss in each case? 3. By installing a 0000 feeder wire and allowing 6 per cent. interest on the investment, what saving, if any, would be realized, the price of electric power being 2c. per kw.-hr.?

J. L. Gunter.

Handley, W. Va.

In estimating the drop at distances of 2000, 4000 and 6000 ft. from the substation, it is necessary to calculate the trolley-drop and rail-drop separately and add the results. Then, in order to estimate the possible advantage of installing a feeder-line of the same size as the trolley wire (0000), it is necessary to calculate further the combined trolley- and feeder-drop for the same distances.

The first step in the calculation is to take from an electric-wire table the circular mils of a 0000 copper wire, which is 211,600 circ.mils. For the combined trolley and feeder wires, the circular mils is double this amount, or 423,200 circ.mils. Now, to find the copper equivalent of two 30-lb. rails, properly bonded and cross-bonded, assume a rail-to-copper ratio of 11 : 1; that is to say, take the rail resistance here as 11 times that of copper, for the same sectional area. Then find the combined sectional area of two 30-lb. rails as follows: Since the weight of wrought iron is 480 lb. per cu.ft., and two 30-lb. rails weigh 60 lb. per lineal yard (36 in.), the cubic contents of the two rails is $60/480 \times 1728 = 216$ cu.in. per yd. The corresponding sectional area for the two rails is therefore $216 \div 36 = 6$ sq.in.

Again, since 1 mil is 1/1000 in., and a circ.mil is the area of a circle whose diameter is 1 mil, 1 circ.mil = $0.7854\ (1/1000)^2 = 0.0000007854$ sq.in. and 1 sq.in. = $1/0.0000007854 = 1{,}273{,}200$ circ.mils. The sectional area of the two 30-lb. rails in circular mils is therefore $6 \times 1{,}273{,}200 = 7{,}639{,}200$ circ.mils. For a rail-to-copper ratio of 11 : 1, the copper equivalent is $7{,}639{,}200 \div 11 =$ say, 694,500 circ.mils of copper.

It is now possible to calculate the drop of potential for the trolley line, feeder and rail return for each required distance by using the general formula,

$$\textit{Drop of potential} = \frac{10.8\ (\textit{distance} \times \textit{current})}{\textit{circ.mils}}$$

The drop of potential is expressed in volts and the current in amperes, while the distance is given in feet. Applying this formula to the present case gives for the drop at a distance of 2000 ft. from the substation the following:

$$\textit{Trolley-drop} = \frac{10.8\ (2000 \times 150)}{211{,}600} = 15.3\ \textit{volts}$$

It is evident that the combined trolley- and feeder-drop would be one-half of this amount, or 7.65 volts, since there are two wires of equal size for the transmission of the current to the locomotive. The rail-drop is

$$\textit{Rail-drop} = \frac{10.8\ (2000 \times 150)}{694{,}500} = 4.6\ \textit{volts}$$

The above results give the drop of potential for a distance of 2000 ft. For distances of 4000 and 6000 ft. the drop will be two and three times the above amount respectively.

A comparison of these results gives the following:

Total drop without feeder, $4.6 + 15.3 = 19.9$ volts
Total drop with feeder, $4.6 + 7.65 = 12.25$ volts
Voltage saved by feeder, $19.9 - 12.25 = 7.65$ volts
Wattage saved by feeder, $150 \times 7.65 = 1147.5$ watts

The percentage of drop in each case above is:

Without feeder (2000 ft.), $19.9 \times 100 \div 250 = 8.0\%$
With feeder (2000 ft.), $12.25 \times 100 \div 250 = 4.9\%$

Assuming 250 working-days of 8 hr. each (2000 working hours) in a year, the saving in that time at a cost for electricity of 2c. per kw.-hr. would be $2000 \times 1.1475 \times 0.02 = \$45.90$.

Against this saving must be reckoned the interest or fixed charges on the investment for the erection of 2000 ft. of feeder wire. At the present time the cost of copper is very high, having risen from 12 or 13c. per lb. to 20c. per lb. The weight of 0000 copper wire is practically 640 lb. per 1000 ft., making the cost for 2000 ft. of this wire, at 20c. per lb., $2 \times 640 \times 0.20 = \$256$. The cost of erection, including poles, will be about \$4 per 100 ft., or \$80 for a distance of 2000 ft., which makes the total cost of this length of feeder wire erected, \$336.

Estimating the fixed charges on this investment as, interest, 6 per cent.; depreciation, 4 per cent., and taxes and insurance, 2 per cent., making a total of 12 per cent., gives $0.12 \times 336 = \$40.32$. This estimate makes the net saving per year, $\$45.90 - 40.32 = \$5.58$.

Since the drop in potential, the saving in kilowatt-hours and the fixed charges are all proportional to the distance, the net saving per year will also be proportional to the distance, or \$11.16 for a distance of 4000 ft., and \$16.74 for a distance of 6000 ft.

In actual practice, however, the locomotive will not be running more than from one-half to three-quarters of the actual time, depending on the length of haul and other conditions, which will reduce the saving in kilowatt-hours at the same rate, while the fixed charges must remain constant. Although the figures would then show an excess of fixed charges over the saving in the cost of electricity, it would still be good practice to add the feeder wire. The gain in the operation of the locomotive will exceed what the actual saving in power would indicate.

Examination Questions

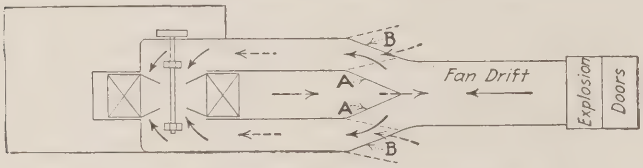
Pennsylvania Anthracite Mine Inspectors' Examination, Held at Wilkes-Barre, Apr. 20-22, 1915

(*Selected Questions*)

Ques.—What are the advantages and disadvantages of the exhaust and blew-fan systems of ventilation? What are the advantages of making fans reversible, and under what conditions would it be proper to reverse the air current? Show by plan how you would construct a fan drift so that the flow of air passing through a mine can be reversed.

Ans.—In the ventilation of a gaseous mine, the exhaust system of ventilation has the advantage that the main-intake airway can be used as the main-haulage road, which is impracticable in the blowing system of ventilation. One disadvantage of the exhaust system is that the ventilator is generally less efficient working on the warm mine air than when filled with the cooler outside air entering the mine. It is also more subject to the corrosive action of the warm, moist mine air under these conditions.

In the exhaust system of ventilation, the mine is ventilated under a pressure *below* that of the atmosphere and, on this account, the gases accumulated in waste and abandoned places readily find their way onto the main roads and airways. The blowing system avoids this trouble, the mine being then ventilated under a pressure *greater* than that of the atmosphere, by which the accumulated gases are forced back from the roads. It is frequently claimed, however, that the blowing system possesses the disadvantage that these gases expand more readily into the roads and airways when the fan ceases to work, while the reverse of this condition is claimed for the exhaust system.



Plan Showing Reversible Fan

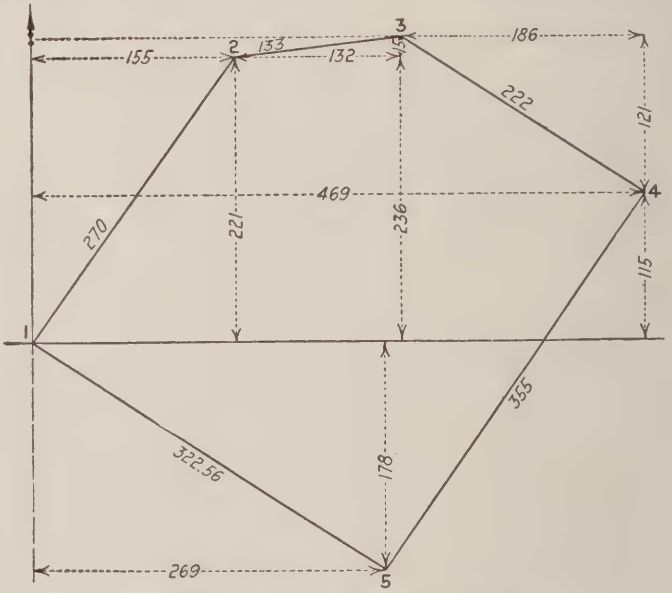
The advantage of a reversible fan is that the direction of the air current circulating through the mine can be changed at the surface when occasion may require. The air current in the mine should be reversed only when the conditions in the workings are thoroughly understood and there is reason to believe that lives may be saved or advantage gained by so doing. In the normal working of the mine the fan should never be reversed without first notifying and withdrawing the men.

The accompanying plan shows the arrangement of a fan drift that will enable the air to be reversed. The position of the doors *AA* and *BB* permits the air coming from the mine through the fan drift to pass to each side of the ventilator and enter the center opening of the fan, as indicated by the arrows. The dotted lines show the position of these doors when the fan is blowing air into the mine. The discharge opening of the fan is then connected with the fan drift. In this position of the doors the outside air enters on each side of the fan, and after passing through the ventilator is discharged into the fan drift and passes into the mine, as indicated by the dotted arrows.

Ques.—Plat the following traversed notes of a survey to the scale of 100 ft. to the inch.

Sta.	Dis.	Latitude	Departure	Total Latitude	Total Departure
1-2	270	221	155	221	155
2-3	133	15	132	236	283
3-4	222	121	186	115	469
4-5	355	293	200	178	269
5-1	322.56	178	269	0	0

Ans.—The accompanying figure shows the above notes of survey platted to a scale of 150 ft. to the inch instead of 100, to bring it within the column. Drawn to a scale of 100 ft. per in. the plat would be half again as large. In this question the south latitudes and the west departures should have been written —121, —293, and —200, —260. Likewise, for the total latitude, —178; but the total departures are all positive, being east departures.



Survey Platted by Departures

Ques.—State the advantages and disadvantages of large slow-running fans as compared with small high-speed fans in the ventilation of a mine.

Ans.—Large slow-running fans have the advantage of possessing a greater margin for increasing the circulation of air in mines. In other words, the range of capacity is larger than that of high-speed fans of smaller size. Large, slow-running fans require somewhat heavier foundations and cost more to install and operate. On the other hand, small high-speed fans have limited capacities or a less range in both gage and quantity and to that extent are less reliable for mine ventilation.

Coal and Coke News

Washington, D. C.

Reports of commercial conditions received in Washington from various sources are to the effect that the mining business in its different phases is showing some improvement. As yet there is, however, depression in coal in some places, though in others there is distinct evidence of revival. A report from Philadelphia to the Federal Reserve Board published in the current number of the "Bulletin" issued by that body states that "the anthracite coal business has improved."

On the other hand, the same authority reports from Cleveland that "the coal trade is still unsatisfactory, due to labor, legislative and trade conditons. Much Lake coal was carried over through the winter on the docks, and shipping will begin much later this year." From other soft-coal districts similar reports are received by various inquiriers here, and there is a general feeling that some time will be necessary to restore the business situation to normal so far as respects coal.

The Trade Commission Is Consulted

The first definite communication of an official nature between coal operators and the Trade Commission, which body is now in working order, occurred recently, when operators from Franklin County, Ill., appeared before the commission to state their views regarding certain trade practices and to get the ideas of the Commission on the subject if possible. They told the commission that they merely wanted to obtain official sanction for what they had heretofore done, and that if their acts of coöperation were approved, there would be no attempt to make agreements to control prices. The sole object would be to keep down the cost of production.

Furthermore, they desired permission to compare notes with one another over market conditions. For instance, it was noted, a prospective purchaser may tell one operator that another operator offered to sell coal 10c. cheaper and thereby argue the price down, whereas, as a matter of fact, the prospective purchaser may be falsifying about the prices quoted by other operators. The operators desire to have a system of coöperation so that they can compare notes. They would also like to compare ideas and methods of mining so that they could be able to produce the coal at the lowest possible cost.

HARRISBURG, PENN.

The Governor has succeeded in putting through one of his "pet measures," the child labor law, and it is now in his hands for signature.

Employed children who will not have reached the age of 16 by Jan. 1, 1916, will probably lose their employment, and their homes this source of income likewise. It is estimated that several thousand boys employed about coal mines of the state will be thrown out of employment by the operation of the law. Coal company managers and superintendents employing boys between 14 and 16 years of age are almost unanimous in their disapproval of this statute.

The new law gives the employer the choice of employing children between the ages of 14 and 16 for 42 hours a week and overseeing their attendance at school for a least 8 of the remaining hours, or not employing children below 16 years of age at all. It is declared by managers and superintendents of both coal and industrial operations that to arrange a working schedule to suit the needs of the law for children under 16 would be far more tedious and complicated than is practical for them to attempt and they will therefore dispense with the employment of these children.

The law is already having an effect, for in a number of places the children who will not have attained the age of 16 by January, 1916, are now being weeded out, none others being employed who will not comply with the law when it is in force.

One of the large anthracite companies estimates that it will discharge between 300 and 400 children at once.

Senator Crow has introduced a bill to amend section 4 of article 19 of the act of 1911, providing that bituminous mine inspectors who have served for 8 years and have passed two examinations shall be exempt from any further examination and providing for their suspension and removal. The amended section reads as follows:

The principal examination shall be in writing and each applicant shall also undergo an oral examination pertaining to explosive gas, safety lamps, methods of ventilation and mine management. The questions and answers thereto in the oral examination shall be reported verbatim by an expert stenographer and typewritten fully to assist the Board in the work of rating the qualifications of the candidates: Provided, That any person who has served as a mine inspector continuously for 8 years and has passed two consecutive examinations for the office of mine inspector shall be exempt from taking any further examination and shall continue in said office without any further examination unless removed or suspended as provided by Article 21 of the Act of June 9, 1911, P. L. 756, section 4, of the act of Apr. 14, 1903, P. L. 180. Any candidate who shall make a general average of at least 90 per centum shall be deemed successful. The manuscripts and other papers of all applicants in the principal examination together with the tally sheets and the correct solution of each question as prepared by the Examining Board, and also the stenographer's report of the oral examination shall be filed in the Department of Mines. The Examining Board or at least four members thereof shall certify to the Governor and also to the Department of Mines the names and percentages of all successful candidates who are properly qualified under the provisions of this article to fill the office of Inspector. A certificate of qualification prepared by the Chief of the Department of Mines shall be issued to each successful candidate.

The Examining Board shall as soon as practicable after the examination furnish to each applicant on printed slips of paper a copy of all questions (oral and written) given at the examination marked "solved right" "imperfect" or "wrong, as the case may be."

Bill to Bring Bituminous Miners Under Compensation Act

The bill prepared by the attorney general and introduced by Senator Miller, to bring the bituminous miners under the workmen's compensation act, has been amended by the committee on Mines and Mining, and section 1 of the proposed act now reads:

In order to secure efficient management and proper ventilation of the mines, to promote the health and safety of the persons employed therein and to protect and preserve the property connected therewith the operator or the superintendent shall employ a competent and practical mine foreman for every mine where 10 or more persons are employed, who shall be under the supervision and control of the operator. The mine foreman shall have full charge of all the inside workings and the persons employed therein subject, however, to the supervision and control of the operator in order that all the provisions of this act so far as they relate to his duties shall be complied with and the regulations prescribed for each class of workmen under his charge carried out in the strictest manner possible. If the mine is generating explosive gas in quantities sufficient to be detected by an approved safety lamp, the mine foreman must possess a first grade mine foreman's certificate, or be a person who in the judgment of the operator is a person equally competent with the holders of such certificate. If the mine is non-gaseous the mine foreman must possess either a first grade mine foreman's certificate or a second grade mine foreman's certificate, or be a person who in the judgment of the operator is equally competent with the holders of such certificates.

When the mine workings become so extensive that the mine foreman is unable personally to carry out the requirements of this act pertaining to his duties, he shall have the right to employ a sufficient number of competent persons to act as his assistants who shall be under his instructions and the operator's instructions in carrying out the provisions of this act. If the mine is generating explosive gas in quantities sufficient to be detected by an approved safety lamp the mine foreman's assistants must possess first grade assistant mine foremen's certificates or be a person who in the judgment of the operator is equally competent with the holders of such certificates.

In case of the necessary temporary absence of the mine foreman, he may deputize his work for the time being to his assistant, who shall perform all the duties of the mine foreman. And the right to hire and discharge employees, the management of the mine and the direction of the working forces are vested exclusively in the operator and no person or persons, association or associations, organization or organizations, corporation or corporations, shall interfere with or attempt to interfere with, abridge or attempt to abridge in any manner whatsoever such right: Providing, that this act shall not invalidate any existing contract.

Chairman Hess, of the House Committee on Mines and Mining attempted to have the Catlin bill recommitted to his committee for the purpose of amendment, stating that a similar bill affecting the bituminous miners had been passed by the Senate, and suggested that both be incorporated into one measure, which would then bring the wording of the third paragraph of section one of the bituminous measure in force in the anthracite region, but the House was against recommitment.

The Supreme Court Is Appealed to

The Alden Coal Co.'s appeal from the decision of the Dauphin County Court, which has held to be constitutional the anthracite tax law, which requires mining companies to pay to the state 2½ per cent. ad valorem on all coal shipped to market (with the exception of washery coal) was filed with the Supreme Court on May 5.

The coal companies affected by this act are attacking it, on the contention that it is class legislation. Much interest is being manifested in the case in view of the fact that taxes already levied total no less than $5,000,000.

The Alden Coal Co.'s stand is identical with that of the 100 or more coal companies which have appealed from paying the state tax. The appeal is based on the ground that bituminous coal is not taxed; that all localities are not benefited alike by the distribution of the tax funds, that the company is not liable to tax on coal shipped outside of the Commonwealth and that the company is already paying state and local taxes.

Neither the state nor the coal companies are optimistic about quick settlement. So much importance is attached to the court's decision and there are so many authorities cited in defense of the stands taken by the corporations and the state that it is considered almost impossible to have all the appeals ready for the Supreme Court which convenes at the Capitol on May 24.

Voluminous records are now being prepared by the coal companies, and it is doubtful if these will be prepared by the 24th, which means that the appeals would have to be heard when the Supreme Court convenes during the first week in October.

Prospects of a long session of the Legislature are also an obstacle in the path of the appeals, since the business of the lawmakers would force the printers to delay work on the records in the tax case.

PENNSYLVANIA

Anthracite

Georgetown—The engine house at the Katydid colliery of the Red Ash Coal Co. was destroyed on May 6 by fire of unascertained origin and several hundred men and boys will be thrown out of work until a new engine house can be erected. For a time the flames threatened to set fire to the breaker and machine-carpenter shops. The destruction of the machinery in the engine house will cause the shut down of Nos. 1 and 2 collieries of the company.

Springfield—The Court of Northumberland County on May 3 dismissed a preliminary injunction which restrained the Coal Township School Board from collecting $70,000 taxes for 1913 from the Philadelphia & Reading Coal & Iron Co., the Lehigh Valley Coal Co. and the Mineral R.R. & Mining Co.

Plymouth—Several "button strikes" are on in the anthracite region and several thousand men are affected. At Plymouth about 1500 men and boys at the Buttonwood and Parrish collieries went on strike because a few men refused to pay back dues and attain good standing with the United Mine Workers of America. At Shamokin 1000 or more went on strike on May 6 at the Scott colliery of the Susquehanna Coal Co., because some of the men are not members of the organization. Several hundred men went out at Oakhill colliery at Minersville, until wages are raised to what they claim is a scale equal to that of other collieries. The men also allege that they are being overcharged for powder furnished. Four thousand employees of the Packer collieries Nos. 2, 3 and 4 of the Lehigh Valley Coal Co., struck recently because 12 carpenters reported for work without union buttons. It is feared the strike will extend to other operations.

Wilkes-Barre—More than 1200 men were present on May 5, at the 8th annual dinner of the Wilkes-Barre District Mining Institute, in Irem Temple. It was an impressive gathering of laboring men, all engaged in the same occupation. The guest list included the names of general managers, superintendents, foremen, miners, and laborers of all classes. The dinner, an excellent but simple meal, was served by the Y. M. C. A., with a corps of volunteer waiters from the various coal offices throughout the valley. One of the features of the evening was the graduation of three students of the mining school who had completed the three year course. These are Edmund P. Thomas, of the Kingston Coal Co., Sidney Davis, of the Lehigh & Wilkes-Barre Coal Co., and Fred G. Williams, of the Delaware, Lackawanna & Western R.R. Co. coal department. The diplomas were presented by president Thomas H. Williams, who also refunded to them the tuition fees which they had paid into the school during their course, as one of the rewards of their perseverance and ambition.

Scranton—Miners working in the drift of the Diamond mine recently threatened to go on strike unless the company furnished better ventilation. It was claimed by the men that several laborers were overcome by the bad air. It is believed that the matter will be amicably settled.

Pittston—More than 650 men attended the 8th annual banquet of the Pittston Mining Institute, oldest in the anthracite region, at the Pittston Armory on May 8. Captain W. A. May, president of the Pennsylvania Coal Co., was among the speakers. In his address, Attorney Evan C. Jones, of Wilkes Barre, referred to the institute as the exemplification of altruism. The institute has a membership of 700 and holds monthly meetings in the Pittston Y. M. C. A.

Bituminous

Somerset—In spite of the depressed condition of the coal market the mines of Somerset County are as active as at any time last year. The plants at Hooversville, Ralphton, Jenner and Jerome are working full time, the last named loading 95 steel railroad cars every day. The average number of cars of coal handled daily in the local yards of the Baltimore & Ohio R.R. is 450, which is about all the yard superintendent can take care of with present facilities.

Pittsburgh—Judge John D. Shafer in an opinion on May 5, dismissed the petition of John H. Jones, one of the receivers of the Pittsburgh-Buffalo Coal Co., in which he asked the court to require George H. Calvert, master appointed by the court to sell the coal properties, to cease advertising the mines for sale, pending the decision of the Supreme Court in an appeal taken by Mr. Jones from the decree of the lower court ordering the sale. The property is being advertised for sale on May 27, it was stated to the court at an argument, so that the sale would not be made before the decision of the appeal to the higher court. The court states that it does not see how the advertisement hurts the Pittsburgh-Buffalo Co.

Connellsville—Evidences of returning prosperity are to be found on the railroads of the Connellsville coke region, particularly the Pittsburgh & Lake Erie and its allied system, the Western Maryland. It is said that both the Pittsburgh & Lake Erie and the Western Maryland are giving their trainmen such steady work that fast freight trains have been held up until the crews completed their 8-hr. rest period The Western Maryland within the next few weeks will begin hauling coal out of the Fairmont region by way of Connellsville, using the Baltimore & Ohio tracks to this point.

Uniontown—Orders have been issued by the W. J. Rainey Co. for the resumption in full of all ovens at the Allison plant of the company. There are 400 ovens at this plant, 350 of which have been in steady operation. The firing of the 50 additional ovens will provide employment for a number of heretofore idle men at this plant.

Republic—Six first-aid teams composed of the employees of the Tower Hill Coke Co., have begun a course of instruction in first-aid and mine-rescue work that, when completed, will enable the members to take examinations for American Red Cross diplomas. The teams will meet weekly for two hours for instruction from D. B. and H. O. Millward, who not only hold the Red Cross diplomas but also those from the American Mine Safety Association. Dr. W. S. Kimmell is a member of the executive committee and assists with the work. The course will continue for three months at the end of which time the Red Cross will appoint examiners to conduct an examination for certificates.

WEST VIRGINIA

Charleston—Several of the larger coal operations in Raleigh County that have been carrying the accounts of their employees during the slack season in order to hold them together in anticipation of the resumption of active operation have notified these employees that the rent for the houses occupied by them during the past six months of virtual idleness will be remitted and that the terms of leasing for the purpose of collections of rentals will date from the resumption of work by their occupants.

Fairmont—Fifteen hundred miners are wanted by the Consolidation Coal Co. to man seven mines that will be put in commission shortly. Mines now in commission are being operated to their limit. The mines to be opened are: Beechwood No. 30; Murray No. 45; Montana No. 24; Shaft Mine No. 38; Meadow Brook No. 55; Coal Station No. 62, and Two Licks No. 39. These operations will run with a full compliment of men six days a week as long as the car supply holds out.

Huntington—The West Virginia Coal Operators Association opened temporary headquarters in the Robson-Prichard Bldg., recently. A. H. Land, secretary of the organization, has charge of the office. A meeting of the executive committee of this organization will be held in Huntington May 14, when plans relative to a campaign of education to familiarize producers and consumers with scientific coal costs will be discussed. This association has no political object, as has been rumored in the past.

ALABAMA

Birmingham—The Sloss-Sheffield Co. will resume operations at the Bessie mines, at the furnace at Florence, and the coke ovens at Blossburg and Brookside, about May 15. One thousand men will be employed. These plants have been closed down for six months.

TENNESSEE

Nashville—Two measures which have been recommended by the Democratic steering committee for passage by the Legislature, are the semi-monthly pay day bill and a bill to create a state mining department. Another measure which is also recommended provides for re-organization of the state geological department. The Workmen's Compensation measure has not been treated, the committee waiting for further reports from sub-committees.

The State Mining Department has announced that certificates have been issued to those who have satisfactorily stood examination for foremen of mines in Tennessee as follows: John Pass, of Cardiff; J. A. Tidewell, of Emery Gap; I. S. Montgomery, of Cardiff; A. C. Montgomery, Harriman; S. J. Ingram, A. M. Derrick, L. Carroll, C. Bolin and S. S. Bledo, of Rockwood.

KENTUCKY

Harlan—It is reported that the Stonega Coal & Coke Co. is planning to build a road across the mountain from Keokee to its mines at the head of Clover Fork in Harlan County. W. J. Gennery, store manager for the company, recently made the trip from the Virginia town to the head of Clover Fork by automobile, being the first to reach that point by this means.

Ashland—A meeting of the directors and others who recently organized the Kentucky River Coal Corporation will be held here on May 19 at which time various details of the merger will be taken up and worked out.

Middlesboro—The clean-up and paint-up campaign which has been engineered by the health authorities and mine operators is having a general effect. The miners are brightening up their homes and one Middlesboro dealer in the last two weeks reports the sale of wall paper for more than 200 miner's houses.

Whitesburg—There is continued improvement in activities in coal mining throughout eastern Kentucky, especially in the Elkhorn and Boone's Fork fields. Both the Consolidation Coal Co. and the Elk Horn Mining Corporation in the Jenkins-McRoberts-Fleming field have large orders sufficient to keep all their mines running full time. Hundreds of new miners are being added daily to the work. Railroads entering the territory are taxed to handle the output. Continued increases, however, will be made as the work advances.

Praise—The Eastern Kentucky Block Coal Co. is beginning a coal development a few miles from here on the Carolina, Clinchfield & Ohio R.R. A mining town has been started and the opening of mines is giving employment to several hundred men.

OHIO

Columbus—The Sunday Creek Coal Co. of Columbus has taken over the sales end of the San Toy mines, of the Jones and Adams Coal Co. at San Toy Ohio. The mines are now known as Sunday Creek mines Nos. 401 and 402.

C. E. Haskins, receiver for the Starr-Hocking Coal Co., which has mines in Athens County, received a bid of $5000 for the property when offered for sale at public auction for the second time at the court house, Columbus. J. G. Westwater submitted the bid for unnamed parties. The court will be asked to approve the bid.

Teegarden—The announcement is made by the West Pittsburgh Coal Co. that its mines near Teegarden, Ohio, will be opened soon. The mines have been idle for almost a year. Extensive improvements have been made on the tipple.

INDIANA

Indianapolis—The Supreme Court of the United States has declared constitutional the Indiana law requiring coal mine owners to provide wash houses for their employees. The operators attacked this law as being class legislation and on the ground that it permitted minority rule, as it provided that a wash house must be furnished if only 20 miners petition for it.

Linton—The Lattas Creek mine which has been idle for six months has begun working again.

Clinton—In accordance with the decision of the Supreme Court upholding the validity of the Indiana miners' wash house law, miners in this district will promptly prepare petitions, asking that such houses be supplied. The Bunsen Coal Co. already has wash houses with shower baths and clothes lockers.

ILLINOIS

Maryville—The casting holding the drum for the hoisting table at the Donk Mine here broke recently while hoisting. The cage fell back, and before the engineer could bring the engine to a stop considerable damage was done to the tipple and other top works. Four hundred miners have been thrown out of work until repairs can be made.

Carterville—The Carterville Coal Co., the oldest operating coal company in the Williamson County field, with offices in St. Louis, has gone into the hands of a receiver. The general business depression, with a narrowing market and slow collections, were assigned as the cause.

PERSONALS

W. Roland Cox, consulting mining engineer, of New York, has removed his offices from the City Investing Building to the Equitable Building, at 120 Broadway.

W. A. Lafont, secretary of the Rutledge & Taylor Coal Co., of St. Louis, Mo., has severed his relations with that firm after a continuous period of 16 years with it.

J. H. Lane, for the past 10 years in charge of Oliver No. 3 plant of the Oliver & Snyder Coal & Iron Co., has been promoted to the position of general superintendent of the three Oliver coke plants and also of the Southwest Water Co., succeeding the late Fred C. Keighley.

A. H. Wood, of Petros, Tenn., president of the Petros Coal Co., and who has for some time past been consulting engineer for the Turley Coal Co., whose headquarters are at Atlanta, Ga., with a mine at Turley, Tenn., has severed his connection with the last named company in order to be able to devote more of his time to the Harlan Coal & Coke Co., which he has just recently organized to develop a coal lease he has in the Harlan, Ky., field.

J. H. Healy has resigned his position as vice-president of the Black Hawk Coal Co., the Consolidated Fuel Co., the Castle Valley Coal Co., and the Panther Coal Co., which he filled for 18 years, this resignation to be effective July 1. Mr. Healy will take a two months' vacation, the first he has taken in 20 years. E. L. Carpenter, president of the above named companies, will in future perform the duties formerly assigned to the operating vice-president, and as soon an injunction proceedings are settled the four companies will be consolidated into the United States Fuel Co. Robert M. Morgan has been appointed general superintendent. He was formerly superintendent of the Utah Fuel Co. at Castle Gate, Utah.

OBITUARY

Dr. C. Clifton Ferrell, president of the Export Pratt Coal Co., was shot and killed by two burglars at Praco, 39 miles from Birmingham, Ala., recently. The burglars attempted to break into the commissary adjoining his home. Dr. Ferrell was 50 years of age and was a well-known educator, author and student. His remains were taken to Hopkinsville, Ky., for interment.

Alexander Thompson, of Pittston, Penn., mine foreman for the Pennsylvania Coal Co. since 1876, died on May 6 in St. Francis' Hospital, San Francisco, Calif. He was stricken with pneumonia while on a pleasure trip to the western coast on his first vacation in 50 years. He was born in Scotland, learned mining in his native land and came to the anthracite region in 1866. He was a rock and shaft-sinking contractor before becoming a mine foreman. Mr. Thompson had been a city councilman and was at the time of his death president of the Pittston City Planning Commission. His son, Dr. James R. Thompson, is bringing the body home.

Col. Lloyd Burrel Huff, aged 43, died at his home "Rose Fountain Park" at Greensburg, Penn., on May 5. Death was due to Bright's disease, from which he had been suffering for more than a year. Colonel Huff was widely known and was interested in large coal holdings in Westmoreland, Cambria and Indiana Counties in Pennsylvania and in West Virginia.

Col. Huff was born in Greenburg, Dec. 8, 1871. He was the son of the late Congressman G. E. Huff and Mrs. Henrietta C. Huff. He received his preliminary education in the public schools at Greensburg and was graduated from the Rensselaer Polytechnic Institute at Troy, N. Y. Upon his graduation from this institute he engaged in the coal business with his father and became a factor in many coal companies in Westmoreland, Cambria and Indiana counties.

He was president of the Keystone Coal & Coke Co., the Pittsburgh, McKeesport & Greensburg Ry. Co., the Westmoreland Hospital, the Allegheny Co., a coal company of Washington, D. C., and the United Brick Co. He was also a director in the Acme Gas Coal Co., the First National Bank of Greensburg, the Keystone Clay Products Co., and the Latrobe-Connellsville Coal & Coke Co.

Col. Huff was married about 9 years ago to Eleanora Moorehead, of Pittsburgh. He was a member of the staff of Governor Hastings and in this manner acquired the title of colonel. He is survived by his widow, two daughters, and his mother.

INDUSTRIAL NEWS

Pittsburgh, Penn.—The J. A. Brennan Drilling Co. has changed its name to the Pennsylvania Drilling Co. It has also moved its Scranton office to 2623 Whitehall Bldg., New York. The firm will continue business under the same management and officers as heretofore.

Birmingham, Ala.—A substantial increase in the coal trade, and a prevailing tone of optimism among operators are felt throughout the Birmingham district. It is believed that within a short time the improvement in conditions will warrant a 100 per cent. operation in some of the mines.

Fairmont, W. Va.—A gain of nearly 200,000 tons was made in the Chesapeake & Ohio coal shipments for the month of April over the previous month. The total shipments in the four districts amounted to 1,796,990 tons, gains being recorded in every district. Kanawha district shipped 523,100 tons; New River 508,555; and Guyan district shipped 486,495 tons.

Columbus, Ohio—The lately organized Jackson-Hocking Coal Co. has opened headquarters on the fourth floor of the Columbia Building. George M. Silcott, who has heretofore made his headquarters at Nelsonville, will be in charge as vice-president and general manager. The company owns three mines which were bought at receiver's sale of the Maple-Gallia Coal Co. These have a combined capacity of 700 tons per day.

St. Louis, Mo.—At the recent annual meeting of the Western Coal & Mining Co. and the Consolidated Coal Co., Kingdon Gould, of New York, was succeeded as president by W. J. Jenkins, of St. Louis, who has been vice-president and general manager. These two companies which have mines scattered throughout several states on the so called Gould railroads are two of the largest in the Middle West. The new president, Mr. Jenkins, has been associated with the Gould properties for many years and no radical changes are likely.

Pittston, Penn.—Work on the new Ewen breaker of the Pennsylvania Coal Co. is progressing in good shape. Last December the breaker burned down, a lot of stick timber being left that was not consumed. Considering the time taken to clear away the débris and get down to real building, the work shows that no time is being lost in replacing the structure. The mines thrown idle were Nos. 7 and 4 shafts and the Hoyt, but the coal from the latter was sent to the No. 14 breaker, so there was no general suspension at that particular colliery.

Harrisburg, Penn.—An order was issued on May 8, by the Public Service Commission directing that the Pennsylvania, Lehigh Valley and the Lehigh & New England R.R. companies establish a through route for the transportation of coke and coal from the producing regions in Pennsylvania to the plants of the Lehigh Fire Brick Works, the Bryden Horseshoe Co. and the Crane Iron Works, located in Catasauqua. The Commission also ordered the companies to establish joint rates, as follows: Upon coke, from Galilitzin, $1.65, a ton; from Latrobe, $1.85, and from Connellsville, $2.05. Upon coal from Clearfield and Latrobe, rate group, $1.75; from Greensburg, rate group, $1.85, and from Westmoreland, rate group, $2.05. The rate and routes are to become effective on or before May 17. It was the contention of the complainants that they were required to pay unreasonable rates and were unable to compete with other industries.

Harrisburg, Penn.—Shipments of anthracite coal in April were the largest ever reported for that month. The total volume of coal moved was 6,486,201 tons, compared with 6,072,164 tons last year, an increase of 414,037 tons. With April's large tonnage the total anthracite movement for the first four months of this year is almost equal to that of last year. In the four months ended Apr. 30, a total of 20,481,241 tons was moved, compared with 20,534,050 tons last year, a decrease of only 52,809. The Lehigh Valley R.R.'s tonnage in April was unusually large and all companies reported increased shipments except the Philadelphia & Reading R.R. The Lehigh Valley also leads in the amount of coal moved in the first four months, its tonnage being nearly 500,000 tons ahead of the Reading, which shows a decrease of 900,000 tons from last year. The Delaware & Hudson and the Lackawanna companies show a larger tonnage for the first third of the year. The Pennsylvania R.R. reported a loss of 151,575 tons. Following are the individual tonnages for April, Philadelphia & Reading, 1,181,959; Lehigh Valley, 1,303,119; Central R.R. of N. J., 770,356; D. L. & W. R.R. Co., 977,948; Delaware & Hudson, 642,913; Pennsylvania, 647,395; Erie, 737,548; Ontario & Western, 215,963; totals, 6,486,201.

Coal Trade Reviews

General Review

April anthracite makes a new record, but the trade is slowing up notably. Heavy loading in foreign trade the feature of the bituminous market. Internal consumption continues low. Light movement in Lake trade.

The official figures of the anthracite shipments for April more than sustained the predictions of a heavy production, the movement having established a new high record for that month. In addition to this the official figures also show a substantial decline in stocks at Tidewater, but in spite of this apparently encouraging technical position of the market, the trade is showing a general slowing up in all directions. There is a decided paucity of orders among some shippers, while concessions of 5c. and 10c. are necessary to move coal, and a general curtailment is anticipated in the immediate future. The market is particularly weak on the steam sizes, and large concessions are being reported on pea coal. In addition to this the Western movement is not particularly large.

Loading on foreign accounts from Atlantic Range ports continues extraordinarily heavy, the announcement by the British Government of a conditional embargo against exports having resulted in another spurt in this business. This offshore movement is now attaining to such proportions that it will soon be a potent factor in the general market situation, and will undoubtedly do much to relieve the heavy pressure under which the bituminous market has been laboring for so long.

The slightly firmer tone of the past week or two has been well maintained, but the closing up of the large navy contract, involving nearly a million tons of Pocahontas coal, on the basis of $2.73 is significant evidence of the underlying weakness. The market is being maintained only by the most rigid restriction in production, and the movement is confined almost entirely to contracts, the consumption on which is at a minimum.

Unless there are some most unexpected developments in the Lake trade late in the season, the movement in this direction will be even more disappointing than last year. The large consumers in the Pittsburgh district are not increasing orders, although there are conservative observers who believe that consumption is slightly larger, and that stocks are being drawn on for the extra tonnage. Competition from outside districts continues so aggressive that prices are under constant pressure, and shippers find very little encouraging in the situation.

There is so little business to be had in the Middle Western market that the agencies do not consider it worth while to reduce prices to obtain it, with a result that quotations are relatively well maintained, though at a low level. It is developing that a great many contracts have been closed at close to the cost of production. Rumors of a big consolidation of a number of the large Middle Western interests is a feature of the week's developments. The screenings market continues so strong that operators will soon be forced to crush other grades to meet the demand on this size.

BUSINESS OPINIONS

War scares cause a note of hesitancy. Basic conditions still considered highly favorable. "Engineering News" reports a significant increase in building operations.

Financial Chronicle—Owing to the dislocation of trade occasioned by the war, abnormal conditions prevail practically everywhere, and it behooves our people to proceed cautiously until the outlook becomes clearer and the possibility of sudden and strange surprises no longer exists. Even the United States Treasury cannot claim exemption. It is distinctly weaker than it would be if its income had not been so seriously impaired by the war. The truth is, under the continued falling off in revenues, with the coincident increase in the expenditures, the Treasury situation has now reached a point where we should imagine it must at times be causing much anxiety.

Bradstreet's—Undercurrents run in a favorable direction though trends in certain lines and some sections, affected either by weather conditions or marked dependence on a particular commodity, still lag. But by and large, the outstanding factors indicate that industry has made further progress; steel mills are operating at close to 75 per cent. of capacity; buying of pig iron, helped by speculative purchases, has spread; plants making war supplies are pushed to the utmost; additional export orders of magnitude are pending and unemployment is decreasing.

Dun's — Business conditions show comparatively little change, and though the recent cheerful outlook is maintained, convervatism goes hand in hand with increased confidence.

Engineering News—Contemplated building operations in 23 cities in the Eastern States from plans filed in April show a gain of $4,000,000 or 16% compared with the same month last year. This gain is progressive for in March it was only slightly over $1,000,000, in February $3,000,000 and in January about the same. It is the largest gain recorded for more than a year. For the first four months the gain in these cities aggregated $9,000,000 or 11%. A falling off of $1,000,000 recorded in 25 Central cities, compares with one of more than $3,000,000 last month and nearly as much in each of the two previous ones. The loss of $1,300,000 in 14 Southern cities compares with one of over $2,500,000 in the previous month.

Iron and Steel—A falling off in the unfilled tonnage of the United States Steel Corporation of less than 100,000 was not unexpected for the output of steel products in April was substantially larger than in March. The steel manufacturers, those doing purely an ordinary business, are running to about 75% of capacity. One of the favorable developments has been the placing of several orders for steamships; contracts for at least four boats have been signed within the last ten days. Buying of pig iron has broadened out following large purchases of Southern foundry by speculative interests. Railroad purchases are small but the earnings of carriers have so improved that larger buying may soon take place.

American Wool and Cotton Reporter—Foreign wools, Australian and Capes, were the only feature of the Boston wool market this week. Total sales for the week ran about 1,750,000 lb., 75% of these being Australians and Capes. There is a distinct feeling in the market that fine wools will continue for a long time to be valuable property. Coarse wools, which have been most desirable for army cloth purposes, have remained high because of the war. Wools around the world are 50% higher than the average price.

The Southern Lumberman—Reports from leading hardwood markets for this week are more encouraging than for some time past. Development is spring business has been slow but steady, and now has assumed a volume which is gratifying.

Boston News Bureau—Of course the present situation depends entirely on foreign developments. There are numerous favorable features that are presenting themselves, such as the splendid outlook for wheat, our remarkable foreign commerce, the improvement in railroad earnings, the reduced surplus of idle cars, our strong financial position and the averting of war between Japan and China. These, however, are so overshadowed by foreign complications that they cease to carry the weight warranted.

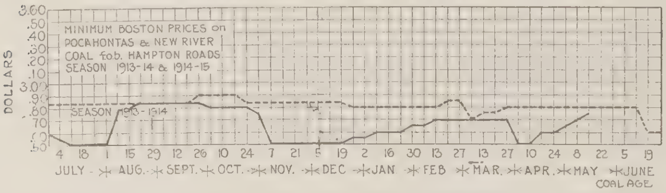
ATLANTIC SEABOARD

BOSTON

Pocahontas and New River market continues on a better price basis. No gain in demand, however. Export market closely followed, but buyers still holding back. Georges Creek demand off-shore keeps up but Pennsylvania grades are dull. Anthracite shippers beginning to get short of orders.

Bituminous—The market on Pocahontas and New River has developed no new features. The slight improvement reported last week in conditions f.o.b. Hampton Roads has been maintained and there is a slightly firmer tone both with respect to future business and current inquiry for export. The recent closing of a Navy Department contract at $2.73 f.o.b. is an instance of this slight improvement. Coastwise there is practically no demand for spot coal and the agencies are working almost exclusively on contract arrangements. Shipments are coming forward regularly but there is still an entire lack of snap to the trade in this territory. The export market is being followed with much interest here but there is some difference of opinion as to its probable bearing on the trade. The weight of the argument seems to be with those who feel that the foreign demand is bound to broaden and this will have a marked effect on prices. Should the railroads be called upon to meet such an extra demand it is likely that the deficiencies of equipment that have been suffered through the hard times will come to light all too plainly.

Meanwhile, buyers who have not yet made season contracts are still tempering the market and a supply of consignment cargoes at the distributing points here has been sufficient to encourage them in their holding off. For tail-end of cargoes, prices have been as low as $3.40 on cars Providence and $3.50 at Boston. Such figures net nearer $2.50 f.o.b. than $2.75@2.80.



Georges Creek output is still being confined to Baltimore loading and will continue to be routed there until the present delay in steamer loading is overcome. The ships of this grade were pioneers in several foreign markets and they are now getting results both from work put in heretofore and from their new financial connections. In this territory there is no change in prices and except in scattered instances no improvement in the demand for this grade.

The Pennsylvania coals share the general dullness. Inquiry is lax and with West Virginia coals so low in price for small lots inland there is very little chance even for Cambrias and Somersets. A fair volume of these coals is coming forward in conjunction with anthracite from Philadelphia but even this business will probably sag off in a few weeks. All-rail the movement is light. Most of the consumers are well behind their usual requirements.

Anthracite—There is already a decided lack of orders among some of the shippers, and concessions of 5@10c. are made in order to move coal. A general curtailment is looked for in the near future. The steam sizes and dock screenings are still in good demand in this market.

Current quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*..........	$0.85@1.40	$1.15@1.60	$1.67@1.77	
Philadelphia*.....	2.10@2.65	2.40@2.85	2.92@3.02

Boston†.........	....	....	....	3.50@3.73
Providence†......	....	....	....	3.40@3.68

* F.o.b. †On cars.

NEW YORK

Bituminous quiet with shipments heavily restricted. Improved outlook in the export trade. Anthracite slowing down. Heavy April shipments create a surplus. Pea coal a drug on the market.

Bituminous—The soft coal market continues dull with little change from last week. Operators and shippers are full of hope, however, for a reversal of conditions in the near future. The mines are not very active but sufficient coal is being received here to meet all demands. As a result of this conservatism on the part of operators the market is not flooded with demurrage coal. Spot coals are scarce. Operators are realizing there is not much profit in shipping coal to this market when it must be sold at a loss to save demurrage charges. Mine owners as a rule are not shipping any more coal than they have orders to fill. This necessitates a curtailment of production and in the Cambria and Clearfield districts the mines are working on about a two and one-half day schedule. Those in the Somerset district are doing about four days a week while other mines with excellent coals are working from one to one and one-half days a week. On the other hand the mines in the New River district are working about four and one-half days a week and those in the Pocahontas district a trifle better.

The export business is becoming stronger. Inquiries are increasing. Some have come recently from Italy, Egypt, France and quite a number from Argentina. Many of the inquiries have been regarding New River and Pocahontas coals. One report had it that a New York banking house with French connections has been making inquiries regarding the shipment of 250,000 tons of three-quarter gas coal, and the same amount of run-of-mine to b,e used for the French Government.

In the local harbor the cheapest quotation heard is $2.25. The general quotations on various grades are as follows:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek	$3.00@3.10	$3.00@3.10	$3.00@3.10	$1.45@1.55
Clearfield, medium	2.65@2.80	2.50@2.65	......	1.10@1.25

Westmoreland	2.90@3.15	......	......	1.15@1.60
W. Va. three-quarter	......	2.30@2.55	2.30@2.55	.90@1.00
W. Va. mine-run	......	2.50@2.90	2.50@2.90	.95@1.35
West. Maryland	......	2.25@2.40	2.25@2.40	.80@ .90

Anthracite—As predicted last week shipments of hard coal during April were greater than during the corresponding month of last year. Not only that, but April shipments were greater than those of any previous year. The shipments for the month were 6,486,201 tons while the best previous record for April shipments was 6,224,396 tons, made in April 1910. At the same time the coal on hand at Tidewater decreased from 873,698 tons on Mar. 31 to 735,567 tons on Apr. 30, a total of 138,131 tons. Notwithstanding these figures, shippers in this market say the anthracite coal business is quiet. Coal is plentiful at the docks. The mines are working full time and the Lake trade is taking its share of the supply. Egg coal is stronger while the greatest pressure has been on nut coal.

The steam coals remain inactive. There is plenty of these grades on the docks with little demand. Good qualities of pea coal have been quoted at from 40 to 50c. off while some of the cheaper grades are being sold at whatever can be obtained for them. There is no market for Nos. 1 and 2 buckwheat while No. 3 is in fair demand.

Quotations run about as follows:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken..	$4.65		$4.70	-
Egg..................	4.90	$4.80	4.95	$4.85
Stove................	4.90	4.80	4.95	4.85
Chestnut	5.15	5.00	5.20	5.05
Pea..................	3.35@3.50	3.10@3.35	3.40@3.55	3.15@3.40
Buckwheat...........	2.50@2.75	2.25@2.50	2.55@2.80	2.30@2.55
Rice................	2.00@2.25	1.90@2.10	2.05@2.30	2.00@2.25
Barley..............	1.75@2.00	1.60@1.75	1.80@2.05	1.85@2.10

BALTIMORE

The export trade continues the predominating feature. May shipments on foreign account will run close to quarter of million tons. General domestic situation remains dull.

The attention of the coal trade here is riveted on the immense foreign movement. At the present rate of loading it seems assured that 250,000 tons will be dumped into vessels here in May for foreign delivery. Most of this is going to South American account but large quantities are also going to Italy and Egypt. With the British Board of Trade having ruled that no coals shall be exported from the United Kingdom except to the war allies of that country, a large field is opened up to American coals that was previously held exclusively by the Welsh and English. It is generally expected that this will do much to relieve the flat coal situation.

The general situation as regards the local market remains dull. There is a little better feeling and slightly heavier ordering as a general thing, but there is still plenty of room for improvement. Prices are somewhat steadier, especially on the better grade coals.

Less desirable coals are still offering cheap. Maryland and West Virginia low-grade steam coals are to be had at from 80 to 90c. at the mines to the trade. From 90c. to $1 is asked for less desirable Pennsylvania line coals. The gas-coal situation remains weak.

The charters for the past week included the following:

Vessel	Nationality	To	Rate
William Chatham		Tiburon	$6.50
St. Helens		Tiburon	6.50
Alvarado		San Diego	6:98
Biblster	British	Barcelona	
Modiva	Northern	Isabela de Sagua, Cuba	
Ferndene	British	Palermo	
Christoforos	Greek	Mediterranean port	
Ubbergen	Dutch	Havana	
Linda Fell	British	Alexandria, Egypt	
Bertrand	British	River Plate port	0.39
Heighingham	British	Barcelona	0.28
Henry Ibsen	Northern	Barcelona	0.39

Note—Steamers are indicated by **bold face type,** all others being schooners.

PHILADELPHIA

Anthracite trade beginning to lag and curtailed operations likely in the near future. Operators handicapped with small sizes. Bituminous shows little disposition to improve.

Anthracite—The past week has shown a marked falling off in the demand, particularly on the small sizes, and as many of the large operators have carried over considerable of these, the lack of storage room is likely to result in a partial suspension of mining. It is also understood that the demand for chestnut has fallen off to such an extent that it will soon be necessary to store this size also. Broken, egg and stove still continue active, with the preference, if anything, on stove. Egg is also in good demand and there is no difficulty experienced in disposing of the production of broken. The price war in certain sections of the city makes the dealers rather uncertain about their position, and causes many of them to hesitate about taking on additional stocks, until something like order is restored. Collections are also reported slow.

Individual operators are taking advantage of the situation to quote coals that are inactive, at prices less than circular, although it is understood that the concessions are not heavy as yet. April prices for May and June delivery are frequently noted. The trade as a whole does not compare favorably with last year. At that time the mines operated full all through the month of May, but the prospects of continuing on this basis during the current month are not reassuring.

Prices at Tidewater rule about as follows:

	Circular	Individuals
Broken	$4.35	$4.25
Egg	4.60	4.60
Stove	4.60	4.60
Chestnut	4.85	4.75@4.80

Bituminous—While there is considerable moving, most of it is being applied on contracts. Tidewater deliveries are prompt, and it is understood there is little or no coal standing for which disposition has not already been made.

HAMPTON ROADS

Export shipments continue heavy. Government colliers loading. Accumulations at Tidewater somewhat in excess of normal.

Dumpings over the Tidewater piers for the week, while not as heavy as anticipated, at the same time have shown up well. This is especially true as regards the export movement which continues heavy. The bulk of the export cargoes have gone to Italy with other shipments to South American, West Indian and other ports. One cargo of 8013 tons was shipped to Soubaja, Java, and about 10,000 to Spain. The shipment to Soubaja is one of the largest that has ever left Hampton Roads for Java.

Coastwise shipments have consisted of New River and Pocahontas mine-run, nut and slack and the high volatile coals but all shipments going foreign have been mine-run exclusively and a greater portion of them were Pocahontas coal.

The circular prices, so far as can be ascertained, are being maintained except where, perhaps, a shipper has coal on demurrage.

The bunker movement for the week has not shown up so well. It is understood that a fleet of these vessels is due for the coming week and with the Government colliers due and other tonnage expected it is believed that heavy dumpings will be made during the next few days. The following Government colliers are expected to load at Hampton Roads during May: "Proteus," "Nereus," and "Cyclops." These vessels will take approximately 38,000 and this with coal already taken by the Government will assist materially in swelling May dumpings at the various piers.

The following vessels sailed from Hampton Roads with cargoes of coal during the week Apr. 30 to May 7, inclusive:

Norfolk

Vessel	Destination	Tons
Montoso	San Juan	3000
Dinsdalehall	Genoa	4200
Posillipo	Gib for orders for Italy	8100
Mar Terso	Siracusa	4392
Jas. W. Maxwell	Para	1714
Tea	Caglairi	7158
Chinche	Chilian Ports	1900
Guineguada(bark)	Las Palmas	405
Henrik Isben	Valencia	7032
Palembang	Soubaja, Java	8013
Scillin	Messina	4392
Paddington	Spezia	5622
Wegadesk	Colon	6500
Tabor	St. Thomas	5500
Sicania	Italy	5316
Pendarves	Barcelona	3447
Boniface	Para	605
Windsor	Savona	7979
Juan	Kingston	1100
Haugarland	Venice	6550
Poviga	Savona	4475
Berlin	Kingston	2800

Newport News

Vessel	Destination	Tons
Wearbridge	Rio de Janeiro	5889
Svend 2nd	Havana	3000
Honduras	Havana	2715
St. Lenords	Rio de Janeiro	6400
Kanawha	Rio de Janeiro	2800
Oakland Grange		6300
Florizel	Port au Spain	

Virginian Ry.—Dumpings of this road at Hampton Roads for the week ended May 8 amounted to 178,738 tons.

Norfolk & Western Ry.—Dumpings of this road for the week ended May 8 were 138,105 tons.

Note—Steamers are indicated by **bold face** type, all others being schooners.

OCEAN CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Falk	Norwegian	Philadelphia	Kingston, Ja.	1126	
Tysland	Danish	Philadelphia	Cienfuegos	876	
Chelston	British	Philadelphia	Havana	2389	
Iona Tunnell		Philadelphia	Galveston	1118	
Penaghi Lykiardopoulos	Greek	Norfolk	La Plata	2054	$8.40
Rosalia	Italian	Norfolk	Santos	2673	9.60
Den of Crombie	British	Baltimore	West Coast Italy	3128	10.80
Ferndene	British	Baltimore	Palermo	2444	
Modiva	Norwegian	Baltimore	Sagua	778	
Maude Palmer		Norfolk	Para	1485	
Dorothy B. Barrett		Baltimore	Boston	1799	
Claveresk	British	Philadelphia	Havana	2441	
Robert P. Murphy		Philadelphia	Porto Rico	572	
Edwina		Philadelphia	Porto Rico	398	
Robert A. Snyder		Philadelphia or Virginia	Nassau	302	
Urd	Norwegian	Philadelphia	Barcelona	1968	
St. Andrews	Norwegian	Philadelphia	Havana	1899	
Malinche	British	Philadelphia	Antilla	1165	
Clara A. Donnell		Atlantic Range	Canary Islands	990	
St. Helens		Atlantic Range	Tiburon	1212	$6.50
William Chatham		Atlantic Range	Tiburon	915	
Alvarado		Atlantic Range	San Diego	940	6.95
Augustus Welt		Norfolk	Rio Janeiro	1111	
Marguerite		Philadelphia	Mayport	1475	1.00
Linda Fell	British	Baltimore	Alexandria	1924	
Ubbergen	Dutch	Baltimore	Havana	1150	
Sif	Norwegian	Newport News	Martinique	1959	

Note—Steamers are indicated by **bold face type**, all others being schooners.

OCEAN FREIGHTS

Numerous export charters. Prohibition of British coal exports creating an expansion in American shipping. Rates easier to South America but firmer to Mediterranean.

The sinking of the "Lusitania" has had no appreciable effect as yet on the freight market. We continue to charter one or two steamers daily for export coal, and the action of the British Government in placing an embargo on the exportation of coals from Great Britain to countries other than her allies or colonies, will undoubtedly increase the exportation of American coal very materially.

Since our last report about 15 steamers have been chartered for Plate and Brazil coals, a few of which charters were effected in London for shipment of coal from here, and we find that the charters we have made will average about 48c. per ton less than the charters closed on the other side.

South American rates are easier but Mediterranean rates are stronger owing to the firm offers that are being made by Philadelphia parties of $10.80, all freight paid in advance for steamers to take coal from U. S. Range to Genoa.

Ocean freights are now quotable on the following basis:

To	Rate	To	Rate
Havana	$2.25@2.50	Bermuda	$3.50@3.75
Cardenas or Sagua	3.25@3.50	Vera Cruz	**3.50**

* To a direct port on the West coast of Italy.
† With 800 tons per day discharge.
**Spanish dues for account.
W. W. Battie & Co.'s Coal Trade Freight Report.

LAKE MARKETS

PITTSBURGH

No improvement in demand in general market and Lake shipments still very light. Prices irregular. Production at 50 to 60% of capacity.

The Pittsburgh district coal market is growing no better with the progress of the season. While Lake shipments are slightly increased they are still very small and no hopes are entertained for anything like a normal volume of shipments before July 1 at the earliest. Unless an unusual demand develops late in the season the movement as a whole will show little improvement over the disappointing tonnage of last year.

Retail demand continues light and manufacturing demand has shown no increase, having been practically stationary for several weeks. Reports from the steel trade are of production at an unchanged rate so that there has been no reason to expect an increase in coal shipments either to producers or consumers of steel. The railroad demand is only fair.

Prices for Pittsburgh district coal continue very irregular. It is claimed here that other districts are making the market, although of course it is admitted that the local competition is keen. There is very little contracting either for Lake shipment or for local consumption. The asking price on contracts to run to Apr. 1 remains at about $1.15 for mine-run, but it is probable this could be shaded. On Lake coal (¾-in.) the regular market continues to be $1.15 to consumers or $1.10 to dealers, but very little is being done at any price. For ordinary prompt shipment the market is quotable about as follows, subject to occasional concessions: Slack, 70@80c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1@1.05; ¾-in., $1.10@1.15; 1¼-in., $1.20@1.25, per net ton at mine, Pittsburgh district. Mining operations are at the rate of 50 to 60% of capacity.

BUFFALO

Trade continues in the rut particularly toward Canada. Slack the only size in any demand. Consumers apparently cleaning up their supplies. Anthracite slowing down and concessions are reported.

Bituminous—In spite of the acknowledged dullness of the trade there is a general feeling that the actual consumption is steadily increasing. The large consumers, including the leading railroads, are cleaning up their stocks of coal probably with a view to buying as little as possible till after the close of the fiscal year at the end of June.

There is no stir yet in the Canadian trade. It appears that Canada is going to turn her attention more and more to the European war and her manufacturing will be along that line. Some believe that this is sufficient to insure a large factory activity, but if the amount of coal taken is any indication, there is not much business there now. Buffalo coal shippers watch the Canadian market closely, but find little encouragement there as yet and the prospect for an early improvement is not very good. Quotations on bituminous coal remain as before, on the basis of $2.70 for best Pittsburgh lump, $2.55 for three-quarter, $2.45 for mine-run and $2.25 for slack, with the market bare of the latter. Allegheny Valley sizes are about 25c. lower than Pittsburgh.

Anthracite—The trade is dropping off. Some sellers are apparently reconciled to this as being quite seasonable, while others point out that with all the effort to stimulate buying by cutting the price, the tonnage has not been large this spring; as a result the trade has lost doubly to the consumer, who is not only getting coal at a reduction in many instances, but it is economizing in quantity. The westward movement of anthracite is not heavy, either by Lake or rail, though no particular complaint is made. Only one shipper is crowding coal westward, the others believing that if it sells eastward there is no need of urging it in any other direction. Anthracite shipments by Lake for the week were 85,000 tons, destined to eight ports, but the great bulk of it as usual, goes to the heads of the Lakes.

TORONTO, CAN.

The market remains dull and heavy with little indication of any improvement.

The trade continues quiet, both in domestic and manufacturing lines. Dealers do not anticipate much change in conditions for some time, as the industrial situation shows little indication of improvement. Prices for bituminous remain unchanged, quotations for best grades being as follows: Retail, anthracite, egg, stove and nut, $7.50; grate, $7.25; pea, $6. Bituminous, steam, $5.25; screenings, $4.25@4.50; domestic lump, $6; cannel, $7.50. Wholesale f.o.b. cars three-quarter lump, $3.56; screenings, $2.90.

TOLEDO

More boats will go up the Lakes despite light coal movement. Domestic trade fair in spots. Low level of water on the Lakes.

Considerable coal has arrived here and some little Lake coal has been shipped but the water movement is unusually light for this season of the year and little is expected in the way of improvement until some of the coal carried over at the upper docks is moved. There will be some movement by June but the really heavy Lake trade will not begin until July.

It is stated that the water in the Lakes is lower than usual which makes it necessary to load coal and ore boats to 18½-ft. draft instead of 19 ft. as was formerly carried. This means that there will be more boats in commission this year than usual for Lake carrying. There is some slight movement in Kanawha splint, Kanawha gas and Fairmont coal for Lake shipment. Owing to the fact that the Pittsburg No. 8 mines are practically all closed because of labor difficulties, Cambridge coal is selling rather better than usual here and prices are fairly strong.

The domestic trade is naturally at the dull season of the year. Prices are not ruling especially firm, depending largely on the urgency of the seller or buyer.

COLUMBUS

The trade continues quiet. Some activity is developing in Lake business and the tone of the market is slightly improved. Prices are still low.

All branches of the business are still quiet and prices are rather weak at former levels. The stocking period has not yet arrived and as a consequence there is little doing in domestic sizes. However, future prospects appear brighter than formerly.

Domestic business is scattered. Only small orders are being received to piece out stocks for the present. There is no disposition on the part of retailers to increase stocks and they have been devoting their energies to cleaning up. Domestic prices are unchanged from the levels of the previous week. Pocahontas lump is selling around $4 while West Virginia splints are quoted at $3.50 for lump and $3.25 for mine-run. Hocking Lump is rather strong at $3.25. Anthracite is also receiving some attention.

Lake trade is showing more activity. Some bottoms have been loaded with Ohio coal and started for the Northwest. Reports from the Upper Lake ports show that there is a large tonnage still on the docks and the interior movement is limited.

Production in Ohio fields has not increased to any extent during the past week. Some spurts are noted in the Hocking Valley where Lake trade is active. But generally speaking the output in the Hocking Valley and allied fields has been about 25% of normal. In the Pomeroy Bend field the output is not more than 40% of the average.

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.45	$1.50	.....
Inch and a quarter	1.30	1.35	$1.30
Three-quarter inch	1.25	1.30	1.25
Nut	1.15	1.25	1.15
Mine-run	1.05	1.10	1.05
Nut, pea and slack	0.60	0.60	0.55
Coarse slack	0.50	0.50	0.45

CINCINNATI

The market is dull in all departments. Prices generally weak except in smokeless. Buying is very slack.

The failure of the industrial situation to mprove, except in isolated cases, is largely responsible for an extremely dull market, and for very limited buying in all departments. The Lake movement, save from some of the new districts in the Kanawha field via the C., H. & D., is by no means satisfactory and such coal as is being moved is not shipped up the Lakes but is stored at the docks, in anticipation of better business later on.

The domestic market is at a complete standstill by reason of the general reluctance of the retail trade to buy, and industrial consumers seem to feel the same way about steam coal. Contracting has been considerably hampered by this feeling, buyers preferring to take up spot coal at low prices and take their chance of a rise later on. Everything is still waiting for a general improvement in business.

CLEVELAND

The trade is showing a marked weakness as compared with two weeks ago. The spot market is again down to the low point of the spring.

The absorbing power of the market does not increase Receipts run less than 300 cars over Sunday, but they stock the market. Fine coal is being sold at $1.65@1.75 and coarse grades in proportion. The Lake trade is not taking much coa and the local markets are getting as much surplus coal a they did all winter. Jobbing prices are so low that operator are unable to make anything, but they are not low enoug to let the jobber make a profit. As has been the case a goo part of the last six months the shipment prices to jobbers ar equal to spot prices.

While industries are increasing their operations slowl the contract business has been very small. Most of the com panies are buying on the open market and the outlook is th the contract business will be done late in the summer. O large shipper has not bought any coal except what goes o long-term contracts.

Lake shipping is very light. Only shippers are operatin their full fleets, and a number of these have only part their fleets in service. The Upper Lake docks are well su plied with coal.

Quotations for shipment to jobbers are as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmont	W. Va. No. 8
Lump	$3.10	......	......	......	......
Lump, ¾ in.	.....	$2.20@2.25	$2.00	$1.80@1.85	$1.75@1.
Egg	3.10	......	......	......	......
Mine run	2.65@2.70	2.10	1.85	1.85@1.90	1.75@1.
Slack	......	1.65	1.60	1.65@1.70	....

COKE

CONNELLSVILLE

Coke market dragging with prospects good but prices still low. Some contracting for foundry coke. Production decreased and shipments increased to the largest in months.

A contract for about 10,000 tons monthly of high-grade Connellsville furnace has been closed for the second-half of the year, the contract being practically a continuation of one now in force covering the first-half. Two or three other second-half contracts are under negotiation, but consumers show no haste. While nearly all operators regard the outlook for the more distant future as relatively good, it remains a fact that there is cheap coke on the market and until a moderate quantity has been absorbed prices are not likely to advance, however good the prospects. Spot coke, indeed, is a shade easier.

We quote furnace coke at $1.50@1.60 for spot, $1.60@1.65 for shipment to July 1 and $1.75 for shipment over second half. A few consumers have been in the market for foundry coke over the twelvemonth to begin July 1 and a number of contracts for from one car to half a dozen cars a week have been closed at about $2.40, this being for very high-grade coke. Other coke, of standard grade, is available down to $2.20. There is spot furnace coke as low as $2, but the best grades are held at $2.35 or higher.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended May 1 at 292,891 tons, a decrease of 6602 tons, and shipments at 303,377 tons, an increase of 9711 tons, and making shipments the greatest in any week for many months.

Buffalo—There is more activity in coke at the ovens than for some time and it is expected that this will extend this way soon, though it has not done so to any extent yet. Smelters are in operation, with a slightly increased demand for their product. It is believed that the improvement will continue. Prices are founded on $4.15 for best 72-hr. Connellsville foundry and $3.15 for stock coke.

Chicago—Furnace and foundry coke shows no change in prices or demand, and some byproduct coke has been sold during the past week at low prices. There seems to be no way of stimulating the market. Prices are as follows: Byproduct, $4.45@4.65; Connellsville, $4.60@4.75; Wise County, $4.50@4.65; gas coke, $3.75@4; furnace, $4.50@4.65.

St. Louis—Inquiries on foundry coke are few and far between. On byproduct coke a small tonnage is moving in from the East for domestic purposes. Local gas house coke is going out to various yards for storage, and the capacity of the local plant is crowded. There will be a large movement of this to the domestic consumer, beginning the middle of this month.

MIDDLE WESTERN

GENERAL REVIEW

Dullness still prevails but prices show no backward tendency. Screenings strong. Smokeless and Kentucky coals weakened. Anthracite slow.

Shipments of domestic and steam sizes during the past week have been reduced, although prices are fairly well maintained. The movement is less at this time of the year than in past seasons. The trade is not inclined to handle much consignment coal in the present state of affairs. So little business is in sight that it is not considered worth while to reduce prices to obtain tonnage.

Open confidence in the future is reflected in all phases of the trade, although present conditions are anything but satisfactory. Undoubtedly a number of contracts have been made at prices below the cost of production, due to delay on the part of the operators in getting their selling organizations in working order. Another year there is every reason to believe that Illinois, Indiana, Kentucky and West Virginia producers will have more effective selling organizations.

Most of the orders now being received are for future delivery, requests for immediate shipment being few and far between. It is said that loading of lake vessels is very slow, and it is not anticipated that the tonnage will be large before early next month. The docks still have a large accumulation of coal.

The operators continue to restrict production in keeping with market requirements, which means that the Indiana and Illinois mines still kept open are operating between two and three days per week. Screenings are strong, and the fine coal market is about reaching a point where the operators will soon be crushing mine-run or other sizes to meet requirements. It is difficult under prevailing conditions to fix definite prices for the coarser grades of coal, and it is easy to secure concessions of 5c. to 10c. per ton on these sizes when an order is offered for immediate acceptance. On steam coals, and particularly screenings, prices are fairly strong and on a parity with last week's figures.

CHICAGO

Steam coals fairly active but domestic grades are flat. Operations generally much restricted. Some Hocking on demurrage.

Southern Illinois mines virtually have no demand for domestic sizes, although the steam coal is strong, with prices somewhat higher than last week. Mines are being closed down rather than to sell domestic sizes under cost. There are some Saline County domestic sizes being shipped for steam purposes to prevent an over-accumulation of loaded cars at the mines.

A better state of affairs is reflected in the Springfield district, and screenings are strong at 80c. per ton. The demand for domestic coals from the Indiana mines is practically at a standstill, and steam sizes are moving slowly. Screenings from this district are strong.

Eastern Kentucky coal is doing almost the impossible thing of standing still, and there is little or no movement of these fuels into this territory.

There is nothing to be said about Hocking coals except that a few cars of demurrage coal have been sold during the past week at sacrifice prices.

The smokeless situation is still backward and there is little buying.

The demand for anthracite shows an improvement. Some storage orders have been placed, and May buying promises to cover a much heavier tonnage than April. Prices are well maintained.

ST. LOUIS

Movement light and prices maintained with difficulty. Rumor of a consolidation of Carterville selling interests.

Only a small tonnage of coal is moving and there is no tendency to stock up on any of the sizes. The maintaining of prices on coal from the Standard field, or the effort to maintain them, has caused several buyers to purchase coal from the Carterville field at a 15c. higher rate. Carterville lump and egg can be bought for as low as $1 at the mine, while Standard lump and egg is held at from $1.10@1.20. The difference of 15c. a ton in favor of the Standard coal, which is inferior to Carterville, has forced the buyers to use the latter.

It is understood that a movement will be consummated in the next few days that will bring the Carterville operators into a selling agency to prevent ruinous competition. The headquarters of this movement will likely be in Chicago, and several sales agencies will be eliminated.

An exceptionally good tonnage of anthracite is moving in the first of May and a fairly good tonnage of smokeless has been ordered and some moving. Storage purchasing will be slow this year in a domestic way, perhaps even more so than last year, which was distressing to the retailer.

INDIANAPOLIS

Mines doing about three to four days a week. Prices steady; slack relatively the best sale. A very small improvement in the factory demand.

The coal industry in Indiana keeps at a steady level as to volume and prices. The demand for domestic lump is small as is to be expected at this season. Later on the movement to the Northwest will begin but at present steam coal is all that is going in that direction. The railroad demand changes little and there is only a microscopical improvement in the industrial takings. Screenings continue to be the backbone of the trade; they sell quite readily at 85 to 90c. On other grades prices are at the summer level. Mines are making something better than half-time. The retail yards have begun stocking up with Eastern coals, in order to obtain the advantage of the low April prices.

The operators in order to avoid the necessity of closing down entirely are shutting off portions of the mines and operating the remaining rooms full time. Contracting is about up to normal for the season; prices, as a rule, are the same as those prevailing last year. Most of the mine owners seem not to expect much revival in trade until the fall demand begins.

KANSAS CITY

Trade generally dull but shows a slight increase due to a better manufacturing demand.

Business is exceedingly dull according to the dealers. The wholesale trade has been holding up well and increasing with a slight increase in manufacturing lines. The operators say that they have been operating their mines nearly to capacity for the past week. They claim that they will begin the extensive winter preparations, probably as early as the last of June, as they expect an early season this year. The mines in the central part of Missouri have been operating steadily and many cars of domestic lump are standing on the tracks. The number arriving here is increasing every week.

PORTLAND, ORE.

Business quiet. Mine owners in Utah and Wyoming send notice that prices will advance 25c. per ton June 1. Wood prices lowest for many years, which weakens coal market.

Business in coal for domestic purposes is very quiet here for the present, and yet dealers face the probability of an advance of 25c. per ton on Utah and Wyoming coals June 1, as they have received notice to that effect. It is supposed that the step was taken by the mine owners to induce May purchases. Wood is cutting into the coal business more than ordinarily just now because of low quotations offered. The price is $4.50, the lowest in many years. How long this price will rule is an open question. The coal dealers put in their summer or storage prices a few weeks ago and may be forced to advance the retail price 25c.

PRODUCTION AND TRANSPORTATION STATISTICS

ANTHRACITE SHIPMENTS

Anthracite shipments for April and the first four months of 1914-15 were as follows:

	April		4 Months	
	1915	1914	1915	1914
Phila. & Reading........	1,181,959	1,185,930	3,597,874	3,884,153
Lehigh Valley...........	1,303,119	1.160,742	4,038,489	3,579,875
Cent. R.R. N.J.	779,356	748,162	2,439,902	2,766,684

Ont. & Western.........	215,963	199,659	688,842	741,790
Total..............	6,486,201	6 072,164	20,481,241	20,534,050

THE CAR SITUATION

The surplus of idle coal cars on May 1 amounted to 119,545 and the shortage 130. The gross surplus of all kinds of idle equipments for the past three months compares as follows: May 1, 1914, 230,533; Apr. 1, 1915, 327,441; May 1, 1915, 290,819.

SAULT STE. MARIE CANALS

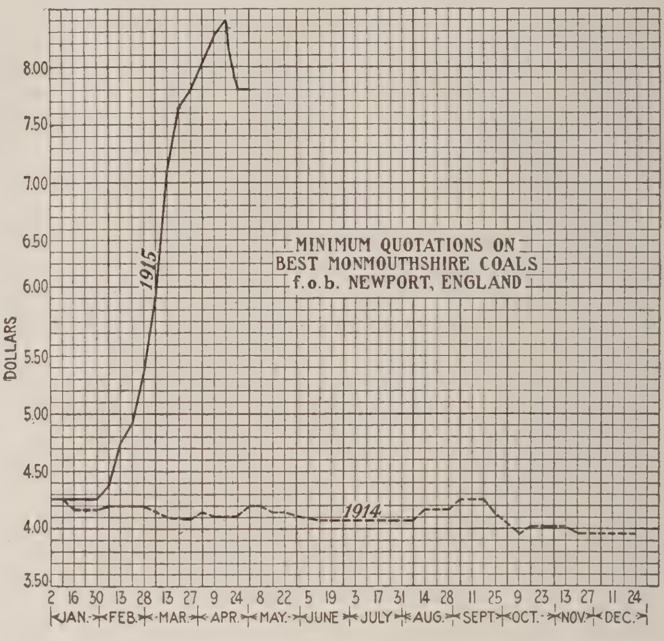
Shipments of anthracite through the Sault Ste. Marie Canals for April of the current year amounted to 130,111 tons. Bituminous shipments totaled 149,455 tons. Bituminous shipments were confined entirely to the United States Canal and 8459 tons of anthracite only passed through the Canadian canal. The United States canal opened Apr. 17 and the Canadian canal Apr. 13.

FOREIGN MARKETS

GREAT BRITAIN

Operators and miners reach an agreement on the Coal Conciliation Board. Reduction of rates on interned steamers. Restriction of exports.

Apr. 30—The coal trade throughout the country during the past week showed little notable change, what change there was being towards a little more coal available at maintained prices. The anthracite trade naturally was quiet, in view of the embargo on exports to neutral countries. The renewal of the Coal Conciliation Board has now been arranged. After discussing the details jointly and separately for many months, the coal-owners' and miners' representatives on Wednesday signed an agreement of renewal. In the House of Commons this week, the President of the Board of Trade stated that he was in communication with the London County Council regarding the Committee's recommendation in favor of the accumulation of a stock of coal in London.



Apr. 30—Conditions for prompt shipment remain easy, while for May shipment colliery owners are quoting with a great deal of firmness. Quotations are approximately as follows:

Best Welsh steam.......	Nominal	Best Monmouthshires....	$7.80@7.92
Best seconds...........	Nominal	Seconds................	7.68@7.80
Seconds................	$7.92@8.40	Best Cardiff smalls......	5.16@5.28
Best dry coals..........	8.16@8.64	Cargo smalls..........	4.44@4.56

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Tonnage is offering freely and chartering continues active. Rates show a heavy decline and are approximately as follows:

Gibraltar.........	$4.80	Naples..........	$6.72	Las Palmas......	$5.04
Marseilles........	5.79	Venice..........	9.60	St. Vincent.......	5.16
Algiers...........	5.79	Alexandria.......	6.72	Rio de Janeiro....	6.00
Genoa............	6.72	Port Said........	6.72	Monte Video.....	5.76
				River Plate......	6.00

Note—These quotations are based on an exchange rate of 24c. to one shilling.

DIVIDENDS

The following is a partial list of some of the more important dividend declarations by the coal companies:

Island Creek Coal—Regular quarterly dividend on the common of 50c., payable May 1 to holders of record, Apr. 23, and on the preferred of $1.50, payable Apr. 1 to holders of record, Mar. 23.

Lehigh Valley Coal Sales Co.—Regular quarterly dividend of $1.25, payable Apr. 17 to holders of record Apr. 8.

Pittsburgh Coal Co.—Regular quarterly dividend on the preferred of 1¼%, payable Apr. 26, to holders of record Apr. 15.

Delaware, Lackawanna & Western Coal.—Regular quarterly dividend of 2½%, payable Apr. 15 to holders of record Apr. 1.

Burns Bros.—Regular quarterly dividend on the common of 1¼%, payable May 15, to holders of record May 1, and quarterly dividend No. 9 on the preferred of 1¾%, payable May 1 to holders of record Apr. 16.

Consolidation Coal—Regular quarterly dividend of 1½%, payable Apr. 30 to holders of record Apr. 24. The transfer books do not close for this dividend.

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

✚Indicates contracts regarding which official information has been received.

Recast

In the following table we give a list of all old contracts coming up for consideration during the ensuing week. The table gives our contract number, the name of the purchaser, city, tonnage and page on which the detail notice appeared.

No.	Purchaser	City	State	Tonnage	Page
558	Board of Education	Hamilton	Ohio	1400b	709
616	Lighthouse Inspector	San Francisco	Calif.	b	795

[1] Also $3.08, 3.30, 3.16. [2] Also $3.90. [3] Also $3.43. [4] Also $3.38. [5] Also $3.31 and 3.26. [6] Also $3.43. [7] Anthracite, buckwheat No. 1. [8] Also $3.25. [9] Also $3.41 and $3.59. [10] Anthracite pea. [11] Also $4.89. [12] Also $4.85. [13] $4.79. [14] Anthracite nut. [15] Anthracite furnace.

PROPAGATING GARDENS—Chas. F. Miller & Co., $3.94. HOSPITAL FOR THE INSANE—New Central Coal Co., $2.95; Peerless Coal Co., $2.98; Quemahoning Coal Co., $3; Piedmont & George's Creek Coal Co., $3.10; Sullivan Bros. Coal Co., $3.07; Weston Dodson Co., $2.95; Davis Coal & Coke Co., $2.89; W. H. Bradford, $2.88; Consolidation Coal Co., $3.30; Enterprise Coal Co., $2.87; George's Creek Coal Co., $3; Lynah & Read, $3.07. U. S. SOLDIERS' HOME—Enterprise Fuel Co., $3.53; C. W. Hendley & Co., $3.40. NATIONAL ZOOLOGICAL PARK—Chas. F. Miller & Co., $3.99. GOVERNMENT PRINTING OFFICE—National Coal Co., $3.20. ARMY MEDICAL MUSEUM—Henry W. Zeh, $5.78. Address Acting Sec. of the Treasury, Byron R. Newton, Gen. Sup. Com., Washington, D. C.

✚No. 448—Springfield, Mass.—The proposals noted in this contract (p. 834) do not supersede those previously requested for Apr. 15 (p. 627). The new contracts are to supply the requirements of the Ordnance Department. A bond for $3000 will be required only of the successful bidder, and not of all bidders, as previously noted. All bidders will be required to submit an amount equal to 2% of the estimated amount involved in the contract. Address Commanding Officer, Springfield Armory, Springfield, Mass.

✚No. 454—Cleveland, Ohio—Bids on this contract (pp. 627-748), which provides for furnishing coal for the East 53rd St. Station of the Municipal Electric Light Department will be received until noon, May 28. Complete specifications and details may be obtained on application. Address Comr. F. W. Ballard, Heat and Light Dept., 1443 East 3rd St., Cleveland, Ohio.

✚No. 465—St. Louis, Mo.—The bids received on this contract (pp. 627, 707, 794), which provides for furnishing the various school districts in St. Louis with coal during the ensuing year, were as follows: BITUMINOUS—Devoy & Kuhn, $1.94¾; Polar Wave Ice & Fuel Co., $1.91¾ (O'Fallon coal); Bald Eagle Mining Co. (Winkle coal), $1.91¾. ANTHRACITE—Polar Wave Ice & Fuel Co., $7.47 on stove and $7.72 on chestnut; Devoy & Kuhn, $7.73 on stove and $7.98 on chestnut; the Boehmer Coal Co., $7.54 on stove and $7.79 on chestnut. This business usually has from eight to twelve bids offered on it, but the uncertainty prevailing in this district has restricted the number of bidders. Address Supply Commissioner, 3431 School St., St. Louis, Mo.

✚No. 475—Rock Island, Ill.—Sealed proposals will be received until 10 a.m., June 1, for furnishing the Rock Island Arsenal with coal and coke as follows, per gross ton: Anthracite, Lehigh egg, 100 tons; bituminous (blacksmith coal), 100 tons; mine-run bituminous, best quality, for delivery in lots of 100 to 200 tons, 5000 tons; Connellsville coke, selected, 72-hr., 50 tons; Solvay coke, 50 tons. Address Lieut. Col. Geo. W. Burr, Rock Island Arsenal, Rock Island, Ill.

✚No. 542—Harvey, Ill.—This contract (pp. 708, 834) will not be concluded at the present time, the company having decided to purchase its requirements for the time being in the open market. Address Pur. Agt. L. C. Curl, the Buda Co., Harvey, Ill.

+No. 631—Milwaukee, Wis.—The Gross Coal Co. was the lowest bidder on this contract (p. 795), which also provides for furnishing 1300 tons of coal to the North Point pumping station, in addition to the 1000 tons of Pocahontas for the high-service pumping station previously noted. The bid of this company was $2.975 per ton. The bid on the Pocahontas contract last year was on the basis of $3.60 per ton. Address Deputy Comr. of Pub. Wks. Percy Braman, Department of Public Works, Milwaukee, Wis.

+No. 674—New York—Bids on this contract (p. 795), which provides for furnishing and delivering 84,160 gross tons of anthracite and 4700 tons of semibituminous coal for the Board of Education, were as follows:

C. W. Mooers, Elmira, N. Y., offered to furnish 7500 tons Bernice free-burning No. 1 buckwheat, Borough of Manhattan, at $2.45 per ton f.o.b. Perth Amboy. He bid the same price for 2300 tons No. 1 buckwheat for Brooklyn, District No. 1, and 2350 tons same coal for District No. 1, Borough of Queens. He also offered this coal delivered on cars at Jersey City at $2.50 per ton.

Address Supt. of School Supplies Patrick Jones, Park Ave. and 59th St., New York City.

New Business

+No. 676—Hoboken, N. J.—Bids will be received some time in June by the Board of City Commissioners for supplying all of the city requirements, including the City Hall, fire houses, police stations, libraries, schools and all other city buildings. This is a radical departure from previous practice, when the City Council awarded all contracts in small individual lots. The contract will cover about 18 buildings, and will probably be awarded just prior to the closing of the schools. Address Board of City Commissioners, Hoboken, N. J.

+No. 677—Everett, Mass.—The Board of Education at this place will receive bids until May 28, for furnishing the fuel requirements at the local schools during the ensuing year. The approximate tonnages involved are: Anthracite, 2000 tons; bituminous, 1500 tons; screenings, 1000 tons. Deliveries are to be made in the bins of the various school houses. Address Chn. of Com. on Fuel, Charles Mauser, Bd. of Edu., Everett, Mass.

+No. 678—New Brunswick, N. J.—The local School Board will be in the market during either May or June for its annual requirements of coal. Last year stove, egg and chestnut were used, but the new contract will be for stove and egg alone. Stove and egg coal were purchased at $6.62 per ton last year, and nut at $6.81. The call for bids is advertised and the contract let to the lowest bidder. Address Secy. of the Board of Education Morris Bauer, New Brunswick, N. J.

+No. 679—Dayton, Ohio—The local Board of Education will be in the market during the latter part of May or the first of June for about 6000 tons of coal, which was bought at $3.10 to $3.35 per ton last year. Two-thirds of the tonnage is to be delivered during the summer period and the balance as required. The call for bids is advertised. Address Clerk of the Board of Education, Dayton, Ohio.

+No. 680—Utica, N. Y.—The Board of School Commissioners at this place will be in the market about June 1 for 3000 to 3200 tons of anthracite and bituminous coal. The current contract was negotiated on the following basis: Egg, $6.10; stove, $6.10; nut, $6.35; buckwheat, $3.60; bituminous, $3.50. The call for bids is advertised and the business let on a competitive basis. Address Secy. D. J. Kelly, Bd. of School Comrs., 13 Elizabeth St., Utica, N. Y.

No. 681—Toronto, Can.—The Upper Canada College at this place consumes annually about 1000 tons of soft screenings, the present contract expiring shortly. Bids will be received until July 1. Address The Bursar, Upper Canada College, Toronto, Can.

+No. 682—Apponong, R. I.—The School Board at this place will be in the market some time in June for a contract covering their annual requirements of coal involving from 500 to 600 tons of anthracite. White ash and Lehigh grades are usually bought, the price ranging from $6.80 to $7.05. The call for bids is advertised, and the business let to the lowest bidder. Address Clk. C. O. Carpenter, School Board, Aponang, R. I.

+No. 683—Perth Amboy, N. J.—The local School Board will be in the market some time during June for their annual fuel requirements involving about 1400 tons of Lehigh egg coal. The business is usually let at about $6.50 per ton. The call for bids is advertised. Address the School Board, Perth Amboy, N. J.

+No. 684—Morganton, N. C.—The Light & Water Plant at this place will be in the market some time during June for approximately 800 tons of coal. The present contract is held by the Stonega Coal & Coke Co., and provides for furnishing 3- to 5-in. "Rhoda" coal at $3.65 per ton in the plant. Address Supt. F. Jerome Wortman, Light & Water Plant, Morganton, N. C.

No. 685—Albany, Ga.—The Albany Power & Manufacturing Co. of this place will contract some time in June for approximately 2000 tons of coal. The present contract is being filled with 4 in. Jellico coal from the Tennessee and Kentucky fields at about $3.20 per ton. The call for bids is usually advertised. Address Purchasing Agent, Albany Power & Manufacturing Co., Albany, Ga.

+No. 686—Millen, Ga.—The City Light & Water Plant at this place will contract some time in June for their annual requirements of coal amounting to about 500 tons. It is understood that the business is not competitive. Mine-run coal is required. Address H. B. Davis, City Light & Water Plant, Millen, Ga.

+No. 687—Ketchikan, Alaska—The Lighthouse Department at this place will receive bids until 2 p.m. May 30 for furnishing about 1500 tons of coal, during the fiscal year 1915. Blank proposals and specifications may be had on application. Address Lighthouse Inspector, Ketchikan, Alaska.

No. 688—Vandalia, Ill.—The City Light & Power Plant at this place will be in the market some time during June for 2700 tons of screenings. The present contract was made at 70c. per ton, f.o.b. mine. The call for bids is usually advertised. Address City Clk. F. C. Chandler, Vandalia, Ill.

No. 689—Chicago, Ill.—H. W. Caldwell & Son Co. will be in the market about June 15, for one year's supply; 250 tons per week, of No. 3 Illinois or Indiana washed nut will be required. Address Purchasing Agent, H. W. Caldwell & Son Co., Chicago, Ill.

+No. 690—Port Huron, Mich.—Sealed proposals will be received by the Board of Education at this place until 2 p.m., May 26, for furnishing approximately 1200 tons of Pocahontas smokeless coal. Bids should cover the cost of delivery in bins at the various school buildings, and will generally be completed before Sept. 1. The ash contents must not exceed 7% and analysis of the coal must accompany all bids; nothing under 14,700 B.t.u. will be considered. A certified check for $300 must accompany each bid. Address Secy. Bd. of Edu. Loran C. Elliott, Port Huron, Mich.

+No. 691—Watervliet, N. Y.—Sealed proposals, in triplicate, will be received until 1 p.m., June 8, for furnishing the fuel requirements of the Watervliet Arsenal, during year ending June 30, 1916. Information furnished on application. Address Col. W. W. Gibson, Watervliet Arsenal, Watervliet, N. J.

+No. 692—Ottawa, Can.—The Board of Education at this place will receive bids until May 21 for furnishing the fuel requirements at the local schools during the ensuing year. Address Sec.-Treas. Crawford Ross, Public School Board, 222 Gilmore St., Ottawa, Can.

No. 693—Madison, Wis.—The University of Wisconsin is now in the market for their next year's coal requirements, amounting to approximately 20,000 tons of 2-in. screenings per annum. Bids will be received until May 18. Address Secy. M. E. McCaffrey, Regents Board, University of Wisconsin, Madison, Wis.

No. 694—Toronto, Ont., Can.—The Central Young Men's Christian Association building will be in the market until the middle of May for a supply of 1500 tons of soft coal. The contract is let on a competitive basis. Address, Superintendent of Buildings, Central Y. M. C. A., Toronto, Ont.

No. 695—Chicago, Ill.—The Brand Brewing Co. will be in the market about June 15 for a contract for one year's supply of coal; 8 cars per month of Illinois or Indiana steam lump will be required. Address Purchasing Agent, Brand Brewing Co., Chicago, Ill.

+No. 696—Salem, Mass.—The County Commissioners at this place received bids until May 10 for furnishing 2000 tons of steam coal and 100 tons of white ash and Franklin stove coal. Address Asst. Clk. James P. Hale, County Comrs., Salem, Mass.

No. 697—Chicago, Ill.—Rosenbaum Bros. will purchase from time to time on the open market 150 cars Illinois screenings. They will be in the market about June 15. Address Purchasing Agent, Rosenbaum Bros., Chicago, Ill.

No. 698—Toronto, Ont., Can.—The Toronto Public Library will receive bids until about the end of the month for 500 tons of semi-bituminous coal for heating supply. Pocahontas coal is usually bought and arrangements must be made for summer delivery. Address Secretary, Public Library, College St., Toronto, Ont.

+No. 699—National Soldiers' Home, Me.—Bids will be opened May 20 for 3400 tons bituminous coal, Georges Creek, Pocahontas, or equal coal, of good quality, dry and merchantable, in fair proportion of slack and lump, 2240 lb. to the ton. This coal is to be delivered in cargo lots alongside Home Wharf at Randolph, Me. (opposite Gardiner, Me.). Delivery to be during the time that navigation is open in the Kennebec River. The wharf will not accommodate vessels drawing more than 13 ft. under ordinary circumstances. Bids to be submitted on a form provided. Bids will also be opened on the same date for 800 tons of anthracite, egg, coal, and 200 tons of range size. The latter also to be delivered in cargoes alongside the Home Wharf, Randolph, Me., during the season. Address Maj. F. L. Appleton, Treas., National Soldiers' Home, Me.

No. 700—Louisville, Ky.—The Kentucky Paper Box Co., which consumes about 960 tons of coal annually, announces it is in the market for coal and is now testing out various grades to find one suited for the manufacturing of their products. At present, eastern Kentucky nut and slack is being used. Delivery is to be by rail on the company's terminal. Address Purchasing Agent, Kentucky Paper Box Co., Louisville, Ky.

+No. 701—Portland, Me.—Sealed proposals will be received at the office of the Lighthouse Inspector, Portland, Me., until May 20, 1915, for furnishing fuel for vessels and stations. Blank proposals and particulars may be obtained on application. Address Lighthouse Inspector, Portland, Me.

+No. 702—Peru, Ind.—The City Power Plant at this place will be in the market some time during June for approximately 6000 tons of coal. The business is done on a competitive basis, and Island Creek coal is usually bought. The approximate cost is 97c. per ton. Address Mgr., Arthur Herren, Electric Light & Water Co., Peru, Ind.

+No. 703—Lowell, Mass.—Sealed proposals will be received by the Middlesex County Commissioners until 10 a.m., May 17, for coal to be delivered as may be required. The requirements are: 150 gross tons of New River, 20 tons of Lackawanna broken, both of these for delivery at the Lowell Jail; 500 gross tons of New River, 20 tons of Lackawanna broken, 30 tons of the best stove coal, all of these for delivery at the Training School of North Chelmsford. A certified check for $200 must accompany each bid, and specifications and proposal forms can be obtained on application. Address County Commissioners, Middlesex County Court House, Lowell, Mass.

+No. 704—Cambridge, Mass.—Sealed proposals will be received until 10 a.m., May 18, for a supply of coal to be delivered at the East Cambridge House of Correction. About 3500 gross tons of bituminous, 50 tons of anthracite furnace and 25 short tons of anthracite stove coal will be required. A certified check for $200 must accompany all bids, and specifications and proposal forms may be had on application. Address Middlesex County Commissioners, Court House, East Cambridge, Mass.

+No. 705—Corning, Iowa—Sealed bids will be received until 8 p.m., June 2, for furnishing and delivering 200 tons of coal to the three local school buildings, as directed by the Board. Deliveries are to be made between Aug. 1 and 15 of the current year. Address Secy. Bd. of Edu. W. C. Chubb, Corning, Iowa.

+No. 706—New York, N. Y.—Sealed bids will be received until noon, May 20, for furnishing and delivering coal to the Armory Board, Bellevue and allied hospitals, departments of bridges, correction, fire, health, parks, in Manhattan and

Richmond, Bronx, Brooklyn, Queens, police, public charities, street cleaning and water-supply, gas and electricity, during the period ending Mar. 31 of the next year. Blank forms and further information may be obtained on application. For previous bids and awards on this contract see pp. 567 and 710. Address Contract Clerk, Room 1226, Municipal Building, New York.

✚No. 707—Sunbury, Penn.—The local Board of Education will receive bids until 6 p.m., May 21, for furnishing coal during the fiscal year beginning Sept. 1, as follows: Egg coal 465 tons; pea 69 tons; buckwheat 80 tons; stove 30 tons. Deliveries are to be on cars at siding and also into the cellars of the dfferent school buildings. Address Committee on Supplies, Sunbury School District, Sunbury, Penn.

✚No. 708—North Adams, Mass.—Sealed bids will be received until noon, May 15, for furnishing coal to the several public buildings at this place. Specifications as to quantities, delivery, etc., may be had on application. Address Com. of Pub. Wks. John Martin, North Adams, Mass.

✚No. 709—Lewistown, Penn.—The Board of Education at this place will receive bids until June 1 for furnishing and delivering in bins of the various school buildings about 200 tons of bituminous coal in addition to a very small tonnage of anthracite. Address Secy. J. J. Biemesderfer, Bd. of Edu., Lewistown, Penn.

✚No. 710—Detroit, Mich.—Sealed proposals were received until noon, May 11, for furnishing the City Poor with coal for the fiscal year beginning July 1. Specifications were on file at the office of the board. Address Secy. Harry S. Prenzlauer, Municipal Bldg., Detroit, Mich.

✚No. 711—Detroit, Mich.—Sealed bids will be received until noon, May 21, for furnishing the coal required for the County Poor Institutions at Eloise during the fiscal year beginning July 1. Both anthracite and bituminous will be required, and specifications may be viewed on application. Address Secy. Harry E. Prenzlauer, Wayne County Bd. of Poor Coms., Detroit, Mich.

✚No. 712—Boston, Mass.—Sealed proposals were received until 10 a.m., May 10, for furnishing 250 tons of coal for use at the local Immigration Station during the fiscal year beginning July 1. Complete details can be had on application. Address Commissioner of Immigration, Long Wharf, Boston, Mass.

Awards

✚No. 453—Fort Keogh, Mont.—This contract (pp. 627, 707), which provides for furnishing the Remount Depot at this place with about 750 tons of coal, has been awarded as follows: **Quintin Johnston, Jr.** (Chicago), Carney lump, 10.577c. per 1,000,000 B.t.u., f.o.b. Chicago; **Roundup Coal Mining Co.** (Roundup) mine-run, 18.73c. per 1,000,000 B.t.u., f.o.b. Fort Keogh. Address Depot Quartermaster Capt. Sam'l Van Leer, Fort Keogh, Remount Depot, Mont.

✚No. 475—Rock Island, Ill.—This contract (p. 628), which provides for furnishing the Rock Island Arsenal with coal for the fiscal year beginning July 1, has been awarded to the **Rock Island Fuel Co.** on the following basis: 6-in. bituminous lump, $3.57; anthracite nut, $9.14; stove, $8.71. Prices include cost of delivery to buildings at the station. Address Lt.-Col. Kenneth Morton, Ordnance Dept., Rock Island Arsenal, Ill.

✚No. 496—Malden, Mass.—This contract (pp. 665, 748, 707), which provides for furnishing the fuel requirements for the local Board of Education has been awarded as follows: **Locke Coal Co.,** bituminous, $4.44; anthracite furnace, $5.83; egg, $6.33; stove, $6.33; stove (in ¼-ton lots), $7.40; nut (¼-ton lots), $7.60. The **Malden Coal Co.** obtained the contract for nut coal at $6.57. Address Clk. of Com. John L. Gilman, City Hall Bldg. Malden, Mass.

✚No. 521—Front Royal, Va.—This contract (pp. 666, 707), which provides for furnishing the Front Royal Remount Depot with about 345 tons of anthracite coal, has been awarded to the **Commercial Coal Co.** of New York at $5.89 for egg and $6.14 for stove. Prices include cost of delivery. Address Depot Quartermaster, Front Royal, Va.

✚No. 560—Auburn, N. Y.—The awards on this contract (p. 709), which provides for furnishing the local school board with their annual requirements of anthracite egg coal, were: **Harlie J. Churchill** (Syracuse, N. Y.), 500 to 600 tons at $6 for spring delivery, 300 tons at $6.10 for summer delivery, and $6.25 for winter delivery. **Simmons & Rapalee** (Auburn, N. Y.), stove or egg or mixed stove and egg coke, 685 tons for summer delivery at $5, and 150 tons for winter delivery at the same price. Address Supt. of Schools, Henry D. Hervey, 144 Genesee St., Auburn, N. Y.

✚No. 567—Brookline, Mass.—This contract (p. 709, 748), which provides for furnishing the local city government with 2963 tons of anthracite and 2000 tons of bituminous coal has been awarded as follows: **Massachusetts Wharf Coal Co.,** furnace, $5.73; egg, $6.25; stove or nut, $6.50. **H. N. Hartwell & Son, Inc.,** buckwheat, $2.36. **E. Russell Norton,** bituminous, $3.45. Address Sec. of Bd. Edward A. McEttrick, Town Hall, Brookline, Mass.

✚No. 580—Union, N. J.—This contract (p. 749), which provides for furnishing the local Board of Education with its fuel requirements for the ensuing year has been awarded to the **Lehigh Coal & Supply Co.** of Hoboken, N. J. at the following prices: Pea coal, $4.24; stove, $5.67; nut, $5.94. Address Secy. Fred. Cortal, Bd. of Edu., Union, N. J.

✚No. 587—Cohoes, N. Y.—This contract (p. 749), which provides for furnishing the Board of Education at this place with approximately 400 tons of coal, has been awarded to **M. V. Van Santvoord** at $5.57 for egg coal, $5.57 for stove, and $5.34 for pea. There were four other bidders on this contract. Address Clk. Elmer E. Bell, Bd. of Edu., City Hall, Cohoes, N. Y.

✚No. 589—West Hoboken, N. J.—This contract (p. 749), which provides for furnishing fuel requirements of the local Board of Education during the ensuing year has been awarded to the **McCann Coal Co. of Jersey City,** at $5.70 per ton. Other bidders on this contract were: E. A. Kiesewetter, $6.01; James Coyle, Jersey City, $6.08; Isaac Jennings, $6.20; Consumers Coal Co., $5.59 for May delivery, $5.69 for June; $5.79 for July; $5.89 for August, and subsequent months $5.97. Address Secy. Alexis Benoist, Bd. of Edu., Hoboken, N. J.

Contract Notes

New York—The cost of unloading coal from vessels into elevated coal bunkers or storage piles has been reduced by the New York Edison Co., in New York City, from more than 25c. originally to not more than 2c. a ton. This, according to George A. Orrok, M. E., is the result of an extensive study of the question of coal handling on piers and involves mechanical handling equipment properly designed for this purpose.

Europe—Denmark and Sweden purchase almost all their coal from the United Kingdom, and the distance and high freight rates will handicap the American shipper in competing for this trade when conditions return to normal. But Sweden has bought some American coal during the last few months and has recently turned to Germany for coal and coke. France stands ready to purchase in the United States if prices can be arranged. Italy is threatened with a coal famine, and it is reported by cable from Madrid that Spain offers a market for American coal of all grades.

South America—Coal supplies have heretofore come chiefly from the United Kingdom, Australia and Germany; but the United States exporters have already begun to take advantage of present conditions to increase their sales. Markets for American coal in Europe, South America, Mexico, India and Egypt are discussed in Special Consular Reports No. 69, Foreign Markets for Coal, just issued by the Bureau of Foreign and Domestic Commerce, Department of Commerce, copies of which may be obtained, for 5c. each, from the Superintendent of Documents, Government Printing Office, Washington.

Spain—A royal decree of Apr. 7, suspends until further notice the import duty and transportation tax on coal, the exemption to apply to all shipments made to a Spanish port on or after the above date. The combined import duty and transportation tax on coal imported from the United States amounted to $1.06 per metric ton (2204.6 lb.). The Director General of the Spanish Customs Department has requested quotations of current prices for coal shipped f.o.b. and c.i.f. from the United States to Spain.

Greenville, S. C.—Press reports are to the effect that the South Carolina Cotton Manufacturers' Association has signed a contract with the Clinchfield Coal Co. for 350,000 tons of coal, the price being unofficially announced to be 85c. per ton. The cotton manufacturers are said to have effected important savings in their coal bills by this coöperative purchasing which is done by a buying committee consisting of three members. About 100 mills are said to participate in the buying.

Buffalo, N. Y.—The contract for furnishing the Buffalo schools with bituminous coal for the ensuing year has been awarded to **C. A. and M. Kaiser.**

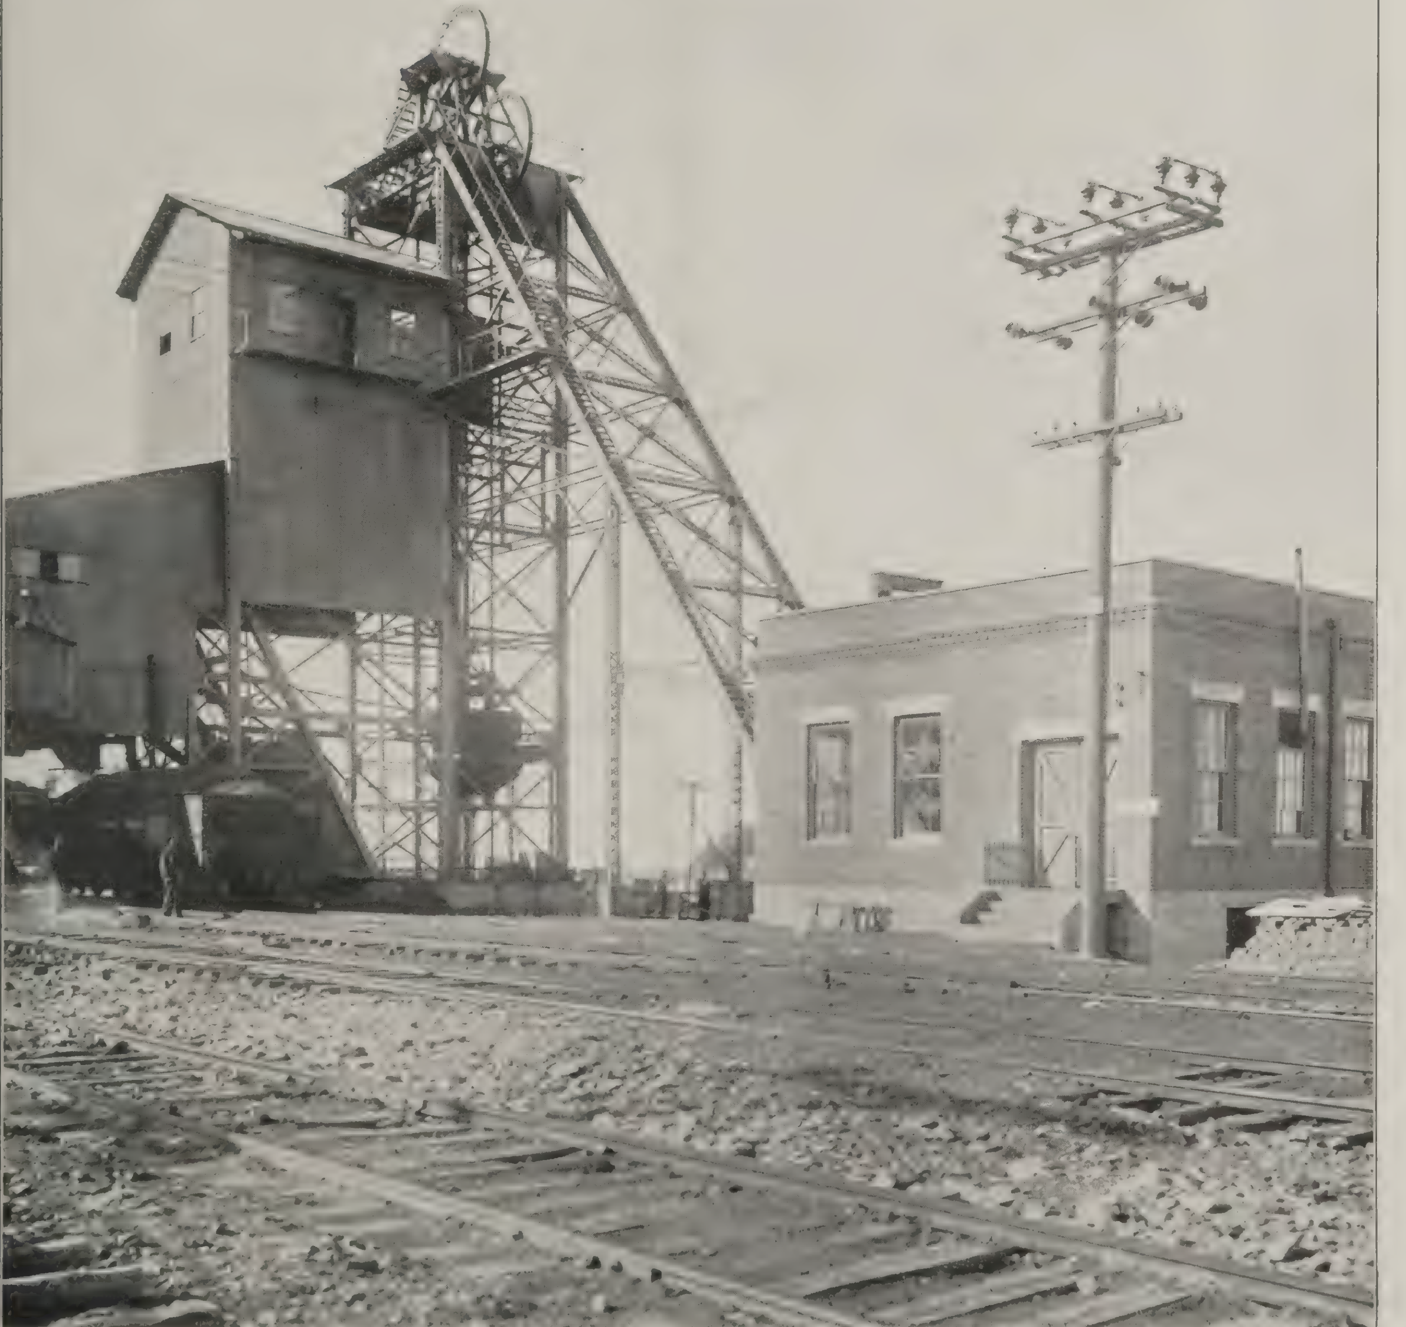
Peabody Coal Company's Plant at Kincaid, Ill.

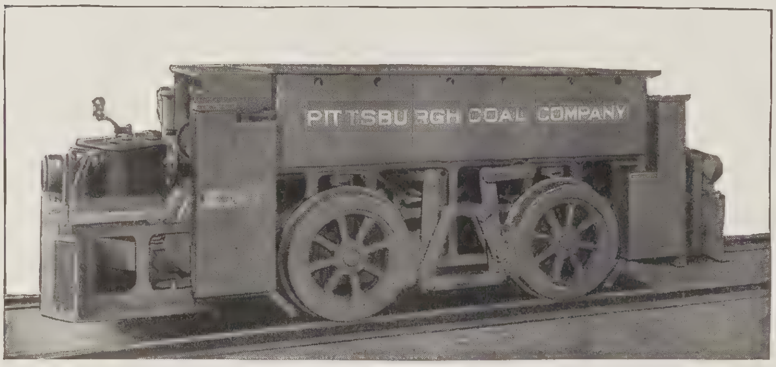
One of the Handsomest and Best Equipped Coal Mines in the Middle West



Why It Costs Less

to gather coal with

The Barsteel Storage Battery Mine Locomotive



It handles more cars on one charge—

Pulls less current from the battery—because it has

1. Five-point series-parallel control—Only two resistance points.
2. Low voltage battery motors—with highest efficiency.
3. Maximum drawbar pull—with minimum current.
4. No dead weight in frames.

Low Maintenance Cost—Secured by

1. Outside-hung motors—*accessible without removing battery.*
2. Open side frames—*Inside parts accessible without removing battery.*
3. Most rugged batteries made—*long life—minimum repairs.*
4. Spring-suspension of entire frame—*prevents jarring of battery.*
5. Best brake rigging—3 point suspension—Double brake shoe hangers—M. C. B. detachable Brake Shoes—Turnbuckle adjustment to keep full pressure on Brakes.
6. Barsteel frames—*Unbreakable.*

RUN-OF-MINE TALKS

ON YOUR BUSINESS AND OURS

By the Business Manager

"UNTIL you can prove to our satisfaction, by actual results at some mine, that your machine will do what you claim for it, you can't make those claims in the advertising section of Coal Age."

That's the gist of a letter we had to write to a man the other day. He has a mining machine for which he makes very extravagant claims, and perhaps they are true—if so, he should be able to prove them. However, his reply to our letter shows that we have made an enemy, but our solace is that by so doing we have protected 10,000 friends—our readers.

Advertising is business insurance both to buyer and seller.

A NEW version of the "do one thing at a time and do it well" maxim comes from Henry Ford. Says he, "If every man who manufactures an article would make the very best he can in the very best way at the very lowest possible price, the world would be kept out of war, for commercialists would not have to search for outside markets which the other fellow covets.

Advertised goods are good goods or they won't be advertised long.

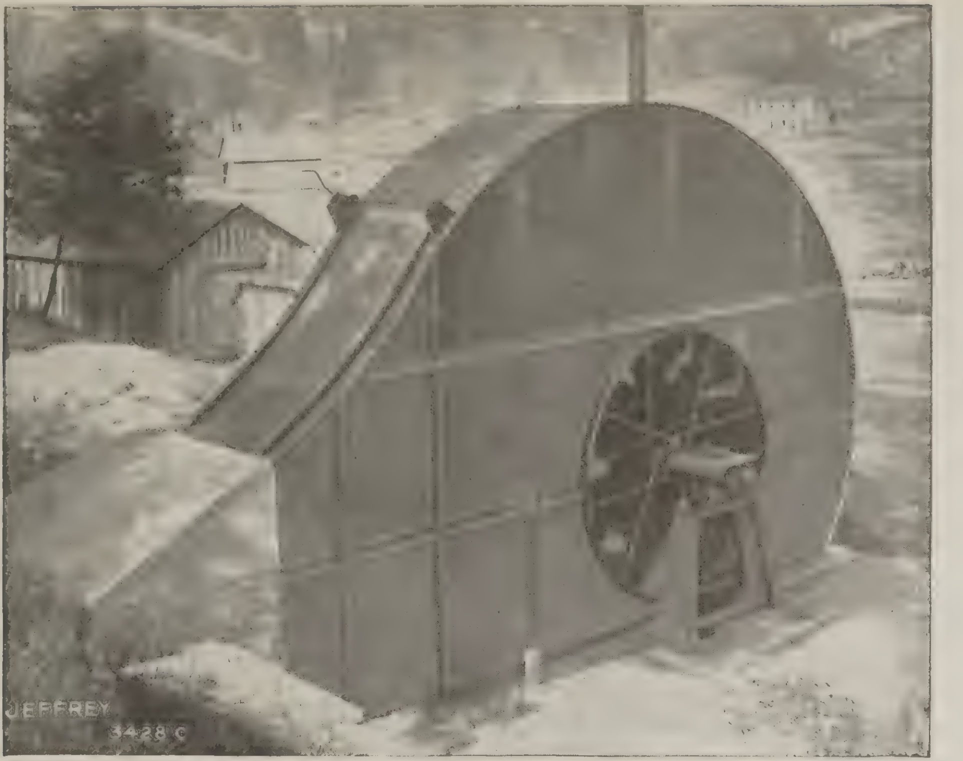
HAVE you ever come across the man who claims that he is never influenced by advertising? When such a person is encountered it is interesting to get beneath the surface of his statement in an endeavor to learn whether or not he actually holds to his cited opinion.

The writer met such a man the other day entering the subway.

Loudly proclaiming that he never paid any attention to advertisements, he took out a couple of subway tickets and was just about to drop them in the box when he discovered that they were green soda slips. Pressed for an explanation he acknowledged that he had purchased a dollar's worth of soda checks in order to get a thirty-five cent tooth brush which was thrown in as a special advertising offer. This was the man who had always claimed that advertising never influenced *him*!

Are you getting ALL the value from Coal Age? Are you reading the ads?

F. S. SEAGRAVE, General Manager of the Eldorado Coal and Mining Co., Eldorado, Ill., is a believer in advertising. He says: "We get much valuable information from the advertising pages of Coal Age, as well as from its news and editorial columns. We look over the advertising pages to see if we can find such articles advertised as we may be in the market for from time to time."



There's No Better Investment You Can Make

Than by Equipping Your Mine with a

JEFFREY STEPPED MULTI-BLADED FAN

It's a Safe Insurance against Accidents, and brings returns in the Increased Efficiency of Mine Employees, Increased Production and Lower Maintenance Costs.

If you are still using a wooden-housed fan, a constant source of danger, why not replace it with a fire-proof up-to-date equipment of Jeffrey design. Possibly a smaller fan than the one you have will do the work more efficiently and at much less cost.

For Dependability, High Efficiency, Low Cost of Installation and Maintenance, Minimum Power Consumption—**Jeffrey Centrifugal Mine Fans** stand at the top of the list.

Jeffrey Bulletin No. 126-A-12 is a very interesting book on the subject of Mine Ventilation that every mine operator ought to have. Send for a free copy.

The advice of our EXPERTS is free. Why not let them assist you in solving ventilation problems, as others are doing?

Jeffrey Mfg. Co., 912 North Fourth Street, Columbus, O.

5-22-15

A Good Form of Mine Insurance.

By the use of permissibles you reduce the expense for timbering; you guard against the destruction of property; and you safeguard the lives of the men who work in your mine.

Many of the largest and most efficiently managed mines use **Red H** or **Xpdite,** the Hercules Permissibles.

Regardless of the conditions under which your mine is worked, or the nature of coal produced, some one of the different grades of these two Permissibles will meet your needs.

Prompt deliveries are made possible by the locations of our mills and magazines.

Write for our booklet "Hercules Permissible Explosives." You will find it interesting and instructive.

HERCULES POWDER CO.

Wilmington, Del.

COAL AGE

Vol. 7 NEW YORK, MAY 22, 1915 No. 21

Commissary Buying

Do you run a commissary or several of them as a necessity in connection with your mining operations?

WE say "as a necessity" because the best managers are learning that it does not pay in the long run to place the profits from the company store ahead of those derived from the main business of mining and selling coal.

But the commissary is a necessity in localities remote from towns in order to provide a place of trade for the mining community. Also many companies are forced to continue the policy of conducting company stores where the mining operations are in proximity to towns and cities. The reason for this is found in the fact that the average merchant has not yet learned the Golden Rule and persists in charging too much for life's necessities and then issuing garnishments to get it.

So the company store is still an institution of the mining industry. However, it is being conducted by every wise executive as a help to the employees and their families rather than as a money-maker for the company. The latter policy will not pay in the end; and we say it with pride that a goodly list of companies, large and small, could be noted here whose policy in the operation of commissaries is to make them purely self-sustaining community stores, furnishing the very best goods at prices that are right and fair to all. The conduct of such stores is a credit to the companies owning them.

But this kind of company store, much more than those that are operated only for profit, requires *real management.* Good business sense is essential to conduct a store in which the chief consideration is not to make money, but which still must in no sense savor of paternalism. At the same time the element of cost must be considered, and sound judgment demands that no more capital than is necessary be tied up in stock; for this after all, from a financial standpoint, is the chief asset and liability of any mercantile establishment.

To keep stocks of sufficient quantity without getting overstocked is a problem involving two big factors—*buying right* and *selling right.*

As to buying: Too many concerns allow their storekeepers to be buyers while at the same time maintaining a centralized purchasing department. The stores swarm with drummers and salesmen, some of whom could sell patent rights in washing machines to Hetty Green, much less the average commissary storekeeper. The first thing to do here is to centralize your commissary buying. Let the purchasing department do it all, and keep the drummers out of the stores. You'll be surprised how quickly the volume of orders will decrease and how fast your excess stocks will be depleted.

As to selling: When you've bought right, you'll find the selling problem is wonderfully simplified; in fact, it almost takes care of itself. When your storekeepers can't buy stuff they really don't need, the surplus simply isn't there to sell—and that's all there is to it.

This suggestion about buying is one with meat and money in it for any concern operating a company store. Try it and see.

Rotary Transforming Equipment for Coal-Mining Work

By Thomas Robson Hay*

SYNOPSIS—There are three types of rotary transforming or converting equipment. Each type has its own advantages and disadvantages, which are here discussed.

In considering the application of central-station power to coal-mining work it is necessary to use care in making the selection of the proper equipment to convert the alternating current supplied by the central station to direct current for use in the mine.

Three types of rotary transforming equipment are available—(1) rotary converters, (2) synchronous motor-generator sets and (3) induction motor-generator sets. The following is a comparison of the relative merits of the several types of equipment.

The overall efficiency of the synchronous motor-generator set is about 4 to 7 per cent. less than the overall efficiency of the rotary converter, while the overall efficiency of the induction motor-generator set is about 2 per cent. less than that of the synchronous motor-generator set. In fact, when the character of the load, which may vary from practically zero to more than full load almost instantaneously, is taken into consideration, it will be found that the difference in efficiency between the synchronous motor-generator set and the rotary converter with transformers will be slight.

In large installations where a great number of rotary transforming units are necessary it may be found that the theoretical difference in efficiency between the rotary converter with transformer and the synchronous motor-generator set may apparently have a considerable effect on the power consumption as indicated by the meter, but before making a definite selection careful consideration should be given not only to the theoretical full-load and fractional-load efficiencies, but also to the varying character of the load, with its consequent effect on the efficiency and regulation of the equipment, to the cost of upkeep and attendance and to the relative factors of simplicity and reliability.

The operation of the rotary converter on 60-cycle power is not as satisfactory as that of the synchronous motor-generator set or the induction motor-generator, except under unusually good regulation of the source of energy and when machines of comparatively small size are used. With the large machines it is necessary to select a slow speed equipment on account of the necessity of keeping the peripheral operating speed of the commutator within safe limits, and this necessity actually affects the comparative first cost.

A Substation Showing 2200-Volt Lightning Arresters of the Outdoor Type

Such limitations are not present in either the synchronous or induction motor-generator set and exist to a less degree in the rotary converter when operating on 25-cycle circuits. While the regulation of the voltage and frequency in most stations is good, it is not exceptionally so in long transmission systems operating under the severe conditions imposed in coal-mining work.

Synchronous Motor-Generators Are More Stable

Synchronous and induction motor-generator sets are considerably more stable, even when operating on wide ranges of voltage and frequency variations, than are rotary converters. Sudden overloads have a much greater effect on rotary converters than on synchronous and induction motor-generator sets owing to poorer speed regulation on varying voltages. The rotary converter is more apt to flash over, especially on high momentary overloads because of grounds and short circuits, and is also more likely to hunt than is the synchronous motor-generator set.

A more skillful class of attendant is required for the operation of rotary converters than for motor-generator

---

*No. 4506 Fifth Ave., Pittsburgh, Penn.

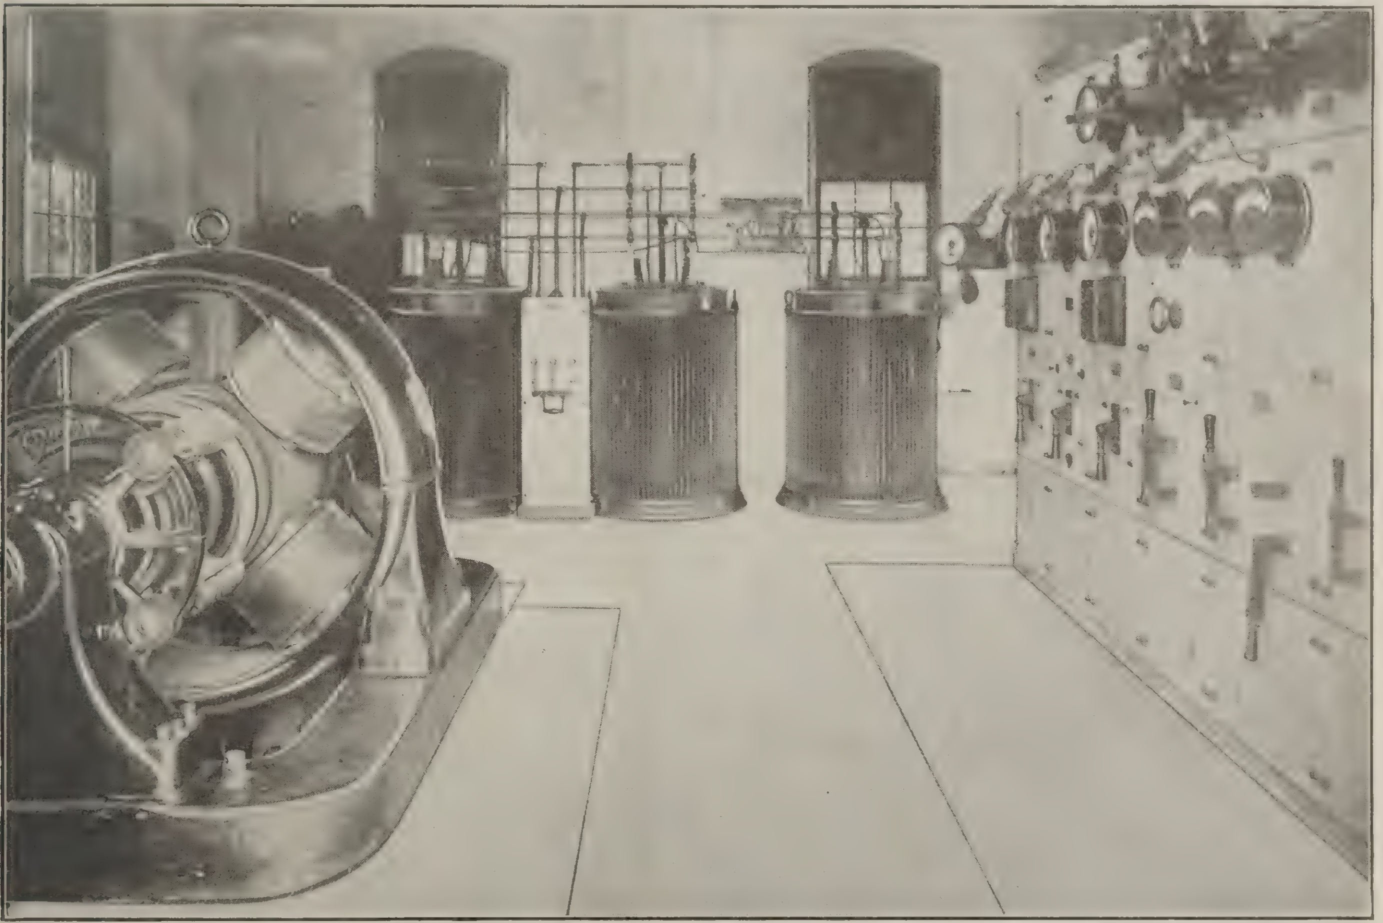
sets. This is owing largely to the operating characteristics of the machines, such as the necessity for synchronizing when starting and also on account of the peculiar features of the direct-current circuit when supplied from this type of equipment. The general absence of mechanical and electrical characteristics of simplicity and stability of operation under varying conditions of load, voltage and frequency are unfavorable features of rotary-converter installations. This is especially true when the sudden and more or less frequent and sustained heavy overloads that are too often present in coal-mining work are encountered.

The performance of the rotary converter when the supply circuit is subjected to transmission-line surges due to broken insulators and grounds is not nearly as satisfactory as that of the synchronous motor-generator set, and flashovers result, with consequent burning of the brush-holders and commutator. On account of the substantial design and construction of motor-generator sets and also on account of their much greater flywheel effect the adverse conditions brought about by grounds, heavy momentary or sustained overloads and line surges are much more efficiently and satisfactorily handled.

Rotary-converter equipment, including the rotary itself, transformers, starting devices, etc., is much more complex than are motor-generator sets, and a more experienced and intelligent operator is required. This matter of attendance should be given due consideration when the selection of the rotary transforming equipment is made. Satisfactory operators of any kind are scarce around most coal-mining operations, and efficient, intelligent ones are few, far between and hard to keep.

The regulation of the direct-current voltage of motor-generator sets is independent of the presence of motors on the alternating-current side of the power supply and has no appreciable effect on the power factor of the supply voltage if the available power-factor correction is applied. The regulation of the direct-current voltage of the rotary converter is possible, but change of the direct-current voltage causes change of power factor in a self-excited equipment.

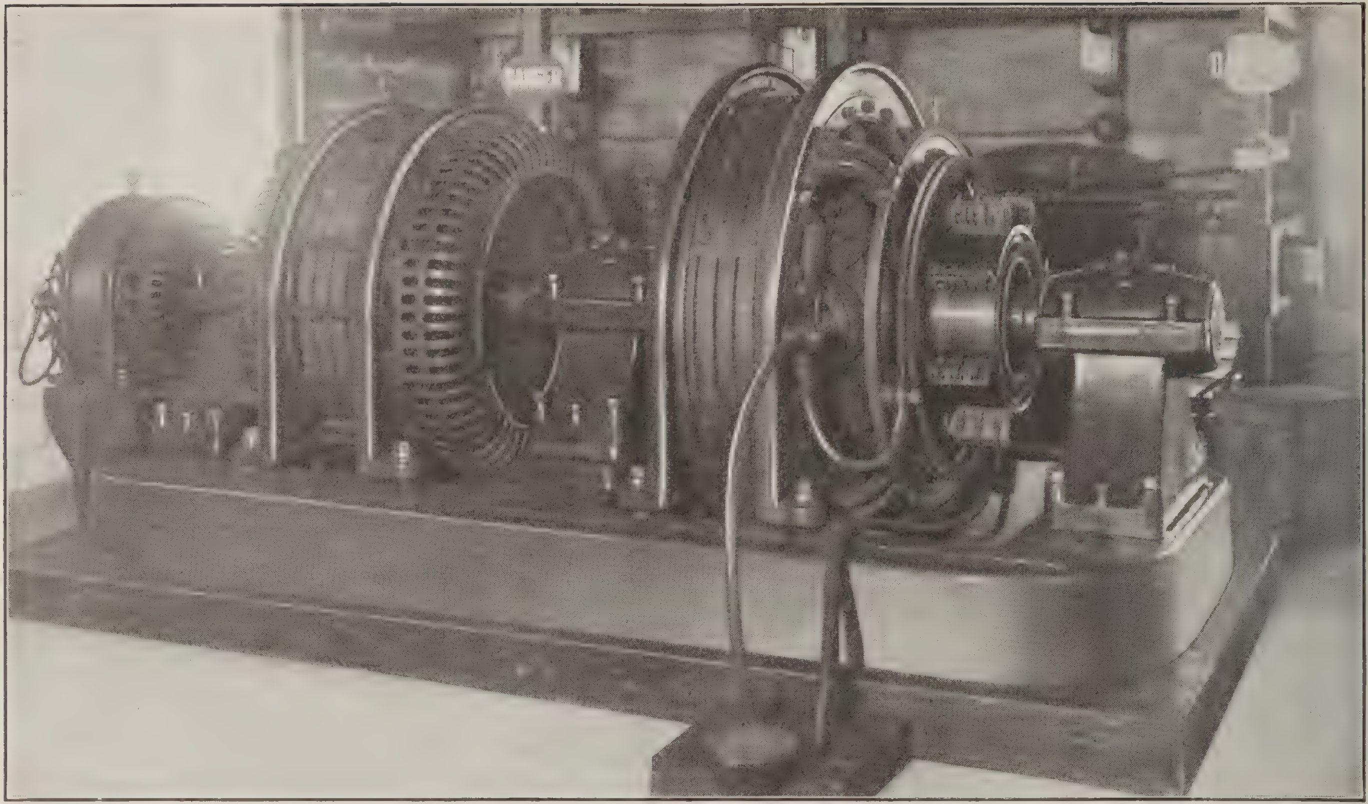
As a result the desired direct-current voltage may not at all times bring about the desired power factor in the alternating-current supply circuit. Except for the comparatively slight amount of compounding possible in a rotary converter, the direct-current voltage is directly dependent on the alternating-current voltage and is always in a definite ratio to it. The addition of a synchronous booster or of other methods of increasing the direct-current voltage acts to increase the initial cost of the installation and to further complicate the equipment.



AN ALLIS-CHALMERS ROTARY CONVERTER IN A SUBSTATION OF THE H. C. FRICK COKE CO.

ALTERNATING- AND DIRECT-CURRENT VOLTAGES ARE INDEPENDENT

Regulation of the power factor of the alternating-current supply can be effected with both the rotary converter and the synchronous motor-generator set, the power-factor regulation with the former causing changes in the direct-current terminal voltage, owing to the resulting change in line drop, while with the motor-gen-



Synchronous Self-Starting Motor-Generator Set, Meadowlands Coal Co., Arden, Penn.

erator set, the alternating- and direct-current voltages are entirely independent of each other.

Because of the electrical characteristics of the induction motor-generator set, this type of equipment will always have a varying, lagging power factor, which will in turn cause a lag in the power factor of both the transmission line and of the power-station equipment and will act to decrease the capacity of all apparatus from the source to the point of delivery of the power.

This unfavorable feature of the induction motor-generator installation is not inherently capable of correction. This statement would also be true of the synchronous motor-generator set did it not possess an electrical feature permitting of improvement of the power factor through overexcitation of its fields from a separate source of direct-current power. This power-factor improvement can be made as great as desired, but it has been found that an attempt to improve the power factor of the supply circuit when taken from a transmission line to a point much above 95 per cent. lagging is not economically desirable, as the cost of doing so is out of all proportion to the advantage gained.

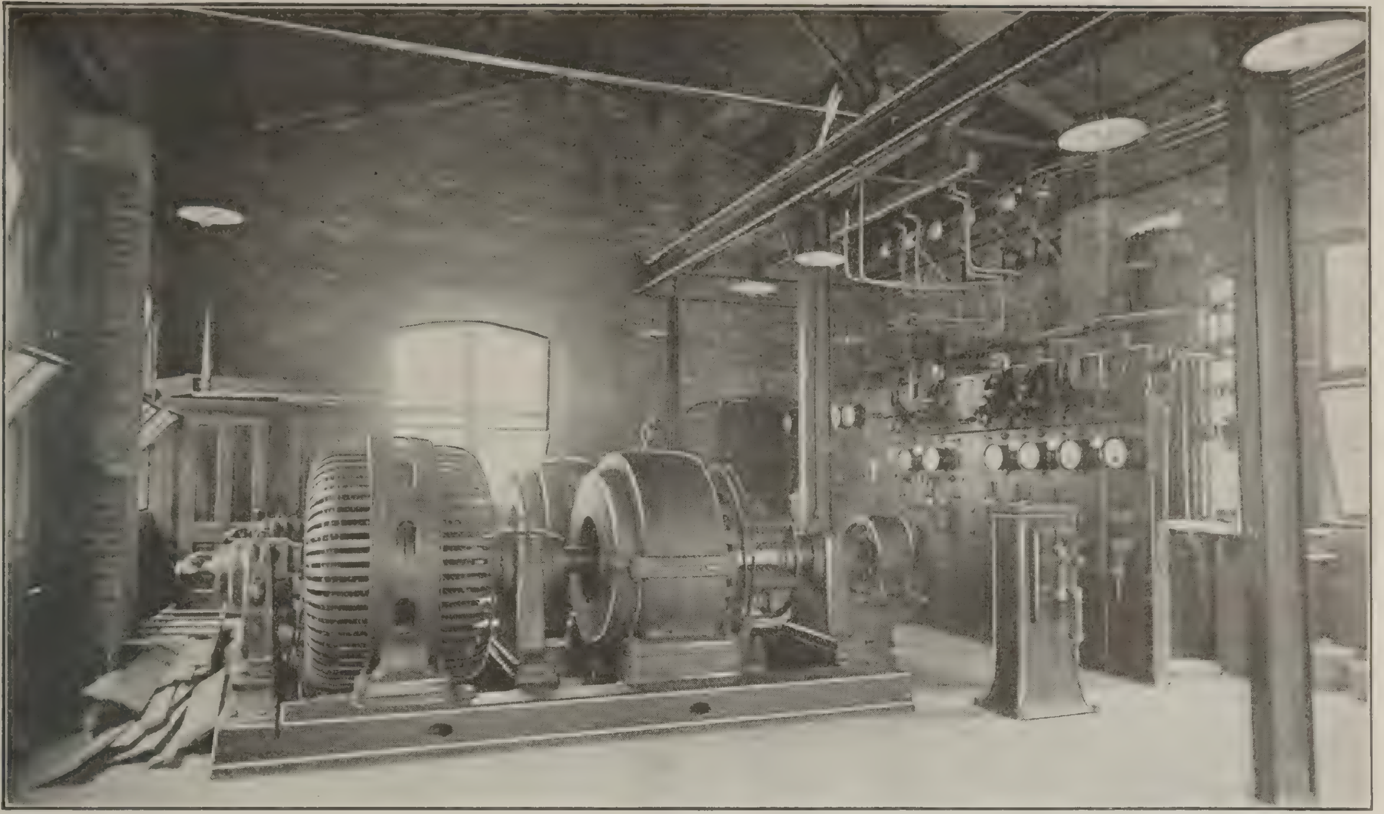
Power-factor correction as high as is economically possible is desirable because of the resulting increased overall efficiency of the equipment operating on the particular system and the increased power capacity of this equipment. By raising the power factor of a system the capacity of the transformers, transmission lines, and equipment operating thereon is materially augmented owing to the decreased flow of wattless current and consequent decreased losses, which increase as the power factor decreases.

Both the rotary converter and the synchronous motor-generator set can be made to operate at unity power factor, but it should be remembered that this is not the power factor of the system, but of the machine itself. The power factor of the system will depend largely on the compensating, or corrective, features available, the motor-generator set giving the best and most stable results. On account of the better compounding characteristics of the synchronous motor-generator set, this machine can be designed to furnish a leading power factor for all loads much in excess of the rotary converter, while at the same time retaining other desirable operating features.

The cost of the rotary converter complete, including reactance, transformers, oil and starting equipment, will be slightly less than that of the synchronous motor-generator set when the switchboard is included, but the cost of maintenance will be no less and if anything greater. If the operating characteristics of the installation, such as wide voltage and frequency variations, require the addition of accessory equipment to obtain satisfactory operation of the rotary converter the cost will be made to equal or exceed that of the synchronous motor-generator installation.

The cost of the induction motor-generator set would be about the same as the cost of the synchronous equipment, but it has not been favorably considered for coal-mining work, as it does not have sufficient points of advantage over the rotary converter and the synchronous motor-generator set to offset any decrease in first cost together with its less complicated operating characteristics.

The induction motor-generator set operates at an inherently constant speed under varying loads, but with a low power factor which decreases with decrease in load. Its power factor, as before mentioned, is not capable of alteration, and in starting it draws a large current from the line, which tends to affect the alternating-current distribution system clear into the power station.



Synchronous Motor-Generator Substation of the Clinchfield Coal Corporation

In the case of the rotary converter, the secondary alternating-current voltage of the transformers must be in a fixed ratio to the direct-current potential, which for mining service is usually 250 volts, and thus the transformer secondary voltage is not one that is standard for alternating-current motors and necessitates the use of a special voltage motor or an extra bank of transformers to furnish a standard potential for any motors that may be in use about the mine, such as on pumps, fans, tipple machinery, etc.

The impressed voltage for motor-generator sets can be a standard motor voltage for 4000-volt installations, Y-connected 2300-volt motors insulated for 4000-volt operation being used. If the transmission voltage is anything below 4000 volts it is of course possible to use a standard motor of the given voltage, whether a rotary converter or motor-generator set is selected. No additional transformers are required, however, when a motor-generator of a voltage of 4000 and below is employed.

It is of course permissible to use transformers with standard motor voltage secondaries by introducing reduced voltage taps to supply the proper potential for the rotary converter. This method of procedure, however, will affect the efficiency and regulation of the transformers, the resulting unstable regulation in turn affecting the voltage regulation of the rotary converter and the overall efficiency and cost of operation of the equipment.

Generally speaking, it is advisable, where the primary voltage exceeds 4000, to use two banks of transformers for rotary-converter installations, whereas only one bank, and sometimes none, is required for a motor-generator installation. Motor-generator sets operating on 6600-volt circuits and higher are possible and have given satisfactory results, particularly in the larger sizes, but the use of small- or medium-sized induction motors operating at such a comparatively high pressure is not satisfactory due to the excessive amount of insulation, with decreased motor efficiency, necessitated by the use of this voltage. It is better practice to make the transformed voltage of such a value as to enable the use throughout of standard and efficient equipment.

The features mentioned in the foregoing alter the several first costs and favor the motor-generator as regards space economy.

Independent Field Excitation Is Necessary

With the synchronous motor-generator installation, field excitation for the motor from an independent source is necessary. This source can be either the direct-current generator of the set, the synchronous motor fields in this case being wound for 250-volt excitation, or a belt-driven or direct-connected exciter delivering 125 volts. The former is to be preferred as it decreases the initial investment by the cost of the exciter and belt and economizes in space.

For equipment supplying energy to a 500-volt mine circuit, separate excitation of the field of the synchronous motor by means of a separate exciter is necessary. Most direct-current generators for mining work are compound wound with 10 per cent. overcompounding from no load to full load. By exciting the synchronous motor fields from the direct-current side of the set, the field strength automatically increases with the load, maximum excitation being obtained at full load. Setting the field rheostat for a given excitation at no load, that at full load, and therefore the power factor, can be closely predetermined and the correction made automatic for all percentages of load.

The 10-per cent. overcompounding, which is common on motor-generator sets for coal-mining service, is of decided advantage when the excitation is taken from the direct-current side of the set. The usual practice is to so proportion the synchronous motor that a 10-per cent. increase in field current will maintain approximately the same power factor at all loads, with resulting constant line voltage and frequency.

This feature has an interesting and valuable effect when the set is installed at the end of a long line on which there is more or less lighting. On such lines the transmission voltage is usually high at no load in order that it may not drop too low at full load or on overloads. Under these conditions the power factor of the motor-generator set will be unity or slightly lagging at no load or on light loads and will lead on the heavier loads. This action has a strong "steadying" effect, tending to decrease the no-load and to hold up the full-load voltage. With alternating-current induction motors installed for fans, pumps, tipple machinery, etc., this "steadying" effect is especially valuable.

The desirable features enumerated above are not possessed by the rotary converter to nearly as great an extent as by the synchronous motor-generator, since it is not possible to raise the direct-current exciting voltage in as automatic and satisfactory a manner on account of its dependence on the impressed alternating voltage. In fact overcompounding of the rotary converter has a bad effect on the power factor and is not generally considered advisable.

When it is decided to use a motor-generator set, the initial investment is capable of reduction to a minimum on account of the possibility of using the old direct-current generators in the isolated plant, providing they are of the belted type as the direct-current element of the motor-generator set. To this end they may be either belted or direct connected, preferably the latter.

Direct connection in most cases requires a comparatively slow-speed machine, as most belt-driven generators used in coal-mining work have a speed rating varying from 500 to 600 r.p.m. A synchronous motor of this speed is more expensive than a higher-speed motor of the same capacity, but in considering this application it must be borne in mind that a direct-connected set is more efficient on account of the elimination of belt losses and requires much less floor space than a belted set. The cost of a belt will be about the same as or more than that of a suitable flexible coupling. In either case the machines should be mounted on concrete foundations.

It may be found after a full investigation that the cost of a new two-unit direct-connected high-speed set will be but little more than that of a slow-speed synchronous motor with coupling for direct connection. Furthermore, besides obtaining all of the advantages of the made-up direct-connected outfit, the latter will possess the additional advantage of being new and decidedly more efficient.

The interruptions to service when the rotary converter is used will be greater than when motor-generator sets are selected, owing to the former's greater sensitiveness to suddenly varying loads and to prolonged overloads. In case of a burn-out on a rotary converter the whole machine is useless, whereas with a motor-generator set it is possible to make a temporary arrangement pending the repair of the damaged part on account of the fact that this equipment consists of two separate elements. This, in conjunction with the independent voltage and power-factor regulation, is usually considered of such an advantage as to more than offset any difference in first cost and operating efficiency and to justify the use of a motor-generator set.

This type of equipment also has the additional advantage that no collector rings carrying high currents and requiring careful insulation are present as is the case with the rotary converter. This feature will tend to decrease the upkeep on the alternating-current side of the motor-generator set. Such an installation is also somewhat more stable and satisfactory for parallel operation.

Fans and Pumps Should Be Driven by Alternating Current

In determining the necessary capacity of the rotary transforming equipment, it should be the business of the interested parties to install where possible alternating-current motors on such machines as fans, pumps, hoists, slope hauls, etc. The use of alternating-current motors taking power from the transmission line or from the secondaries of the high-tension step-down transformers obviates the transformation losses that occur in the rotary transforming equipment, thereby reducing the power bill to a minimum. This also reduces the size of the rotary transformer, and therefore the initial investment, and tends to make the overall cost of operation a minimum.

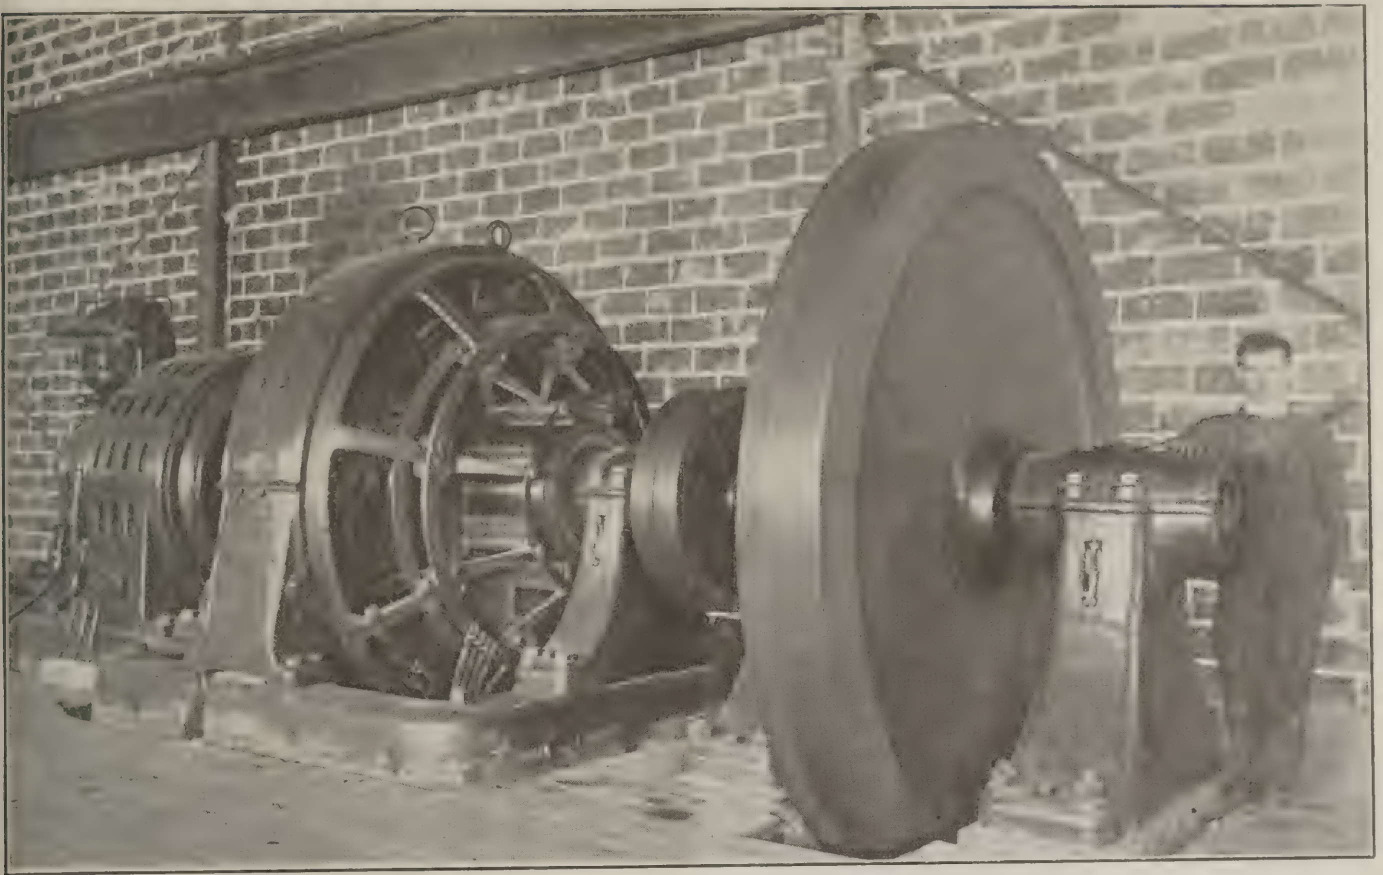
In cases where it is necessary to use motors for hoisting, either in shaft or slope, the use of alternating-current motors throws the wide fluctuations of current and voltage that frequently occur onto the transmission line, where they are more easily taken care of than when a direct-current motor is used taking its power from the direct-current side of the rotary transformer.

Inasmuch as the power is usually metered on the alternating-current side of the rotary transformer, a considerable saving in cost of operation can be made by placing as little equipment as possible on the direct-current circuit. This saving will usually be found to more than compensate for the increased cost of installation. The steadier the direct-current voltage, the fewer will be the burn-outs and the higher the efficiency of the equipment operating on the direct-current side.

In order to utilize central-station service to the best advantage and to keep the power cost to a minimum, the rotary transforming equipment should be located as near the center of distribution as possible. On account of the ability to place the rotary transforming equipment at any convenient point, such a condition can be obtained at minimum expense; and from time to time as the changing conditions seem to make it advisable the set may be relocated so as to give the most economic and efficient arrangement possible and at the same time accomplish the desired result.

If the cover is not too great it is usually best to select a surface location for the installation of equipment, taking the direct-current feeder wires down through bore holes to the selected point of distribution inside the mine. When the set is located on the surface it should be placed if possible so as to make unnecessary the devotion of the entire time of an attendant to its operation.

The set may also be located inside the mine, but such procedure is not generally recommended on account of



A Flywheel Induction Motor-Generator Set in Plant of the Christopher Coal Co., Christopher, Ill.

the dirt, the fire and water hazard and also on account of its general inaccessibility. If so located, however, the equipment should be installed in a moisture- and fireproof concrete room. Either solid or stranded copper cable wound with varnished cambric insulation of the proper quality and thickness and with a triple-braid, impregnated, weatherproof covering may be used to convey the current to the machine.

This wire will be suspended at the top of the hole on a tripod, set in a concrete foundation. The economics of the application will be largely determined by the conditions of roof and bottom, presence of water or gas, distances from the working-face, main parting and pitmouth, fire hazard, attendance, etc. No set rules can be laid down, but each case should be thoroughly gone over and the application made on the merits of the investigation.

The transmission and distribution system inside the mine should be made as efficient as possible. Rail-bonding should be in first-class condition with cross-bonding at intervals of 200 or 300 ft. All bonds should be inspected frequently. The feeder and trolley wires should be securely put up and care taken that there is no leakage and that the wire used is of ample capacity to handle the load without excessive loss.

The losses due to poor bonding and feeder-line construction may, and in many cases do, materially affect the efficiency and upkeep of the electrical equipment as well as the output of the mine and may make an appreciable difference in the power bill. Excessive use of sand by the locomotive drivers should also be guarded against as a considerable amount of power may be consumed in this manner.

Summary

In summation, it may be said that—

1. The synchronous motor-generator set, while slightly higher in first cost and lower in theoretical overall efficiency than the rotary converter, is simpler and more reliable in operation.

2. By means of the synchronous motor-generator set any desired power factor can be readily and satisfactorily obtained without the addition of any special features to the equipment.

3. With the synchronous motor-generator set, interruptions to service are a minimum, voltage and frequency variations are less harmful to the continued satisfactory operation of the set and the direct-current voltage can be adjusted to any desired value, irrespective of the fluctuations within reasonable limits of the alternating voltage.

4. The synchronous motor-generator set is easier to operate than the rotary converter and is more reliable under the severe conditions imposed by a coal-mining load.

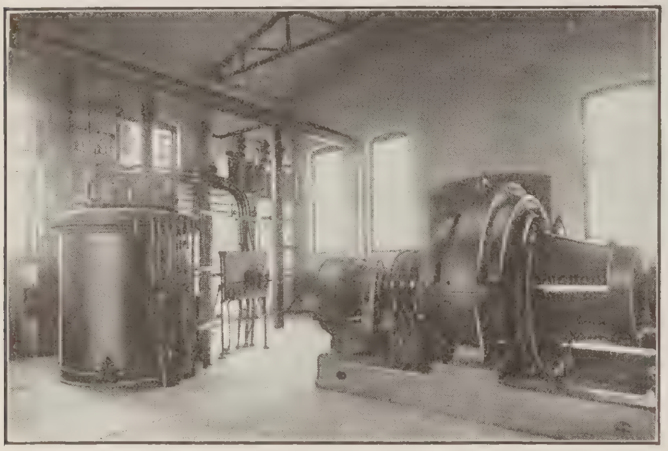
5. The use of the synchronous motor-generator set when taking power from the secondaries of high-tension stepdown transformers enables the use of standard alternating-current motors about the mine taking power from these same transformers and without any special features.

6. On account of the increased capacity of the equipment and the decreased line losses, because of the possibility of adjusting the power factor to any desired value, the central stations usually give a discount for the use of synchronous equipment. This feature, which is common to a greater or less extent in both the rotary con-

verter and the synchronous motor-generator set, enables the consumer to make a saving in the cost of operation, which in large plants may be considerable, thereby compensating for any increased first cost of installation.

It should be remembered that the power-station attendants available at most coal mines do not possess much technical information and that what they have is usually confined to direct-current equipment. Motor-generator sets which combine features of simplicity and reliability in operation, good economic and operating characteristics and practically fool-proof construction should therefore favorably recommend themselves to coal-mining operators.

Reliability and simplicity, combined with reasonable first cost and cost of operation, are the desired results. Selection and application of the equipment to be used should be made only after the proposition has been carefully considered in all its related phases and full and just consideration given to the various features favorable and unfavorable to be found in the different types of equipment available. Every application presents a problem in itself and requires its own individual solution. No hard and fast rules can be either laid down or followed.



A Westinghouse Six-Phase 25-Cycle Synchronous Rotary Converter

⁂

Burn Your Dynamite Cases

When dynamite is spread on the ground, so that as large a surface as possible is exposed, it generally burns peacefully on ignition and does not explode. The presence of metallic articles, such as wire and nails (and of course blasting-caps), makes an explosion likely. It is essential when destroying dynamite to remove it from the wooden case because of the nails by which the latter is held together.

Dynamite cases should be burned separately from the dynamite, because when they become saturated or stained with exuded nitroglycerin they almost always explode when burned; but if no dynamite is placed in the bonfire the explosion is generally not sufficiently severe to do any damage.

To set fire to the boxes, soak some excelsior or waste in gasoline and put one end of a piece of fuse in this, being careful to light the other end first. Have the fuse two or three feet long and the waste or excelsior under the empty dynamite cases. Or you can lay a train of excelsior and light one end with a match and run.

Dynamite cases showing any signs of being stained should never be used for fuel, but should be promptly destroyed in the manner described. If they blow up in the open, with everybody at a safe distance, they will do no harm, but if they blow up in the kitchen stove probably somebody will be badly hurt or killed and the house burned down. Don't take any chances.—E. I. du Pont de Nemours Powder Co.

⁂

Extracts from a Superintendent's Diary

The arrival of two salesmen at our camp today, loaded down with electric mine lamps for demonstration purposes, has recalled to my mind that styles have been changing even in miners' lamps. Leaving safety lamps out of consideration, the electric lamp is the fourth system of mine illumination to have a vogue during the 15 years that I have had occasion to keep posted on such matters.

First we had lamps to burn miners' oil, then "sunshine," then carbide and now electricity. Each change has called for a liberal supply of demonstrators, and there have been times when these salesmen added considerably to the income of our camp's boarding-house.

The methods employed by the manufacturers for the introduction of each of these systems have been very much alike. First the salesmen work on a few of the most progressive men until they get their curiosity aroused to a point where they are willing to make a trial. While the agent is on the ground the test is very satisfactory; after he leaves his pupils begin to have trouble, and finally so many of their associates have remarks to make that they decide pioneering isn't worth while. Shortly thereafter in some unaccountable manner the new system begins to make converts, and in the end everybody adopts it; the last ones to come over are the ones that first took an interest in the new light.

When I was young at the mining business I didn't take kindly to experiments, and the agents who tried to get me weaned from miner's oil had an interesting time of it. Fortunately they were not easily discouraged.

Some of my men were anxious to get a day off because of a circus that had been effectively advertised (I wonder if the demand for coal will ever again become so pressing that superintendents will resent a request from the men for an idle day), and because a lamp salesman saw the possibilities in such a situation, the men got the holiday and the lamp company worked into favor with its lamp.

Miners' oil had always been a rather variable product, and whenever the miners made a kick about the quality of a particular barrel, it was pretty difficult to discredit them. The lamp salesman realized this, and learning through inquiry that our commissary had just received a fresh shipment of oil the previous day, decided to stake his chances on a little plot.

The next day, the day of the circus, he got all of the drivers and some of the miners to come to the top about 10 o'clock declaring that the oil they had received from the commissary that morning made so much smoke that they could not remain longer in the mine. Then they all went home, and I sent a long telegram to the oil company telling them of our troubles and demanding an explanation.

They wired back that they would have another barrel at our commissary by morning and requested us to return the shipment that had given the trouble. This looked like an acknowledgment of crooked work on their part, and I decided to give the lamp salesman all possible encouragement, hoping to cut out the use of miners' oil altogether.

About a week later we received a report from the oil company informing us that they had traced our trouble to a shipping clerk who had shipped us a wrong grade of oil by mistake. They assured us that it would not happen again and begged for a continuance of our business.

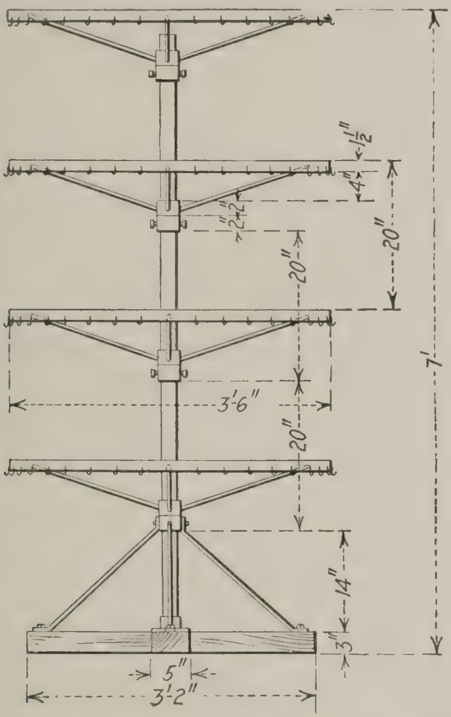
A Safety-Lamp Rack

By M. D. Cooper*

A simple and easily made safety-lamp rack is shown in the accompanying sketch. It consists essentially of a piece of 2-in. pipe about 6 ft. 8 in. long; four pieces of strap iron ¼ in. thick, 1½ in. wide and 11 ft. 1 in. long; 24 rods for spokes, each of ½ in. diameter and 20¼ in. long, and four rods of ⅝-in. material and 24 in. long for braces.



A Simple and Practical Lamp Rack

The foundation of the rack is made up of two blocks of wood, each 38 in. long, 5 in. wide and 3 in. thick. Across the middle of each block a slot 5 in. wide and 1½ in. deep is cut, so that the two may be crossed and made to fit flush on top and bottom. A screwed flange to receive the pipe is attached to the center of the intersecting blocks. The pipe having been screwed into place, a loose sleeve of ½-in. material, drilled and threaded for four setscrews, is slipped over the pipe and made fast at a distance of 14 in. from the bottom, the braces being secured at the same time by the setscrews.

The straps are drilled at intervals of 3$\frac{1}{16}$ in. with holes of sufficient size to pass a 20-penny nail. Then the straps are bent into circular form and riveted, forming a circle 42 in. in diameter. The spokes, six in number, are riveted to the circular piece, the other ends being sunk into the hub. The hub fits loosely over the pipe and revolves around it, being supported on the clamp fastened by setscrews below it. Through the holes in the ring, 20-penny nails are placed and then bent over to form hooks.

The capacity of the rack is 36 lamps on each ring, or a total of 144 lamps. There is space enough beside each hook to stencil the number of the user of the lamp.

Russian Coal Supply

A recent decree authorizes the Russian Minister of Ways of Communication to take into his hands the supplying of fuel to the army and navy, the ways of communication and the manufacturing concerns producing supplies for the army, says Consul General John H. Snodgrass, of Moscow, in *Commerce Reports*. The minister is to unite and coördinate the activity of all concerns which up to now were engaged in supplying the country with fuel. Besides, the minister is authorized to request information from all persons and institutions concerning their supplies of fuel and to control all the supplies of fuel in possession of private persons and firms.

The reason for this decree is the fuel shortage that has made itself felt in Russia. During the last few months the output of coal at the Donetz mines has shown a considerable reduction. The beginning of the war caused a marked reduction, but the production soon assumed a more or less normal course, and the output of last November had almost reached the usual level. However, from the end of the year the output began to decrease and from 2,880,000 short tons produced in November fell to 2,574,000 short tons in December and to 2,432,500 short tons in January, 1915. At the same time the demand for coal had increased. The usual consumers had been joined by a number of concerns in the Baltic and some of the Polish provinces which had formerly used coal from the Dombrovsk district. In ordinary times the consumption of foreign coal in Russia reaches 540,000 to 720,000 short tons; that is, about one-quarter of the entire production of the Donetz district. A number of concerns that are now exceedingly busy furnishing supplies for the army used to work with foreign fuel. It is natural that the requirements of such concerns had to be satisfied first, and this reduced the amount available for the usual customers of the Donetz coal.

The chief reason why the existing supplies of coal are not available is the disorganization of railway traffic. The coal supplies at the mines reached 1,440,000 short tons on Feb. 1, but a considerable part of this quantity cannot be transported in consequence of the insufficient and irregular supply of freight cars.

Measures will perhaps be taken to attract more working hands to the mines. It has also been suggested that some of the railways and manufacturing concerns should replace coal by other fuel, principally oil.

To promote production at the coal mines, the Council of Ministers has approved the following measures: Free transportation of workmen contracted for the mines, admission of women and minors as workers in the mines and liberation of miners from military service.

Does Your Economizer Economize?

By James T. Beard, Jr.*

SYNOPSIS—The ratio of the number of square feet of heating surface in an economizer to the boiler horsepower determines the degree of economy obtained. For any boiler installation this point of maximum saving can be calculated.

The question of efficiency and economy is attracting the attention of managers in all lines of work, commercial as well as industrial. In power plants, especially, this question is of great importance; for the plant which can operate at the least cost can certainly sell power the cheapest, other conditions remaining equal.

The economizer is one of the means of reducing the cost of power-plant operation. Let it be understood, however, that the economizer does not always reduce expenses. Whether it will do so or not depends in a large measure upon the curve load factor, the cost of coal at the plant in question, the efficiency of the boilers and other considerations. In this article the author intends to show how to calculate the loss or saving involved in the installation of an economizer in a hypothetical plant.

Consider, first, the effects which such an installation will have on the conditions already existing. The economizer is placed in the path of the flue gases as they pass from the boiler to the stack. There will be greater resistance, therefore, to the flow of these gases than before. This means that, in order to obtain the same rate of combustion, it will be necessary to increase the draft. This can be done, either by building a higher stack or by installing mechanical apparatus which will supply the additional draft required.

Furthermore the temperature of the flue gases is decreased, owing to the fact that they give up some of their heat to the feed water as they pass through the economizer. This decrease in temperature has the effect of decreasing the draft available with a given stack. Hence, this fact affords an additional reason why the height of the stack must be increased or a mechanical draft system installed to furnish the extra draft necessary.

On the other hand, the feed water is heated in the economizer to a higher degree than is possible in a feed-water heater. Less heat is necessary under the boiler, therefore, to give the required evaporation. This means, of course, a saving in the fuel consumption. Besides this coal conservation, however, there is also a saving in the installed capacity of the boilers. Since one boiler horsepower is equivalent to the evaporation of 34.5 lb. of water per hour from and at 212° F., or 33,478 B.t.u. per hr., if less heat is required per hour, less boiler horsepower is necessary.

A 1000-Hp. Plant Is Assumed

Keeping the above facts in mind, let us assume that we are going to construct a power plant and wish to ascertain whether it will save us any actual dollars and cents to include an economizer in the installation. For the sake of discussion we will suppose that this plant will comprise 1000 boiler hp. and has a curve load factor of 0.8 on a basis of 365 days a year, 10 hours a day. Dry saturated steam is to be generated at 150 lb. gage pressure by boilers whose efficiency is 65 per cent. The calorific value of the coal to be used is known to be 14,500 B.t.u. per lb., and, in order to simplify calculations, we will assume that there is no ash. It should be noted, however, that in an actual determination of this sort allowance must be made for this refuse.

A feed-water heater is to be used at the plant, even if it is found inadvisable to install an economizer. The temperature of the feed entering the economizer, therefore, will be in the neighborhood of 208° F. The flue-gas temperature without the economizer will be assumed as 550° F.

Let us first see what the theoretical coal and steam consumptions in such a plant will be. A boiler horsepower has been defined above as the evaporation of 34.5 lb. of water per hour from and at 212° F. Now since it requires 970.4 B.t.u. to evaporate 1 lb. of water at this temperature 1 boiler hp. represents 970.4 × 34.5, or 33,478 B.t.u. per hr. Since the boiler efficiency is 65 per cent., the amount of heat necessary under the boiler to give 1 boiler hp. is equal to $\frac{33{,}478}{0.65}$, or 51,505 B.t.u. per hour. Hence, the coal consumption will be $\frac{33{,}478}{0.65 \times 14{,}500}$ or 3.55 lb. per boiler hp.-hr.

The total heat content of the steam generated above 32° F. is found from the steam tables to be 1195 B.t.u. per lb. The heat content above 208 F. will be, therefore, 1019 B.t.u. per lb. This value represents the amount of heat required to evaporate 1 lb. of water in the boiler at 150 lb. gage pressure. The water rate will then be $\frac{33{,}478}{1019}$, or 32.8 lb. steam per boiler hp.-hr.

Area of Heating Surface Is an Important Factor

It is evident that the area of the heating surface of the economizer exposed to contact with the flue gases is one of the factors which will govern the amount of heat that will be transferred from these gases to the feed water in a given time. Thus, the temperature rise of the feed will depend in part on the area of this heating surface. In selecting an economizer it is customary to so proportion the square feet of heating surface to the boiler horsepower that the ratio between these two quantities will lie somewhere between 1 : 3 and 1 : 5. For our case we will assume that this ratio is 1 : 4.

We are now in a position to calculate the rise in temperature that such an economizer will produce in the feed. In this calculation we will employ the formula in use by the Green Economizer Co., as follows:

$$T = \frac{y\,(T_1 - t_1)}{\frac{w}{U} + \frac{5\,w + GC}{2\,GC} \cdot y}$$

Where

T = Temperature rise in feed (deg. F.);

T_1 = Temperature of flue gas entering economizer (deg. F.);

t_1 = Temperature of feed water entering economizer (deg. F.);

---

*Combustion Engineering Corp., 11 Broadway, New York.

w = Pounds feed water, per boiler hp.-hr.;

G = Pounds flue gas, per lb. of combustible (assumed as 20);

U = Rate of heat transfer per sq.ft. of economizer surface per hour per degree of difference between the temperatures of gases and water (asumed as 3.3 B.t.u.);

C = Pounds coal per boiler hp.-hr.;

y = Area in square feet of heating surface, per boiler hp.

Substituting values in the above equation we have

$$T = \frac{4\,(550 - 208)}{\dfrac{32.8}{3.3} + \dfrac{5 \times 32.8 + 20 \times 3.55}{2 \times 20 \times 3.55} \times 4} = 82.5°\ F.$$

That is, the feed-water temperature is increased 82.5° F. above 208° F., and enters the boiler at 290.5° F. instead of at 208° F., as before. On the entire plant we are thus saving 32.8 × 1000 × 0.8 × 82.5, or approximately 2,165,000 B.t.u. per hr. Expressed in boiler horsepower this saving represents $\frac{2{,}165{,}000}{33{,}478}$, or 64.6 boiler hp. In other words, we are saving 64.6 boiler hp. on the installed capacity of the plant; and, if we figure this at $20 per hp., we save 20 × 64.6, or $1290 on the first cost of the plant.

We must not forget, on the other hand, that we have also added to the first cost by buying this economizer. We can roughly estimate this additional cost as follows:

Total sq.ft. heating surface = 4 × 1000 =	4000
4000 sq.ft. @ $1 per sq.ft.	$4000
Cost to install @ $0.20 per sq.ft.	800
Total	$4800
Less saving in boiler hp.	1290
Net increased first cost	$3510

A yearly charge of 20 per cent. of this cost must now be made to take care of interest on the investment, depreciation, repairs, taxes, insurance, operation and general office expense.

It is evident, then, that, thus far, the economizer involves a yearly expense of 3510 × 0.20, or $702.

THE REDUCTION IN THE COAL BILL

In one of the preceding paragraphs it was stated that the extra heating of the feed water resulted in a saving of approximately 2,165,000 B.t.u. per hr. It follows, then, that the coal bill will be considerably cut. The extent of this reduction is readily calculated.

$$\textit{Lb. coal saved per hr.} = \frac{32.8 \times 1000 \times 0.8 \times 82.5}{14{,}500 \times 0.65}$$

$$= 230\ \textit{lb. per hr.}$$

$$\textit{Tons coal saved per yr.} = \frac{230 \times 3650}{2000}$$

$$= 420\ \textit{tons per yr.}$$

If we assume that in the locality where our plant is situated coal sells at $3 a ton, then the yearly saving represented by this reduction in fuel consumption is 420 × 3, or $1260.

There remains now for our consideration only the loss due to the fact that some device must be provided to supply extra draft for the plant. If the saving on our fuel bill is greater than this loss plus the yearly charge on the economizer, then our installation has been a success.

It was previously stated that the loss in draft could be made up either by increasing the height of the stack or by installing a mechanical draft system. In view of the difficulties and high extra cost involved in increasing the height of the present stack, however, it is cheaper and, therefore, advisable to install a mechanical draft system. Let us say that in this plant we will use an induced-draft fan. This does not mean that we are not going to have any stack at all. As a matter of fact, we have assumed that we will have a stack of sufficient height to take care of the draft required when the economizer is cut out. When the economizer is in operation it will be necessary to have this induced-draft fan to help the stack supply the proper draft.

$$\textit{Draft (in. water)} = H\left[\frac{7.64}{T_1} - \frac{7.95}{T_2}\right]$$

where

H = Height stack (ft.);

T_1 = Outside temperature (deg. F. abs.);

T_2 = Stack temperature (deg. F. abs.).

In order to calculate the height of stack necessary to supply the proper draft when the economizer is not operating, certain assumptions must be made in regard to the various draft losses. Thus,

Loss in furnace, in. water	0.10
Loss in boiler, in. water	0.30
Loss in flue and turns, in. water	0.15
Total, in. water	0.55

Besides these there is a stack loss which is generally considered as 20 per cent. of the whole. The whole loss, will, therefore, be $\frac{0.55}{0.80}$, or 0.688 in. water. Assume that the outside temperature averages about 70° F. In one of the early paragraphs we said that we would consider the stack temperature as 550° F. at the base. These assumptions enable us now to calculate the height of our stack.

$$0.688 = H\left[\frac{7.64}{460 + 70} - \frac{7.95}{460 + 550}\right]$$

Therefore,

$$H = 105\ \textit{ft.}$$

THE FLUE-GAS TEMPERATURE IS DECREASED

It is now time to investigate the drop in temperature of the flue gases due to the fact that they give up some of their heat to the feed water in the economizer. It is evident that the heat absorbed by the water per boiler hp.-hr. will be equal to that given up by the flue gases per boiler hp.-hr., assuming that there is no loss by radiation, etc.

The heat absorbed by the water per boiler hp.-hr. = 32.8 × 82.5 = 2710 B.t.u.

The heat given up by the gases per b.hp.-hr. = 20 × 3.55 × 0.25 × T.

Notice that we represent the fall in temperature of the flue gases by the symbol T. The specific heat of these gases is assumed as 0.25.

$$T = \frac{2710}{20 \times 3.55 \times 0.25} = 153°\ F.$$

Hence, the temperature of the gases at the base of the stack when the economizer is in operation will be 550 — 153, or 397 deg. F. Allowing 10 deg. F. for loss by radiation, the stack temperature will average 387 deg. F. The draft given by the 105-ft. stack will, then, be considerably less, as is shown below.

$$\textit{New draft} = 105\left[\frac{7.64}{460 + 70} - \frac{7.95}{460 + 387}\right]$$

$$= 0.526 \textit{ in. water}$$

Allowing for the added resistance of the economizer surface to the flow of the gases, the draft which ought to be supplied by the stack in order to obtain the proper rate of combustion is 0.688 + 0.150, or 0.838 in. water. As a matter of fact, it is not possible to supply more than 0.526 in. water with this stack when the economizer is running. For this reason, the difference between 0.838 and 0.526, or 0.312 in. water, must be made up by the induced-draft fan. This corresponds to a pressure of 1.62 lb. per sq.ft. Assume that the fan runs at 75 per cent. opening and that the mechanical efficiency under these conditions is 40 per cent. The horsepower of such a fan will be computed as follows:

$$Hp. = \frac{\textit{cu.ft. per min.} \times \textit{pressure in lb. per sq.ft.}}{33{,}000 \times \textit{efficiency}}$$

The maximum weight of gas flowing per hour will be 3.55 × 1000 × 20 = 71,000 lb. per hr. This weight corresponds roughly to 27,335 cu.ft. per min. Therefore, the maximum or installed horsepower of the fan will be,

$$Hp. = \frac{27{,}335 \times 1.62}{33{,}000 \times 0.40} = 3.35 \textit{ hp. about}$$

This type and size of fan, together with its engine and air ducts, will cost, installed, about $335. A yearly charge must be made against this value to cover the interest on the investment, depreciation, maintenance, taxes, insurance, etc., amounting to about 15 per cent. The yearly overhead charge on the fan and equipment will then be 335 × 0.15, or $50.20.

The Cost of Operating the Draft Fan

It remains now for us to compute, or rather estimate, the cost of operating this added unit of equipment. This we shall proceed to do on the basis of the average horsepower of the fan for the year and not on the basis of the installed or rated capacity. The average weight of flue gases flowing per hour is found to be 3.55 × 1000 × 0.8 × 20, or 56,900. Expressed in cubic feet per min., this becomes 21,800. This, then, is the average volume of gas that the fan has to handle. The average horsepower is found to be, therefore,

$$Hp. = \frac{21{,}800 \times 1.62}{33{,}000 \times 0.40} = 2.675$$

If we allow a steam consumption of, say, 70 lb. per i.hp.-hr., the weight of steam necessary to operate this fan will be 70 × 2.675, or 187.3 lb. per hr. The weight of coal burned under the boiler per pound of steam generated is $\frac{3.55}{32.8} = 0.108$. The coal required per hr. to operate the fan will, therefore, be 187.3 × 0.108 = 20.2 lb. Expressed in tons per year this becomes $\frac{20.2 \times 3650}{2000} =$ 36.9 tons per year. The operating cost of the fan equipment may then be estimated in this manner:

36.9 tons @ $3	$110.70
Lubrication, etc.	2.21
Total	$112.91

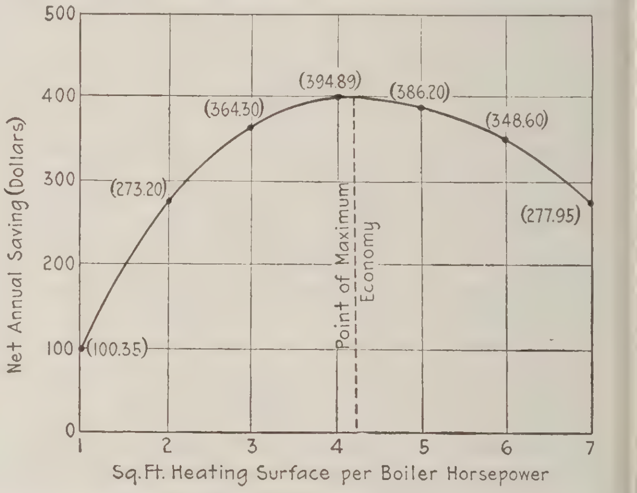
The various items of saving and expense may now be summed up as follows:

Item	Saving	Expense
Overhead Charges		
On first cost of economizer less saving in b.hp.	......	$702.00
On first cost of fan and equipment	......	50.20
Operating Charges		
Fan	......	112.91
Saving on main units (fuel)	$1260.00	
	$1260.00	$865.11
	865.11	
Net annual saving	$394.89	

We may conclude, therefore, that, granting the assumptions that have been made, if we so select our economizer that the ratio of the square feet of heating surface to the boiler horsepower will be 1 : 4, the net annual saving will be approximately $400 as we have calculated. On the other hand, if we select our economizer of such a size that we get a different ratio, it is only reasonable to suspect that we shall obtain a different result as our annual net saving.

The Point of Maximum Economy

Furthermore, we are led to believe that there might, not necessarily must, be some definite ratio betwen these two factors which would give a maximum annual net saving for the plant. This ratio would, of course, vary with different plants; but, for a given installation it would be fixed and constant.



CURVE SHOWING RELATION BETWEEN RATIO OF ECONOMIZER AND BOILER HEATING SURFACES AND NET ANNUAL SAVING

This amounts to saying that, for a given plant, there is one and only one size of economizer which will give a maximum annual net saving. To prove this theory it is merely necessary to calculate the net saving for different selected values of this ratio and compare them. The results of such a calculation are shown in the following table:

Sq.Ft. per Boiler.Hp.	Temp. Rise	Fuel Saving	Expense Economizer (Overhead)	Expense Fan Overhead	Expense Fan Operation	Net Annual Saving
7	111.0	$1760	$1212	$65.25	$144.80	$277.95
6	103.3	1580	1036	60.70	134.70	348.60
5	93.7	1435	868	56.20	124.60	386.20
4	82.5	1260	702	50.20	112.91	394.89
3	68.7	1050	545	43.70	97.00	364.30
2	51.6	790	398	36.90	81.90	273.20
1	29.4	450	268	28.50	63.15	100.35

The results as tabulated above, show without a doubt that this theory is correct. If we take these results and plot the net annual savings as ordinates and the square feet of heating surface per boiler horsepower as abscissas a smooth curve is obtained as shown in Fig. 1. By inspection of this curve, it is evident that there is a maximum point at about 4.25 sq.ft. per boiler hp. This means that, if we select our economizer of such a size that there are 4.25 sq.ft. of heating surface for each boiler horsepower, we will obtain the highest possible annual net saving at this particular plant. In other words, in the case assumed our economizer should have 4250 sq.ft. of heating surface. Under these circumstances the maximum economy is obtained and, according to the curve, an annual net saving of $405 should be realized.

⁂

Powdered-Coal Fire at Burden Iron Works, Troy

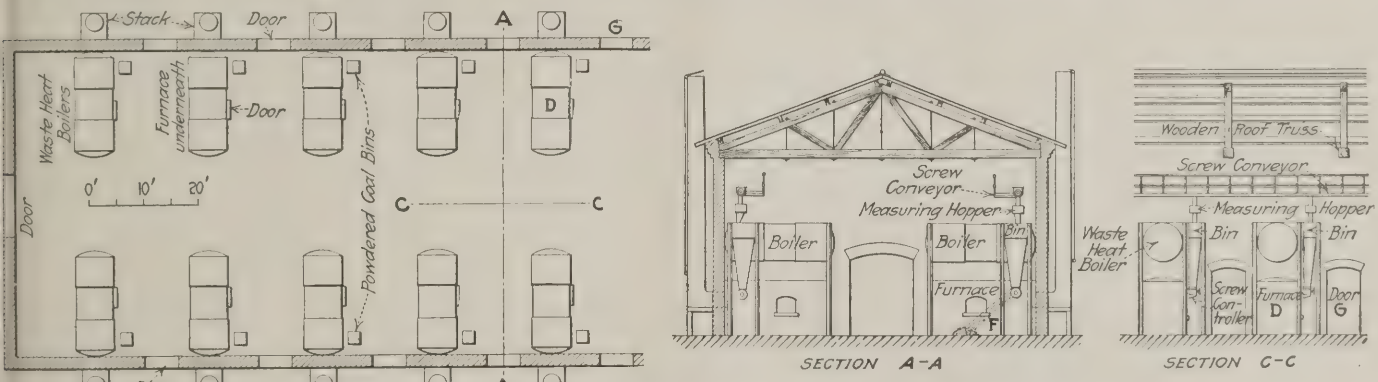
On Mar. 18, at 10 p.m., a fire occurred in the puddling-furnace building of the Burden Iron Co., at South Troy, N. Y. This the newspapers erroneously called an explosion due to powdered coal.

There were about 80 puddling furnaces, and about one-fourth were using powdered coal as fuel. There was the usual milling plant, containing pulverizers, crushers, driers and the necessary bins and elevators. The pulverized coal was carried from the milling plant to the several furnaces by screw conveyors. At each puddling furnace there was a 1-ton steel bin with the requisite motor and controller to inject the fuel into the furnace.

The plant was running night and day, and the powdered-coal plant (furnished and erected by the Quigley Furnace & Foundry Co., of Springfield, Mass.) had been in operation since last fall. There had been the usual troubles with new machinery, but these had all been successfully overcome except one. The powdered coal persisted in caking in the bins, so that at times there was none flowing into the controller. This compelled constant hammering on the bins. Some became so battered that this hammering was forbidden by the management a week or so previously.

On the night of the fire the operator at one furnace (*D* in the sketch) had removed the small slide from the foot of the hoppered steel bin, thinking, no doubt, that the coal would move more freely into the controller. But the coal dust was leaking out in small quantities upon the floor. There was a strong breeze blowing at the time, and as all the doors on the side walls were open, puffs of wind blew little clouds of this leaking coal dust in front of the furnace door (as at *F*). As the operator was pulling out a heat, with slag falling at his feet, the coal dust became ignited. Instantly, there was a flash and the flame darted upward into the roof trusses. These were wooden trusses with comparatively large surfaces, covered with fine coal dust which had settled there. The whole roof quickly became ablaze, and the men had to drop their tools and run for their lives.

The fire burned from 10 p.m. until 2 a.m., when the roof fell in on the furnaces. A part of the building had steel trusses and did not burn. The measuring hopper, screw conveyors and walkways came down with the roof, but there was no back-flash of coal dust through the conveyors, nor was there any explosion of coal dust. The destruction is to be charged to employees rather than to equipment.—*From Engineering News.*



Arrangement of Powdered-Coal Furnaces at Burden Iron Works

⁂

West Virginia-Pittsburg Coal Co. Officials Confer

The "occasional conference" of the West Virginia-Pittsburg Coal Co. was held at the Hudson House, Wellsburg, W. Va., on Tuesday evening, Apr. 27, and was attended by all official employees of the Wellsburg and Collier mines of the company and also a number of the prominent citizens and coal men of the vicinity.

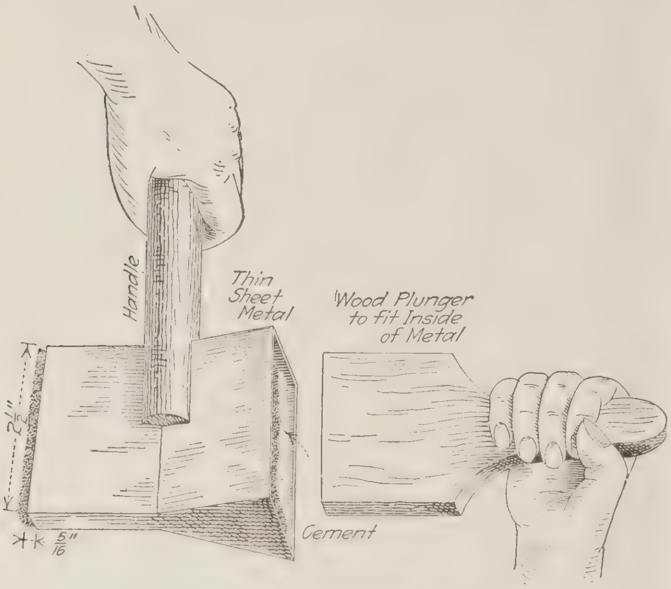
Among those present were several who were not employees of the company. Inspector Riggleman, of the First West Virginia Inspection District, spoke at length on the Safety First movement in West Virginia. He was followed by the Hon. Elmer Hough, who gave a brief history of Brooke County coal. Alexander Gilcrist told of his experience as a pioneer coal operator in Brooke County before the days of the Pan Handle R.R. Sheriff Patterson and Attorney Carter made interesting speeches. R. Z. Virgin, superintendent of No. 1 mine, spoke on "Mine Cars and Their Methods of Construction." S. M. McMahon spoke on "My Experience with the Shortwall Mining Machine." W. D. McCausland, general superintendent of the West Virginia-Pittsburg Coal Co., gave a brief outline of the extent of the company's coal-land holdings. Dr. Focer, company physician, spoke on "Sanitation in Mining Villages." L. H. McAmic, editor of the Wellsburg Herald, spoke on "How to Handle Coal Mine News." Captain Oakes of the steamer "J. O. Watson" spoke briefly on "River Traffic." Hefron Robison, general manager, acted as master of ceremonies.

At the close of the conference Samuel M. McMahon, superintendent No. 4 mine, making the presentation speech for the operating officials of the company (the speech being ably set forth in a poem written by Mr. McMahon, "The Humorous and Genial Scotchman"), presented a token of the esteem and appreciation in which Mr. Robison is held by his officials.

Boiler-Room Repairs

Most engineers and firemen are not very skillful in laying brick, says George C. Abbe in *Power,* but there are times when a few minutes spent in pointing up loose brick with cement or fireclay when the fires are out will develop a good job well done.

Getting fireclay or cement in between brick is not always as easy as it might seem. The illustration shows a sort of a square squirt gun with which you can fill up the most obstinate crack or hole, and you don't have to be a mason to do it either.



"Gun" for Pointing Up Side

Always keep on hand a little cement, and whenever a crack shows up and needs attention it takes only a few minutes to fix it, and the job is better than that usually done with the time-honored trowel. Our original model was made from a small tin can and a piece of a barrel stave, which was used until worn out, when we had something suitable made by a tinsmith.

⁂

Coal Situation in Spain and Italy

Spain is rich in coal lands, says Consul Robertson Honey, of Madrid, in *Commerce Reports.* The area of carboniferous tracts approximates 4900 sq.mi., which is nearly double that of France and only one-third less than that of England. Of this area, however, only about one-fifth is worked—from which it is evident that the development of the coal industry in this country has not reached a high mark.

The causes for this lack of development are to be found in insufficient capital, high wages, high freight rates and the fact that many industries use electric current generated by water power. It has been estimated that the electric power employed in this manner would require 400,000 tons of coal annually for its generation, or between 5 and 6 per cent. of Spain's total consumption. The cost of hydro-electric power is about one-half that of the same amount of energy developed by use of coal.

English coal competes readily with the domestic and undersells it at seaports; only in the northern provinces of Spain, such as Asturias, where water transportation is available, can domestic coal meet the competition of English fuel. Thus it is that 60 per cent. of the domestic coal used in Spain is supplied by that province; on account of freight rates other provinces of Spain, quite as rich in coal as Asturias, consume their own output, but do not ship. In this situation are found the mines of Puertollano, Penarroya, Leon, Seville and Palencia. In 1913 (the latest year for which details are available), Asturias produced about 2,750,000 short tons of coal; Ciudad Real, 410,000; Andalusia, 387,000; Leon, 360,000; and the total for all Spain was approximately 4,161,500 tons, valued at $13,750,000.

During the past eight months imports of English coal have fallen off and the output of Spanish coal has increased 20 per cent., but the demand for foreign coal continues. Before the outbreak of the European war Spanish coal sold at wholesale for about $7 per short ton at the coal yard; the price now is $14.25. Similarly, freight rates by water from Gijon to Barcelona, for instance, have been raised from $1.60 to $4.50 per short ton. A leading wholesaler in Madrid states that eight months ago he sold English coal at 70 to 72 pesetas per metric ton of 2204.6 lb.; to-day he receives 100 pesetas (the silver peseta equals $0.205 at exchange of this date).

From the facts set out above, American coal exporters can make a rough estimate as to the availability of Spain as a market and can determine whether the question is worth taking up in detail. As of interest in this connection, the figures of Spain's imports of coal and coke in 1913 are given below:

	Coal		Coke	
Imported from	Tons	Value	Tons	Value
United States	37,250	$176,000	1,916	$12,200
Belgium	1,130	53,500	7,300	46,500
France	21,500	101,400	12,150	98,300
Germany	183,700	868,500	34,650	220,400
Netherlands	45,800	216,700	.....	.....
United Kingdom	2,682,000	12,680,000	360,000	2,230,000

(Prior to Apr. 7, 1915, foreign coal was subject to both an import duty and a transportation tax, but by a decree of that date these levies were suspended.)

⁂

Coal Mining on the Bonus System

In view of the animated discussions that have taken place in coal-mining circles in Britain with regard to the successful institution of a profit-sharing or bonus system in the coal-mining industry, it is interesting to get particulars of a system in vogue in Sardinia and which has been tested for some years. The mining business employs some thousands of men and has been based on the principle that those workmen who have been employed for a certain time are entitled to a share in the profits of the business and that capital has a right to its wages in the same way as labor has a right to its wages.

The workman receives a bonus in the wages earned by him during the year equivalent to the percentage paid to the shareholders above the rate fixed as the wages of capital, which may vary according to the nature of business. Thus assuming 5 per cent. as the wages of capital and 10 per cent. dividends to the shareholders, the bonus to which the workman would be entitled is 5 per cent. on the wages earned.

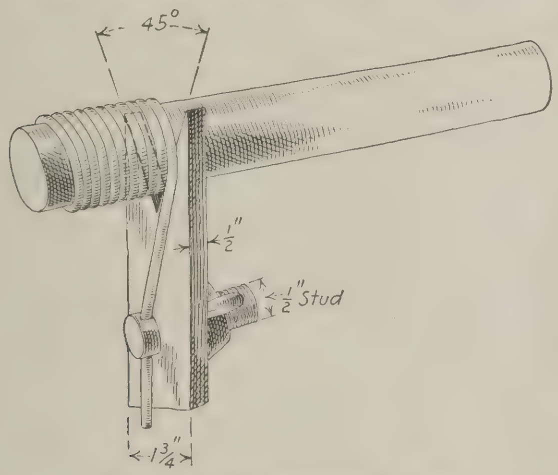
This bonus is not distributed, but is accumulated for him at 5-per cent. interest and cannot be withdrawn until after he leaves the company's service. A modification has recently been introduced in the regulations governing the bonus scheme that constitutes a further step in the direction of labor copartnership.

When the capital standing to the credit of a workman reaches a certain sum it will receive interest at the same rate as the bonus in wages, with a minimum of 5 per cent. interest. This interest is paid out every year, instead of being passed as hitherto to the workman's credit. The effect of this provision is to make the workman a sort of preference shareholder.

The third and final step toward labor copartnership by which the workman as a shareholder acquires a voice in the management may come later on. Real progress toward the desired end can only be attained by gradual steps. The introduction of such a system in British and American mining companies could be done without negotiating with trade unions or consulting the men, and in it might be found a more real solution for the labor troubles which now seem to be so prevalent.

Spring-Winding Fixture

The illustration shows a spring-winding fixture, says F. L. Young in *Power.* Regardless of the diameter of the rod the spring is to be wound on, the tension is adjustable and the stress is taken up by the fixture itself.



Position of Fixture in Use

It is made from a piece of machine steel ½x1¾x14 in. long with a 45-deg. notch in the end, and drilled to receive a ½-in. stud and a standard ½-in. wing-nut. Drill a hole, say ¼ in., in the stud close up to the head, and the fixture is complete. To wind an open spring the tool is held in the tool post, getting the lead required by the lead screw, the same as for any other purpose. Closed springs are wound with the fixture held in the hand, and the wire will give its own lead.

Coal Trade at Palermo

The amount of coal received at Palermo annually, says Consul Samuel H. Shank, in *Commerce Reports,* is something over 200,000 tons. The greater part of it has come from England, being Cardiff and Newcastle coal. Small amounts were received from the United States in the past, but since the war commenced several cargoes of Pocahontas, New River and Fairmont coals have been imported. Some anthracite has been brought from Scotland, but thus far none from the United States. The demand for anthracite is steadily growing. There are no coal mines in the island of Sicily. The prices before the war compared with the present quotations, c.i.f. Palermo, are: Cardiff, usual price $6.08, present price $13.13; Newcastle, usual price $4.86, present price $11.55; anthracite, usual price $7.80, present price $14.60.

Coal received by dealers is stored in warehouses having a capacity of about 25,000 tons and located close to the docks. The state has a supply for the use of railways and mail boats, but this is piled in open yards at the docks and railway station. The government usually has about 15,000 tons on hand, and private stocks at present are probably somewhat smaller. It is estimated that there are 25,000 to 30,000 tons now on hand in Palermo. Coal is delivered to the ships in lighters of 8 tons' capacity, being passed in baskets by hand into the ship. No machinery is used. Usually four lighters and 40 to 50 men are employed. In 12 hours 300 tons can be loaded at a cost of 68c. a ton, laborers receiving 97c. a day.

Recent Legal Decisions

Liability for Freight Charges—A coal dock company does not become liable for freight charges on a shipment of coal merely through its receipt of the coal for storage and forwarding for the owner. (United States Circuit Court of Appeals, Eighth Circuit; Seither Transit Co. vs. Great Lakes Coal & Dock Co., 220 Federal Reporter 28.)

Employment of Minors; Liability Concerning Simple Appliances—When a coal operator employs a boy who is above the statutory age limit he is entitled to assume that the boy possesses the intelligence usually possessed by boys of the same age, so far as concerns the duty of instruction against dangers incident to his work. An employer is not liable for injury resulting from a defect in a simple appliance which could have been easily and speedily repaired by the injured employee. (West Virginia Supreme Court of Appeals, Martin vs. Carter Coal Co., 84 Southeastern Reporter 574.)

West Virginia Safety Requirements—Even if the West Virginia statute which requires elevators to be safeguarded to avoid injury to employees can be said to be applicable to mine cages, it cannot be construed as making a coal operator liable for injury to an employee working near the bottom of a shaft caused by fall of an object down the shaft while it was being loaded on a cage, due to space left between the platform and the edge of the shaft. The statute was designed only for the protection of employees while in or near elevators. (West Virginia Supreme Court of Appeals, Ferguson vs. Middle States Coal & Coke Co., 84 Southeastern Reporter 573.)

The Optimist

By WALT MASON

(Written expressly for "Coal Age")

The optimist is one who knows that life has many kinds of woes; he doesn't say, for our relief, that there is no such thing as grief. He doesn't whoop around and swear that there is no such thing as care.

The "sunshine" fakers talk that way, and bore the world from day to day.

The optimist who saws the wood knows life has much that isn't good; he doesn't fool himself with bunk, nor try to gold-plate pewter junk; he doesn't say that black is white, or see a dozen moons at night. He sees conditions as they are, yet ties his wagon to a star.

Progressiveness his watchword is; it animates his life and biz. If times are dull and business slack, he doesn't weep and wail, "Alack!" His mind is stored with useful facts which help and guide him in his acts, and so he knows just what to do, to keep his trade from falling through. A hundred useful hints he's read, and he has kept them in his head, and he can draw on that supply when business seems to wish to die.

For knowledge is the stuff that wins; it beats all optimistic grins. Most any gent can smile and smile, when things jog on in splendid style; most any gent can sing and dance when he has roubles in his pants; but when all things are going wrong, the unread critter cans his song, and pulls his hair and wags his ears, and says this is a vale of tears.

When things are going doubly wrong, the optimist then looms up strong—the optimist who stores his mind with all the knowledge he can find.

The Labor Situation

SYNOPSIS—The ending of the strike in eastern Ohio does not insure the immediate reopening of all the mines, as the coal has partly lost its market during the long strike. The Federation of Labor in Colorado protests against the conviction of Lawson. The Industrial Relations Commission publishes the Rockefeller-Lee correspondence.

The ratification of the new wage scale by the joint committee of operators and miners representing the eastern Ohio district and the signing on May 13 of the document by Charles J. Albasin, C. E. Maurer and S. H. Robbins, the former for the Union and the latter for the Pittsburgh Vein Operators Association, formally ends the 13½ months' strike in that coal region.

But in the meantime eastern Ohio operators have lost a portion of their market, and it is doubtful if they will ever be able to regain it. Despite the slack demand for coal some of the mines are being put in condition for operation. Others will not be opened until the operators see their way clear to sell their product. So the feeling in eastern Ohio is not one of elation, but rather of expectancy. The companies hope that something will be done this summer which will enable them to regain their lost position in the markets of the country.

Mines Will Be Inspected before Being Reopened

J. M. Roan, chief deputy of the Industrial Commission of Ohio and safety commissioner of mines, with his deputies started out in his mine-rescue car as soon as the agreement was ratified. They will inspect all the mines in eastern Ohio, and none will be allowed to start operation without the examination of the agents of the commission.

Last week it was said that the Moore's Run mine of the Hutchinson Coal Co. and several operations of the Youghiogheny and Ohio Coal Co., the Rail and River Coal Co. and the Pursglove-Maher Coal Co. were ready for reopening. Only a small percentage of the striking miners will be furnished work at this time.

The miners' representatives headed by Senator Green have appealed to the governor to veto the Gallagher amendment, but so far he has taken no action on the bill. The miners' officials threaten to defeat the amendment by a referendum vote in case the governor fails to veto it.

State Senator William Green, secretary-treasurer of the United Mine Workers of America, declared at Wheeling, W. Va., that the Industrial Workers of the World had been largely responsible for the delayed settlement of the eastern Ohio strike and condemned those who tried to belong both to the union and the I. W. W.

Colorado Federationists Bring Charges against Judge

The executive board of the Colorado State Federation of Labor has brought charges against Judge Granby Hillyer, who has just tried John R. Lawson, the international board member of the United Mine Workers of America in Colorado and Louis Zancannelli, a union miner. Both have been found guilty of murder.

The board alleges that excessive bail has been required and that trial has been denied except in a few instances. It states that the first jury was so in doubt as to the guilt of J. R. Lawson that 8 out of 12 voted for acquittal. Then the open venire system was followed and "notorious partisans of the coal companies were brought in as jurors. Coal company doctors and managers, kin-people of coal-company managers and men who had participated in battles with the striking miners were selected and before this jury Lawson and Zancannelli were convicted."

Alleges that a Company Attorney Was Specially Appointed

It is also asserted that the judge is a coal-company attorney and has been employed in cases against the miners. The executive board of the State Federation of Labor also states that a special act was passed by the legislature for the appointment of a judge in the district and that as a result the operators succeeded in getting their own attorney appointed. Affidavits were made setting up facts by which the judge was shown to be disqualified, according to the same board, but without causing him to withdraw.

The following statement is also made: "On the trials he refuses to permit jurors to be asked the question as to whether or not they could give the defendants the benefit of the rule of law which provides that a man accused of crime shall at the outset of the trial be presumed to be innocent. In one of the cases he even permitted a juror to serve who, according to the undisputed affidavits, had a gambling wager on the result of the verdict."

Correspondence between John D. Rockefeller, Jr., and Ivy L. Lee

On May 16 the United States Commission on Industrial Relations made public the correspondence between John D. Rockefeller, Jr., and Ivy L. Lee relative to a publicity campaign undertaken by Mr. Lee at Mr. Rockefeller's request. By this campaign it was hoped to put a more correct idea of the Colorado situation before the public than that which had hitherto been circulated.

In what has been published of these letters there is really nothing worthy of republication. Apparently Mr. Rockefeller sent Mr. Lee many letters and papers for his information in conducting the publicity campaign. In one letter he speaks of "an excellent article from the 'Coal Age' which outlines a plan for a broad educative campaign of publicity, such as you and I have talked of."

Mr. Rockefeller lent $2000 to Mr. Lee to assist him in his publicity work. This money was to be returned by Mr. Lee as soon as he began to receive checks from the Coal Operators' Committee.

Dates of First-Aid Meets

The following meets have been organized largely as a result of the energetic work of the American Mine Safety Association and the Bureau of Mines. Some, as will be noticed, have already been held.

Apr. 15, Fort Worth, Tex.
May 1, Butte, Mont.
May 1, Canton, Ill.
May 12-14, Huntington, W. Va.
May 14-15, Pineville, Ky.
May 18, Fort Smith, Ark.
May 22, McAlester, Okla.
May 25, Pittsburg, Kan.
May 29, Birmingham, Ala.
June 1, Moberly, Mo.
June 5, Des Moines, Iowa.
July 2-3, Big Stone Gap, Va.
July 23-24, Billings, Mont.

The American Mine Safety Association needs and should receive the financial support of all coal companies because of the valuable work it is doing to develop the first-aid and mine-rescue service of the country. It is at least entitled to have as members every coal corporation in the neighborhoods where it holds organized meets, and still more justified is it in anticipating that all the participant companies will assist by applying for membership. The fee is only $10 per year. Admission blanks can be obtained on application either to H. M. Wilson, secretary-treasurer, 40th and Butler St., Pittsburgh, Penn., or to COAL AGE, 36th St. and 10th Ave., New York City.

Coming Meetings

M. O. I. Coal Association annual meeting will be held June 22-25, 1915, at Cedar Point, Ohio. Secretary, B. F. Nigh, Cleveland.

Rocky Mountain Coal Mining Institute will hold its next meeting in Trinidad, Colo., June 8, 9 and 10. Secretary, F. W. Whiteside, Denver, Colo.

West Virginia Mining Institute will hold its summer meeting at Wheeling, W. Va., June 15 and 16. Secretary, E. N. Zern, Morgantown, W. Va.

The Mine Inspectors' Institute of the U. S. A. will hold its annual meeting June 8, 9, 10 and 11, 1915, at St. Louis, Mo. Secretary, J. W. Paul, Pittsburgh, Penn.

The American Society of Mechanical Engineers will hold its summer meeting at Buffalo, N. Y., June 22-25, 1915. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

The American Institute of Electrical Engineers will hold its annual convention June 29 to July 2, 1915, inclusive, at Deer Park, Md. Headquarters will be at the Deer Park Hotel. Secretary, F. L. Hutchinson, New York.

The Pennsylvania Retail Coal Merchants' Association will hold its 11th annual convention at Wilmington, Del., June 15, 16 and 17, 1915, with headquarters at the Hotel DuPont. The first two days of the convention will be devoted to business, including exhibition of coal-handling machinery in action, supplies and motor trucks. The U. S. Bureau of Mines will show by motion pictures every detail of anthracite mining, accompanied by a lecture by Charles Enzian, of Wilkes-Barre, Penn. The "Queen Anne" has been chartered to take the members and their friends on June 17 down Delaware Bay.

Editorials

A Great Opportunity, But--

Since Aug. 1, 1914, there has been a decided demand for American products in the markets of the world. This demand, so far as we are concerned, came without seeking or effort. As has been pointed out time and again in the public press, the present is a season of opportunity for American business unprecedented in the annals of history.

During the past few months American coal has found a ready market in countries which formerly used only European fuels. Italy, Spain, Egypt and the great republics of South America have made purchases of coal from this country where German and English fuel had been previously employed.

For obvious physical or rather geographic reasons it is to Brazil and Argentina that the United States may look with greatest hope for a foreign outlet for our surplus coal production. Both countries are rich naturally. Each produces a superabundance of many commodities which this country might well absorb. Wheat, beef, wool, goatskins, coffee, chocolate, sugar, rubber are but a few of the products of a soil of great fertility and a climate well adapted to their production.

It is useless for one people to attempt to trade with another unless there is a mutual interchange of commodities. Furthermore, in order to secure and maintain beneficial commercial relations each party should so far as possible cater to the needs and wishes of the other. The mine commissary manager who insists on keeping only the best grade of creamery butter when the miners and their families ask only for oleomargarine will soon discover that he has but few customers. In like manner it will be disadvantageous for American producers to ship run of mine and demand cash on presentation of bill of lading when prepared sizes and six months' credit are necessary in order to suit the customer's needs. American exporters and coal producers are "green" at meeting and filling the requirements of foreign consumers, and they might to advantage study well the needs and desires as well as the acknowledged necessities of prospective customers.

Of all phases of the situation, however, probably the most difficult to overcome immediately is the lack of adequate transportation facilities. With our coal mines idle or working on scant time, with many foreign countries anxious to secure American fuel and offering prices which would yield our producers handsome profits, we suffer from a lack of ships to transport our coal to foreign countries and bear back in return their products to our shores.

One hundred years ago or thereabouts, America in large measure monopolized the carrying trade of the world. Clipper-built ships, barks and schooners all flying the flag of the United States were to be found in all quarters of the globe, and the American merchant marine was the mightiest on earth. Today we as a nation are reaping a bitter harvest, the fruit of criminal shortsightedness on the part of our past lawmakers and so-called statesmen. The American merchant marine is, or at least was a few months ago, extinct so far as foreign freight is concerned.

The field of opportunity is ripe for the harvest. America lacks neither skill nor incentive to meet the occasion. Successful entrance into and the retention of any considerable portion of the world's fuel markets, however, would mean big business, and many of our people are obsessed with the idea that big business is "pizen." If this idea can be eradicated and our big coal-producing organizations allowed to enter the field untrammeled by petty legal restrictions and persecutions or the fear thereof, we as well as our customers in other lands may reap a lasting benefit.

*

Doing Less Than Nothing

Some men are so placed industrially that they tend to prevent and retard rather than to help in the performance of useful work. Those of our readers who were born in England will remember the man with a red flag who went ahead of traction engines to warn the vehicular traffic and help to control restive horses.

This yokel served admirably to prevent the development of the auto car and auto truck, for if the speed had to be kept down to suit the man's slow rate of travel, there could never be an economical operation of the motor truck.

But it seemed wiser to the British Parliament to require that the men be hired than that the farmers be asked to break the horses and make them tractable in the presence of steam-driven vehicles. Besides, who could foresee that trackless propulsion would reach its present stage, and had anyone foreseen it he would have schemed up a way by which such a dangerous hustling along public roads might be made illegal.

In Colorado there is a law requiring a boy or a man to be placed at every mine door. If these doors were made self-acting such an attendant could be dispensed with. But the law did not contemplate the introduction of such doors, and so the boy had to be employed. In no other state is there a provision requiring an attendant at all doors.

State Senator Tong, of Denver, drew up a bill making it possible to dispense with door-tenders when automatic doors were provided, and he presented it to the legislature in February of the present year, but no action has so far been taken. This bill should be passed, for the old law requires the mine to be worked inefficiently.

A man engaged in opening and closing a door is a lost economic unit till he is moved to some other place, whether he is a flunkey in a uniform or a less gorgeous individual sitting on a soapbox. We talk glibly about the conservation of human life. No one can better conserve it than by keeping it at useful labor and such labor only.

Where men work at an unnecessary occupation, not only do they degenerate mentally and morally, but they consume the product of real workers while they contribute nothing to the welfare of mankind. Many an individual of admirable qualities fills a useless office or none at all, and such men may well be said to be effecting less than nothing.

A door-tender is less reliable than an automatic door. He may leave it open or may fail to open it when such opening is necessary. He is as fallible as a signalman and may be even more likely to fail, for rarely are the better grade of men chosen for the work. Why, then, keep in operation a law by which his services are compulsory?

Uncertainties in Statistics

So few are the states that are securing statistics of the nationality of mine workers and such a considerable service is being rendered by those that are doing this work that criticism may well be avoided lest it discourage others from following such a worthy lead.

The men being enumerated cannot, for the most part, speak English, and some of them are not able to read or write. As a result it is hard to make clear to them whether a national, ethnological or linguistic statement is desired. In fact, is the inquirer himself quite clear as to the information he is seeking?

Some men, for instance, declare they are Poles. This may be true ethnographically, but it does not state whether they should be classed as inhabitants of Russia, Austria or Germany. Other Poles might say they were Russians, Austrians or Germans and thus muddle up the record if Poland were regarded as being of such ethnological importance that people of that race should be segregated in the record.

The Bohemians largely speak German, and as they are more friendly to Germany than to Austria, in many cases are likely to class themselves linguistically and by sympathy rather than nationally.

The only safe plan is to ask the man when employed what country he comes from and who is the ruler of the country. From his two answers it will be possible to tell his nationality without uncertainty. If it is desirable to divide the inhabitants of the British Empire into Englishmen, Scotchmen, Irishmen, Canadians, Australians and so forth, that can well be done because the inquirer will be dealing with clearly defined units. But any such attempt in central Europe will result in overlapping schedules and resultant uncertainty.

At best, however, our statistics will never be really accurate. It will be impossible to iron out the Balkan muddle. No man of Bulgarian race would declare he was a Serbian even if the Serbian ruler reigned over the village in which he was born. This is true of all Serbia, but especially of that area where the Serbians have recently dispossessed the Turks and annexed large numbers of Turkey's Bulgarian subjects.

The problem should be settled by some authority on European conditions when the present war is over and the national lines are newly defined. Then we may be saved from divisions like Horwat, Granish and Slavish, the former classes not having recognition in a dictionary and the latter being so large a term that it includes citizens of Russia, large parts of Austria, Serbia, Bulgaria, Montenegro, Turkey and Roumania.

How Coal Operators May Spend Their Money

We shall not discuss whether coal operators have money to spend. Profits are small; in many cases there are none, but the men who operate mines have money, whether they have made it in coal mining or in some other way.

Many of them are admirable citizens where they live, giving their money freely to every public work and trying to make their home towns desirable places for rich and poor to live in. But surely if they are bestowing their largess on any worthy object they may well spend much of it in making their coal towns desirable. If they are spending money, as many of them are, for the benefit of people who have no claim on them, why not spend some on the villages where they have a large responsibility, even if from the industries of those villages they do not receive a large return?

Just as Washington gives its millions for fine buildings and a magnificent station and then begrudges a country village a decent post-office, so a man will build a fine church or endow a splendid hospital in a city for people who never had any relations with him and will leave the village where his workmen live without any of the institutions which dignify life and remove suffering.

We are not concerned with the argument whether the man who mines coal or the man who buys it is most entitled to the bounty of the rich man who happens also to be a coal operator. The important question is, Why should his favors go to the city and few or none to the village, for if he has money to spare, it will go further in the mining camp than in the large city?

Doubtless no one will appear extremely grateful to him for his generosity should he give of his bounty to improve his mining towns, and some will say it was done to curry favor with the workingman or to increase efficiency or for any other reason than the true one—generosity; but the condition is similar in cities. In a large city there are like innuendoes wherewith it is customary to assail benefactors. In fact, wherever money is given, men of little mind who never parted with a penny without physical violence will invent a thousand reasons to explain away a generous instinct.

It was Ruskin who said that the architects of earlier centuries spent as long and loving attention on the rear of the monastery as on its facade, and it would be well if we, today, tried to make a democracy of towns instead of having on the one hand magnificent cities and on the other villages that are no credit to us. Mining villages may never be stately and magnificent, but they can be sweet and dwellable; and with the delights of the country to aid the human comforts provided, the village may be made more attractive than the city.

Can Someone Enlighten Mr. Le Baron?

The manager of Coal Age, William Le Baron, has asked the editorial staff why it is necessary for the coal industry to be always in a strike turmoil.

The editors unfeelingly declared the question extremely stupid, but finally offered to put the query to the readers of the paper. They may, in their united wisdom, be able to answer it. The editors cannot.

Sociological Department

The Short-Cut to Safety First

By C. Rae King*

SYNOPSIS—Though many accidents will still occur to temperate men, yet the Safety-First movement will never attain its greatest efficiency till men working in and around the mines reduce their consumption of alcohol. No propaganda for safety are complete till a temperance movement is made a part of the attempted reform.

Mining journals for the past year or so have been well filled with articles telling us about "safety first"—how to elevate the foreigner by welfare work and how to reduce accidental suffering by first aid. Many of these articles have been descriptive of methods so expensive and elaborate as to be out of the reach of the smaller coal-mining corporations.

Moreover, while many of the safety, welfare and first-aid plans have been carried out with more or less success, in most cases the workers in charge have failed to realize that so long as the managements of coal companies, particularly of those which own their own towns, permit the unrestricted sale of liquor to the workmen in their employ, welfare work is being undermined, first-aid treatment made more necessary and safety is put last instead of first.

A Street in Greenwald with Concrete Ditches

Hall of the Greenwald Temperance Society

Legitimate Merchandise Excluded and Yet We Fear to Restrict a Dangerous Trade

The question promptly arises, Can this excessive distribution of liquor in mining towns be prevented? We smile at this question when we think how recently the common practice of coal companies was to keep all outside merchants dealing in the necessities of life from coming into their towns and selling to their workmen in competition with the company store. In fact, if I remember correctly, the practice was so unjust that legislation attempted to divorce the company store from the coal operation and thereby lift the embargo thus placed on the outside merchants. With this knowledge before us is it not reasonable to assume that, if it was possible to keep out those who sold necessities of life, it is now also feasible to exclude those who sell an article which puts life in jeopardy?

As a matter of fact the amount of intoxicating liquors furnished a mining town can be regulated if the management so desires. Of course, if any of the officials connected with the coal company have a pecuniary interest in the traffic the restriction becomes more difficult.

A Village Relieved of an Overload of Liquor Will Make Progress in Safety

We assume that it will be readily granted that if the overload of liquor furnished the foreigner—that is, the amount in excess of what is "enough" (which of course will vary with each individual's point of view on the liquor question)—was kept out of the mining communities, the too frequent murders, riots and accidents would proportionately decrease, and immorality and uncleanliness largely disappear. Let us also admit, for the sake of argument, that under these improved conditions welfare work would find a more fertile soil in which to develop. The necessity for first aid would be lessened, as some causes of accidents and sickness would be at least partly eliminated, and safety first would become a reality.

Let us be honest and also admit that it stands to reason that if dealers in the necessities of life can be prevented from soliciting or trading in coal-mining towns, then agents, solicitors, representatives of the breweries, or whatever we may desire to call them in order to shade the law, may also be prevented from soliciting and otherwise promoting the liquor traffic in mining towns if we, as managers, so desire. We are all ready to admit freely that if this could be done it would result in conditions such as we have long sought in vain.

We hear some coal operator arise and protest in a loud voice that " 'it can't be did,' that the labor situation would not permit of any such action, and that the foreigners, in spite of all which any coal-company management can do, will not stay where they cannot have their intoxicating drinks"—also, I may add, their murders and riots. Just as the coal operator makes this profound observation the advocate of personal liberty makes a loud noise and says, "Amen."

To all those who believe that the alcoholic curse cannot be controlled the following method is submitted, with

---

*Mining superintendent, Donahoe Coke Co., Greenwald, Penn.

Even When It Is Wet the Children Can Play in Open Air and Without Annoying Parents

the assurance that if it is liberally and consistently applied it will make possible that which they believe cannot be done and will make efforts in welfare, safety and first aid more worth while.

Hire Your Own Liquor Agent and Make It Worth His While to Restrict Sales

Select one of your trusted workmen—one who is willing to take the regulation temperance pledge, minus the "touch and handle"—and have him act as the brewers' representative or agent. This will only interfere with his regular work for one-half day each week.

He assumes this responsibility with the direct understanding that he is employed by the brewery, but as the wages paid him by the coal company are to increase as the quantity of intoxicating liquors consumed in the town decreases, and as from the first the wages he receives from the coal company are to be increased over what they formerly were, he agrees to donate to a temperance society all the salary or commissions he may receive from the liquor interests.

After you have secured control of the liquor agent, keep all the other salesmen of intoxicating beverages out of your town just as you used to expel the other agents or possibly as you are even now excluding the hucksters and peddlers. Have the agent in your control furnish you with a record of the liquor ordered by each house for the week, and you will then be in a position to regulate the amount of liquor going into your town.

Children's Playground at Greenwald, Penn.

See that the agent obeys the law. Require of him that he "gather up" the orders on a certain day of the week and at a time when the men are working. Thus he will obtain his requisition from the women. He must refuse orders from anyone who is not a renter.

Temperance Clubhouse, Supported by Liquor Agent

Have a building constructed, if you do not have one, measuring say 24x75 ft., with a basement of the same size. Heat and light it, put in hot and cold water, baths, showers, etc., and then send out word to your employees that the building will be turned over to a temperance society for its exclusive use, provided it can secure a charter membership of at least 25 men and will operate the building under rules and regulations satisfactory to the company. The building and all its equipment will be free to the members of the society.

Also circulate the information widely that the society will not be without funds as the liquor agent has stated that he will donate all his liquor commissions or salary to the cause. After the society has been formed and is in operation, the agent voluntarily donates his liquor commissions or salary, and with these funds the society furnishes its rooms with pool and billiard tables, music, bowling alleys, card and reading tables and other forms of innocent amusement. It also proceeds to prepare articles of incorporation and to secure a charter.

A Greenwald Garden with the Mining Plant in the Rear

The membership will grow rapidly; your employees will have a free place of recreation; the agent will be satisfied as he watches the liquor business decrease and his wages grow larger; the foreigners will associate with your better class of Americans, will absorb their ways, learn their language and methods, and greatly improve themselves in every way. The wives and children will be happy because "dad" has cut out the "booze" and begun to save money.

His associates will be of a better class, and it will soon be apparent that his supply of profanity and vulgar talk is decreasing and that he is becoming a cleaner and better man and also a more desirable workman. Each member becomes a personal worker for temperance in your town, and you will soon find that this temperance society will develop into a self-running machine, separating the lump from the slack among your employees. Once in motion it is automatic, managed directly by the better class of workingmen and lubricated indirectly by liquor money.

Plan Will Stand the Test of the Courts

Some ask if this plan will not conflict with the liquor laws. No, it will not. All you have to do is to follow the methods of the liquor interests; let them find the way—and you can rest assured that they will. Even though there were a shade of doubt, would it not make an interesting case to observe the commonwealth prosecuting a temperance society for violating the liquor laws, having as its sole evidence that the system had reduced sales?

The next question comes from the "dollar and cent" man. He wants to know where the company comes in? How will it be reimbursed for the extra wages it pays the workman who acts as the liquor representative and for the temperance hall and other expenses in connection with the same? This reimbursement cannot be proved on paper in dollars and cents, but anyone who has ever been closely connected with the management of a coal company and mining town would not ask such a foolish question. Sober and industrious workmen mean prosperity and wealth.

The following are the rules which have been adopted by one such society and are given at length as a sample from which a draft of rules can be made to suit the requirements of any particular plant.

RULES REGULATING GREENWALD TEMPERANCE SOCIETY

The purpose of the Greenwald Temperance Society is to encourage temperance among the workmen of the Donohoe Coke Co. and to oppose all influences tending to promote or create intemperance, also to provide a place for social gatherings, recreation and amusement, and to create a moral atmosphere tending toward the elevation and bettering of the members.

DONAHOE MINE NEAR GREENSBURG, PENN.

Election of New Members

To become a member of this organization it shall be necessary, in addition to the other requirements herein stated, that the applicant shall be over 18 years of age, of good character and have taken a pledge before a priest, notary public or justice of the peace to abstain from the use of intoxicating liquors for a period of one year. This pledge, together with a deposit of $5 as additional evidence of good faith, shall be presented to the secretary of the society, who will provide the new member with a membership card entitling him to all the privileges of the association.

Previous to the pledge and deposit a vote shall be taken on the application at a regular meeting of the society. Any candidate receiving over five black balls shall not be eligible to membership. In the event of his election he shall continue to be a member so long as he violates no pledge and is not for other causes, as herein provided, removed by the society or its official board.

Withdrawal and Expulsion from Membership

In the event that any member in good standing for any reason wishes to withdraw from the society he may so notify the president, who at a regular meeting of the official board, shall secure his money deposit for the member.

When any member is removed from membership he shall forfeit the money he has deposited. He cannot apply for reinstatement within a period of one month and shall pursue the same course as a new member, except that he shall be required to deposit $10 as evidence of good faith.

Only employees of the Donohoe Coke Co. or of John P. Donohoe & Co., Ltd., shall be eligible to office or membership. The following officials of the Donohoe Coke Co. shall be ineligible to office: The superintendent, mine foreman, chief engineer, coke-yard foreman and the chief clerk. An officer's term of service shall be one year unless terminated at an earlier date as herein provided.

The membership of any officer or member shall terminate at the time he leaves the employ of the Donohoe Coke Co. or of John P. Donohoe & Co., Ltd. Should an officer withdraw or be removed the vacancy shall be filled at the first regular meeting.

Duties of Officers

The officers of this society shall consist of a president, vice-president, secretary, treasurer and assistant secretary. They shall be elected by the members of the society at the regular annual meeting to be held on the first Monday of March of each year. Candidates receiving the highest number of votes shall be elected. All elections shall be by roll call.

The officers, in adition to their regular duties, shall act as a jury before which all cases, not otherwise provided for herein, shall be decided. Thus they shall place fines, provide for their collection, remove members for violation of their pledges, disorderly conduct or other causes herein stated and investigate charges made against any member. They shall have the power to summon before them any member for the purpose of obtaining evidence or information relative to the cases on trial or for the welfare of the organization.

A majority vote of the members of this board, which vote shall not be revealed to those not on the board, shall be final in all cases not otherwise provided herein. This official board shall hold its regular meetings on the second and fourth Mondays of each month.

Rules for Meetings

Standard parliamentary rules shall govern all meetings. Upon petition of 10 members the president shall call special meetings, the same to be well announced among the members. Upon petition of 10 members presented at a previous regular meeting a vote shall be taken for the removal of any officer. A two-thirds vote by roll call shall remove the officer from office and the vacancy shall be filled at the same regular meeting.

The regular meetings of the society shall be held at their rooms on the first and third Mondays of each month, beginning at 8 p.m. The meeting-rooms of this society are not to be kept open later than 10:30 o'clock on any evening other than Saturday; on Saturday evening they shall not remain open later than 11:30 o'clock.

The rules of this society shall not be changed or altered except by the consent of the Donohoe Coke Co. and a two-thirds vote of the members present at a regular meeting, notification of proposed changes having been given at the previous regular session.

Disciplinary Rules

No profane or obscene language will be permitted, nor gambling or rowdyism. Each offense, until more drastic action, which may be removal from membership, is taken by the official board, shall be penalized by a fine of 10c. for each offense, to be paid to the treasurer no later than the first regular meeting.

No one other than a member shall be permitted in the society's rooms except a visitor from out-of-town accompanied by a member who shall assume all responsibility for the visitor's behavior. The only exception to this rule shall be on special occasions after the society at a regular meeting so decides by a two-thirds vote. It may then, if permitted to do so by the Donohoe Coke Co., arrange to entertain its families and friends.

Breakage or damage of any equipment or furnishings or the meeting-rooms shall be paid for by the members responsible for same. No books, papers or any furnishings or equipment of any kind shall be taken from the rooms.

Provisions for Support

The building, with its heat, light and water and connections thereto, will be furnished without charge by the Donohoe Coke Co., and the amusements and fixtures will be donated by the welfare committee without charge. The use of the building and the equipment will be furnished to the Greenwald Temperance Society with the direct and positive understanding that it is to be used for no other purpose than that provided in the rules and regulations governing the society, and should it be used for other purposes not in accordance with the said rules and regulations or against the wishes of the Donohoe Coke Co., the latter reserves the right to close up the building without notice.

Discussion By Readers

Recognition of Bravery

Letter No. 14—I have been greatly interested in the discussion of the question of the recognition of bravery on the part of mine workers who attempt to rescue their fellows in peril. I was particularly impressed with Letter No. 13, Coal Age, May 8, p. 819, by Sim. C. Reynolds, in which he refers to the sad death of his friend and companion, John Lyle, when they both risked their lives in the attempt to save others entombed in the fated Harwick mine, Jan. 29, 1904.

The incident calls to my mind a similar one in my own experience when a brave miner gave up his life in an effort to rescue two fellow-workers who had been entombed behind a heavy fall of roof. Although he was warned that it would be unsafe to attempt to reach the entombed men through the old abandoned workings that had been sealed off as they were full of blackdamp, he disregarded these admonitions, replying that God would be merciful to him in his attempt to save the lives of those in danger. His sacrifice was not without avail, however, as he succeeded in tearing down two brattices, which permitted fresh air to reach the men behind the fall and keep them alive until succor was afforded.

The sad sequel of this incident is that while one of the rescued men has since become wealthy, having quit mining and gone into a mercantile business, the wife and four children of the man to whom he owes his life are suffering today for the lack of support. It is sad to think that, while that man is living in comparative luxury, his brave rescuer lies in a grave unmarked save by a wooden slab and his poor family are deprived of the comforts of life.

I hope to see this discussion continued until some adequate and practical plan shall be developed whereby brave men who take chances and face death without a thought for their own safety will receive due recognition. The writer of Letter No. 12 suggested that such recognition should take the form of suitable mention in some good mining paper such as Coal Age. This is very good and the idea of conferring a medal is well enough, except where the rescuer is incapacitated for work or loses his life in his attempt. It would seem then that there should be more adequate provision made—something that would be more practical and of greater assistance to those who have been deprived of their support.

I am inclined to believe that the state or national government might well establish a fund having for its purpose the support of the widows and orphans of these brave, big-hearted men who willingly give up their own lives in an attempt to save the lives of their fellows in peril. Attention has been drawn to the fact that such a provision for loved ones would relieve the mind of the rescuer and enable him to go forward with a braver heart and with greater assurance of success. The thought of the loved ones who would be left without his support is the one burden he now carries and which should be taken from him.

As I said before, I hope that the discussion of this question will continue and that we shall have one or two letters each week bearing on this matter, until some good is accomplished and effective means adopted that will greatly assist in the work of rescue.

Ostel Bullock.

Cleaton, Ky.

The Mine-Car Question

Letter No. 1—I read with great interest the article by R. Z. Virgin, Coal Age, May 1, p. 752, relating to the question of suitable mine cars. This is an important question, and I presume from the tone of the article that Mr. Virgin, like some of the rest of us, has been up against a serious proposition in that regard. Mr. Virgin's comments on the changes that have taken place in coal mining in this respect during the past few years are important, and coming from a man of his experience, cannot fail to attract the attention of all mine superintendents.

It frequently happens that mine managers and directors who are not personally acquainted with mining conditions often regard the suggestions of their superintendents as calling for improvements in equipment that are unnecessary. At times they may even conclude that owing to their lack of intimate knowledge of practical mining conditions they are being imposed on by the superintendent in charge who advocates such changes in equipment as Mr. Virgin has pointed out, as for example the adoption of a lighter and a cheaper mine car.

Recently I have advocated to the management of our company replacing the old style of cars now in use in our mines with modern, uptodate, roller-bearing cars of size and capacity suited to the seam that we are working. At the present time we have a 2-mi. haul underground, which will gradually increase as the mine develops. It is important that the cars should be built strong and durable to avoid the necessity of frequent repairs and the delays incident to breakdowns and wrecks that are unavoidable in the use of poor equipment. Such cars will also reduce the cost of operation, not only by reducing the power required for hauling, but by increasing the ease of handling the cars at the face.

My mining experience of 30 years in the coal fields of Alabama, Kentucky, Pennsylvania and Tennessee, which includes work in all the departments of mining and in all classes of mines, has taught me that it is economy to build a car suitable for the work and adapted to the size and nature of the seam and the haulage system employed. After 15 years of service as superintendent and engineer of mines I realize that this is a matter of more importance than is generally supposed by those not in touch with the daily operations underground.

All practical mining men realize that the further the mine workings advance into the mountain the more necessary it is to provide for an additional expense in relation to the haulage of coal, ventilation of the mine, upkeep of roads and airways, and drainage. More pumps and pipe lines, larger and heavier rails, more copper wire and other items too numerous to mention are required because of the greater development of the mine.

Under these conditions, in order to maintain a low cost of production it is absolutely necessary to employ improved methods and equipment that will reduce the cost of operation as much as possible. An important factor in this consideration and by no means the least is the style, size and capacity of the mine car.

I hope to see this question thoroughly discussed in Coal Age. I want to say that I have been greatly interested in the practical discussions that have taken place in this paper since its publication first began. I am personally acquainted with many of the men who have taken part in these discussions, but have refrained from doing so myself, which perhaps I should not have done.

P. F. Lynch, Superintendent,
Cross Mountain Coal Co.

Briceville, Tenn.

Stopping Payroll Leaks

Letter No. 3—For a long time I have been an interested reader of Coal Age. There have been many important things mentioned, but it seems to me there is not enough attention given to the small and apparently insignificant points in coal mining. Some time ago Coal Age invited a discussion of the leaks that occur in coal company accounts, Vol. 6, p. 2. Since that time I only remember seeing two articles regarding the matter, and these both referred to the handling of the accounts by the mine foreman and the payroll clerk, but made no reference to the many leaks that occur through improper management of the work underground.

I want to call attention to a few of these small items, and while I do not claim that these are lost sight of by many mine foremen, I must say they are often neglected to a great degree. It is these *small* leaks underground that increase the cost of coal production.

On visiting many mines it is common to find a lack of proper drainage on the haulage roads. Almost every mine has some swamps and low places where water will accumulate unless a proper system of drainage is provided. I do not mean to say that mine officials generally do not understand the importance of keeping the roads well drained, but they allow this work to be set aside for more important matters.

I recall one instance of a mudhole on a motor road that lubricated the rails for a distance of ½ mi. and caused a loss of 10 min. in the time required to make a trip, besides necessitating the use of a half-bushel of good sand each day and the waste of much power. In addition to all this, the roadbed in such places becomes soft and requires much attention to keep the track in repair. I recall another instance where the tracklayer, upon starting to clean out a short drain, was called away to another job. Later, upon his return, he was obliged to put in two full shifts, lining and leveling the track under two 40-lb. switches from beneath which the motor had squeezed the fireclay. Had the drain been kept clear, this labor would have been saved.

Another trifling loss occurs through the frequent grounding of the electric wires carrying power into the mine. Any one of these grounds, taken singly, is hardly worth considering, but taken together, the loss is considerable, as shown by the ammeter.

Upon taking charge of a plant some time since my attention was drawn to the ammeter registering 75 amp., after the work in the mine had ceased. I first supposed that this was due to some pump in operation, but I found later that there was no machinery of this kind on the line. Investigation showed that about 25 of the trolley-wire hangers were grounded in the sandrock roof. When these were replaced with new hangers, the ammeter read zero after the cessation of work.

A simple calculation will show the loss from this leakage of 75 amp. under a pressure of 275 volts, being continuous for the time the switch on the supply current is open, which is 16 hr. a day. This loss in six months of 125 working-days of 16 hr. each, or say 2000 hr., would amount to $(75 \times 275 \times 2000) \div 1000 = 41,250$ kw.-hr. At a cost of 2c. per kw-hr., the loss would be $41,250 \times 0.02 = \$825$ in six months. In the present case, the loss being due to the leakage of current by the grounding of 25 trolley-wire hangers, the loss is $825 \div 25 = \$33$ per hanger in six months, or $5.50 per hanger per month—an amount that is almost inconceivable. However, it shows the importance of carefully testing an electric circuit for grounds and locating and stopping the leak. Besides this direct loss of current, there is the danger from fire where the hangers are in the coal roof or insulator pins are used instead in the entry ribs.

I do not want to convey the impression that a mine foreman, assistant or fireboss has overlooked these points where losses occur, but because I believe they are of sufficient importance to deserve prompt attention. It may be of even greater importance than the shooting of a hill or grading of a swamp to enable the motor to put out more coal in less time and with the use of less sand and less power, to say nothing of less wear and tear on the motor. These little leaks are of vastly more importance than the installation of an improved pump or motor to cut down the expense for power. As a rule, these larger jobs require very little thought on the part of the foreman, because they originate and are carried out by the men higher up. They assume the responsibility for these greater changes, but the mine foreman and his assistants must watch the small leaks that do not commonly show until the end of the year.

Co-operation in Coal Industry

Letter No. 2—The question of coöperation on the part of all interested in the mining of coal is an important one. It has many sides, and there is as much need for coöperation underground in the actual mining of the coal as there is in the marketing of the product, which was referred to in Coal Age, May 1, p. 777.

I attended a meeting not long ago that was called by a local union for the purpose of discussing with the mine officials the question of loading dirty coal in the mine. I was greatly surprised at the position taken by the men of this local. The company was represented in the meeting by the general superintendent, his assistant and the mine superintendent. Letters were read that had been received by the company complaining of the character of the coal as being "very dirty."

After the reading of these letters the officials talked to the men from a *practical* standpoint—not as a blacksmith would attempt to tell a cobbler how to mend shoes. They showed the men that they had spent the greater part of their lives in the mining of coal and its preparation for the market. Their knowledge had been gained by practical experience. They made it clear that unless some measures could be adopted for putting out cleaner coal the company would soon be unable to operate its mines. It was proved by statistics that 95 per cent. of the men in the valley produced their coal by what is known as the "snubbing system."

In response to this appeal, however, no effort was made by the men or the officials of the union to remedy the trouble and coöperate with the officials in this matter, which was as much to their own interest as to that of the company.

To explain, the "snubbing system" of mining coal consisted in removing the binder that formed the lower layer of the coal seam, before attempting to shoot down the coal. The removal of this binder would permit the coal to be shot down more easily and allow it to roll over in readiness for being broken up for loading.

The "snubbing" also permits the miner to separate the binder from the coal in large slabs so that the coal loaded into the cars is much cleaner than it would be otherwise. When the binder is not thus removed before shooting the coal, it is practically impossible to clean the coal thoroughly as the binder is very similar in appearance to the coal.

Furthermore, to shoot the coal before removing the binder requires a heavier charge of powder, which breaks up the coal and makes much of it unfit for the market, besides creating a great quantity of fine coal and dust, which endangers the operation of the mine. If the charge of powder used is so small as to prevent the breaking up of the coal in this manner the result is what is termed a "standing shot." The miner must then undermine the shot and remove enough of the binder to permit the coal to fall or roll over. This not only requires much extra labor, but is dangerous, as the coal is liable at any moment to fall on the miner at work beneath.

When this matter had been presented to the men in a most friendly way, a few of them voiced the sentiments of the majority. One man said: "When you snub the coal, it just slips down before a shot can be fired, and it is hard then to roll it over. On the other hand, the shot does the work and throws out the coal ready for loading." This argument would seem to declare that a *square block* would roll over more readily than a *ball*. It may be asked, If this claim is true why have 95 per cent. of the miners in that vicinity used the snubbing system of mining the coal for 25 years and not discovered a better method?

Another man stated that before shooting his coal he "blocked it up with cap-pieces and ties." In other words, he practically closed up the space made by the machine, which had the same effect as "shooting the coal off the solid." The argument amounted to saying that in order to upset a house the first step would be to brace it with supports.

Another man said: "The dirty coal sent out is due to the method of distributing the cars in the mine. The turn of *two* men working in two places is seven cars having a capacity of 1½ tons each, while the turn of a *single* man is four cars, in an 8-hr. day." He did not attempt, however, to show in what manner this operated to produce the dirty coal.

This discussion was without any practical effect, as no attempt was made by the officials of the union to induce the men to load cleaner coal. In my opinion, the result was very discouraging to the officials of the company and showed a great lack of coöperation on the part of the men.

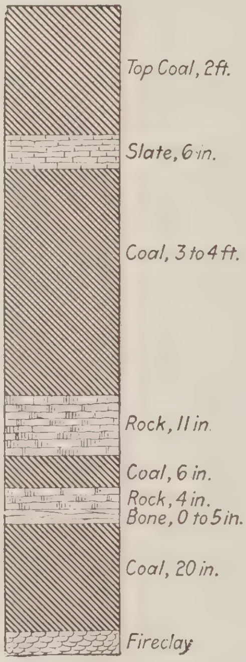
A Timberman.

Caldwell, Ohio.

Labor in Mining

I want to add a few comments, in connection with the labor trouble described in Coal Age, Apr. 17, p. 687. Reference is there made to the demand for a reduction of 10 per cent. on all day labor and 5c. on each ton of coal at the No. 2 plant of the Atlantic Coal Co., near Meyersdale, Penn. I thought a few items would be of interest in this connection.

The mine is located in the Somerset County field, and the seam being worked is so close to the surface that there is no solid roof above the coal, as far as I could see. In a few places there is a sandstone that comes in, but this has many cracks that make it dangerous when mining the coal. The accompanying sketch shows a vertical section of this seam. The 2 ft. of top coal is generally left in because it serves as a good roof while mining the coal in the middle seam. The middle seam of coal is from 3 to 4 ft. in thickness and has a high commercial value. The top coal can be taken down in some of the rooms, and this also has a good heating quality. These two seams of coal are separated by 6 in. of slate parting. Underlying the middle seam of coal is a 11-in. rock binder, beneath which is 6 in. of coal, then a second 4-in. binder underlaid with a seam of bony coal, varying from almost nothing to 5 in. in thickness. Below this is 20 in. of bottom coal, with 1 in. of bony in the center. The miner is compelled to shoot this bottom coal with dynamite, as powder becomes too wet before the shot is fired. This means 25c. extra for every shot fired at the bottom.



Owing to the bad roof, the miner is compelled to set crossbars at least 4 ft. apart. These crossbars are 10 ft. long and from 6 to 8 in. in thickness. It is necessary to set these crossbars in every working-place.

Six handpumps are used to drain the mine, which makes considerable water. The mine cars have a capacity of 2 tons each, and a 42-in. track-gage is used. Mules are employed for the gathering haul in the inside workings, while a gasoline locomotive hauls the cars from the inner parting to the mine entrance. On the outside a dinkey engine is used to haul the cars in 20-car trips from the mine to the tipple, a distance of about 3 miles.

The reader can judge for himself whether the company was justified, under these conditions, in demanding the reduction in wages paid for labor in the mine. Briefly stated, the facts are about as follows: The Atlantic Coal Co. paid its miners 60c. per ton for pick-mined coal and

50c. for each crossbar timber set in a room or heading. The working day was 10 hr. Tracklayers were paid $2.75, drivers and all inside laborers $2.50, while outside men received $2, and men working on the tipple $3 a day.

Last fall it was found to be necessary to reduce expenses in the mine. Accordingly, the price for setting crossbars was reduced to 25c., and all daymen were cut from 5 to 30c. a day. The result was a strike that lasted but a few days, when the men returned to work.

Again, last winter, owing to the low selling price of coal, another cut was made, and this time the price of mining was reduced 5c. a ton, but no cut was made in the wages for daymen. This caused dissatisfaction, and the miners came out, but returned after two days of idleness.

Following this, on Apr. 1, the president of the company, Frank Black, issued a notice of a still further reduction of 5c. per ton in the price of mining, making a total reduction of from 60 to 50c. per ton. A notice also stated that no payment would be made for crossbars in rooms, crossbars in headings remaining at 25c. each. All daymen suffered a 10-per cent. reduction, which made their wages $2.22½ inside and $1.80 outside the mine. As a result, all the miners came out on a strike.

I might add that the mine entries ran into a fault, which extends across the whole property. The company paid eight men good wages that ran from $2.45 to $3 a day to cut through this fault. All extras were furnished by the company.

Immediately following the strike, Mr. Black came down to the mine and held a brief conference, in which he stated that, were the company to pay the former wage scale, they would soon be in the sheriff's hands. The result was that many miners left the place, while the remainder returned to work.

Much credit is due Mr. Griffith, mine foreman and superintendent, who thoroughly understands general mine practice and is quick to adopt suitable methods in the operation of the mine. Many miners view conditions from their own standpoint and are prone to think that a company should not start to open a mine under the conditions they frequently find to exist in underground workings. They blame the company for not thoroughly prospecting the entire ground and preparing beforehand for the conditions that may be expected. Under the bad-roof conditions that exist in this mine, it would no doubt have been better to adopt a narrow track-gage and use smaller cars that one man could handle readily and that would have enabled them to do away with crossbars and eliminate that expense.

JOHN MAJER.

Garrett, Penn.

Study Course in Coal Mining

By J. T. BEARD

The Coal Age Pocket Book

Causes of Mine Explosions—The causes of mine explosions may be generally stated as the ignition of gas or dust by one of the following causes:

1. By the use of **open lights** or **defective safety lamps** in mines where the air current is charged with gas or dust, or where gas has accumulated in void or abandoned places in sufficient quantities to be dangerous.

2. By the use of **mixed lights** in mines generating gas.

3. By the **inexperienced** or **careless use** of a safety lamp, or by **fooling** or **tampering** with the lamp, or **exposing it to gas** too long or to a **strong gas blower** or **strong current** or blast of air, or carrying **too high a flame.**

4. By the use of a **dirty lamp** or one that has been improperly assembled or injured by a fall or other accidental cause.

5. By the **explosion of powder** in blasting or the accidental explosion of a keg of powder, or the flame of a **blownout shot** or a **windy shot.**

6. By the use of matches or other means of lighting.

7. By the sparking of **electric wires, switches** or **brushes,** or the blowing out of an **electric fuse,** or the breaking of an **incandescent lamp.**

8. By the **spontaneous ignition** of oily waste carelessly thrown aside, or of fine coal or slack in the gob.

9. By the fall of certain hard roof **rock striking sparks,** as claimed in the Bellevue mine explosion (1910), Alberta, Can.

10. By the possible **generation of heat** due to concussion of the mine air in contracted workings in thin seams.

Prevention of Mine Explosions—No means has yet been devised that will insure absolute freedom from mine explosions. But the tendency to explosion and the frequency of these occurrences can and has been greatly reduced by studying their causes and adopting measures to remove them.

The following points are of chief importance:

1. Effective mine regulations and discipline.

2. Operation in accordance with the state mining law.

3. Enforcing by suitable penalties all mine regulations.

4. Thorough frequent inspection by competent men.

5. Education and training of all men employed in any capacity in the mine, in respect to the proper performance of their duties, the dangers to which they are exposed and the mining law and mine regulations in force.

6. Eternal vigilance of mine officials and a regard for safety greater than the desire for increasing the daily output of the mine.

7. Coöperation of employers and employed in increasing the safety of mine work.

8. Coöperation of all coal companies in respect to mining requirements.

Aside from the above general outline there is the necessity for each company to study carefully the conditions existing in its own mines, and to adopt a system of inspection and methods of ventilating the mine and mining and hauling the coal that will produce the best results and insure the greatest freedom from accumulations of gas and dust on the roads and in the workings. Immunity from explosion can only be secured by removing the cause.

The Coal Age Pocket Book

Mixed Lights in Mines—By "mixed lights" is meant the use of **open lights** in one or more sections of a mine in which gas is generated in other portions of the mine in sufficient quantity to require **safety lamps** being employed therein. The expression does not refer, however, to the use of open lights by drivers, triprunners or motormen whose duties are confined to the main intake haulage roads and shaft or slope bottom of a mine worked on safety lamps, provided there are lamp stations beyond which these men may not pass.

The use of mixed lights is a **dangerous practice.** The danger does not consist wholly in a man carrying an open light into the safety-lamp section, or to a foreman or fireboss forgetting that he has an open light on his head while carrying a "safety" at his side. These are possibilities that can be prevented by properly safeguarding the entrances to the gaseous section.

The real danger lies in a heavy fall of roof occurring in the safety-lamp section and driving out the gas into other parts of the mine where open lights are in use. Or, a squeeze may develop in any part of the mine and permit the gas to find its way without warning into an open-light section and cause an explosion.

Electric Mine Lamps—Any installation of electricity in a mine worked on safety lamps is necessarily accompanied with more or less danger. Whether the installation is for the purpose of lighting, hauling, coal cutting or drilling, pumping or ventilation, it should be made by a competent electrician. The entire system of wiring should be closely inspected at frequent intervals and tested to insure freedom from short-circuiting or grounding of the current, which are not only wasteful of power, but may start combustion and result in an explosion of gas.

The use of **incandescent lamps** in mines has become so common that the Bureau of Mines has made a careful investigation to determine their safety. Their experiments show that **ignition of gas** may follow the breaking of the glass bulb of a lamp in an explosive mixture. The experiments also seem to indicate that the liability of ignition increases with the cross-section of the filament of the lamp. In the breaking of an incandescent lamp **two conditions** may arise that materially affect the possibility of the ignition of the gas. The same blow that breaks the bulb may or may not break the filament.

The result in either case may be briefly explained as follows:

1. If the **filament is broken** and its parts do not short-circuit the current ignition of the gas is not likely to occur. If the broken parts, however, fall across each other in such manner as to again close the circuit their burning out in the air will generally ignite any gas present.

2. If the **filament remains intact** when the bulb is broken it will burn out more or less rapidly, according to the manner of fracture and consequent inrush of air and gas. A small hole due to the breaking of the tip may admit the air so slowly that the gas is consumed without explosive violence. In that case there may occur a slight explosion within the bulb, which is not broken but only pierced. This feeble explosion, however, is not communicated to the outside gas.

Inquiries of General Interest

The Mine Car Question

I want to ask if it would not be a good idea to discuss the conditions that determine the size and capacity of mine cars in American coal-mining practice. It seems to me this would form a very interesting question for discussion.

In visiting different mining camps one is impressed with the great variety of mine cars in use, differing in size, capacity and form. While these are for the most part the result of practical experience in the particular section or district where the cars are used, in many cases the cars are ill-adapted to the existing conditions, but have been adopted more or less blindly without regard to the actual requirements for the economical and safe operation of the mine in question. These cars are of all sorts and sizes, including the dilapitated "hay-racks" that scatter their contents from the coal face to the dump. Many are large and cumbersome, making it difficult for the miner to handle them at the face and resulting in an unnecessary loss of time and a consequent reduction in the output of coal.

Too often in adopting a form or style of mine car, little or no consideration has been given to the thickness of the seam and the nature of the roof and floor. These features, together with the general inclination of the seam and the method of mining employed, greatly modify the style of car that should be adopted in order to insure the economical operation of the mine and the greatest safety of the workmen.

Permit me to suggest that a practical discussion of this subject in respect to the style, size and capacity of cars and the advantages and disadvantages of different track-gages for use under different conditions, would be of the greatest interest to all practical mining men. In order to unify the ideas and suggestions that may be offered in such a discussion, I would further suggest considering three thicknesses of seam in level formations and on inclinations where the haulage roads have 5-per cent. and 10-per cent. grades, respectively, as indicated by the following table:

Thickness of Seam	Haulage Road
3 ft.	Level
6 ft.	Level
10 ft.	Level
3 ft.	5-per cent. grade
6 ft.	5-per cent. grade
10 ft.	5-per cent. grade
3 ft.	10-per cent. grade
6 ft.	10-per cent. grade
10 ft.	10-per cent. grade

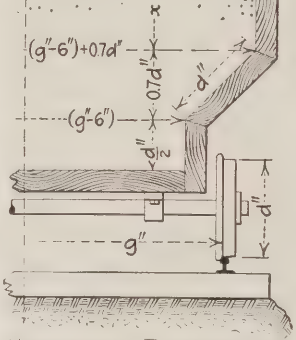
This will represent fairly well the different conditions under which cars must be handled in the mine. Reference should also be made to the character of the roof as being strong and permitting a good width of roadway, or frail and requiring a narrow track-gage and cars. While, as is well understood, a thin seam or a soft bottom that is liable to heave will often necessitate the adoption of a low car and the capacity must then depend on increasing the width and length of the car, it is also true that a frail roof will often require a narrower and longer car.

It would be interesting to know the size and capacity of the mine cars used in the longwall mines of Illinois and elsewhere, together with the thickness and inclination of the seam in each case.

SAMUEL DEAN, Mine Inspector,
The Victor American Fuel Co.

Delagua, Colo.

We are glad that Mr. Dean has drawn attention to this interesting question. His letter lays out a very simple, complete and practical plan. As a further suggestion that may assist those who will take part in the discussion and help to illustrate their ideas and make clear their meaning, we have prepared the accompanying figure or diagram illustrating one common style of mine car used in the bituminous region, in different sections of the country. In the figure, g = track gage; d = diameter of wheels and x is the vertical height of the coal above the spreading sides. The diagram is only suggestive, but enables the several dimensions of the car to be calculated for any capacity, track-gage and wheels. Assume a long ton of anthracite or a short ton of bituminous coal (mine run) occupies 1 cu.ft. Divide the desired tonnage capacity of the car by 40 to find the necessary cubic capacity. Assume a suitable inside length and calculate the other dimensions.



SECTIONAL DIAGRAM OF MINE CAR

*

Capacity of a Mine Locomotive

Is a 10-ton mine locomotive being operated at its full capacity or rating when drawing 150 amp. from a 250-volt circuit and running at a speed of only 6 mi. per hr.?

MOTORMAN.

Pittsburgh, Penn.

Before attempting to answer this question, it is well to estimate the power required to operate this locomotive at a speed of, say, 6 mi. per hr. (528 ft. per min.). Calling the coefficient of traction expressing the adhesion of the driving wheels to the rails 0.16, or say the tractive effort of the locomotive is one-sixth of the weight on the drivers, and taking the efficiency of the motors as 0.90, the current required to operate this locomotive at its full capacity at a speed of 6 mi. per hr. (528 ft. per min.) is

$$C = \frac{10 \times 2000}{6} \times \frac{528}{33,000} \times \frac{746}{0.90\,(250)} = say\ 175\ amp.$$

Therefore, since the question states that the motor is drawing only 150 amp., the locomotive is evidently not working at its full rating.

Examination Questions

Pennsylvania Anthracite Mine Inspectors' Examination, Held at Wilkes-Barre, Apr. 20-22, 1915

(Selected Questions)

Ques.—(a) How is the electric current generated before it is transmitted? (b) How is the transmitted electric power utilized? (c) Express the equivalent of 4.35 hp. in watts.

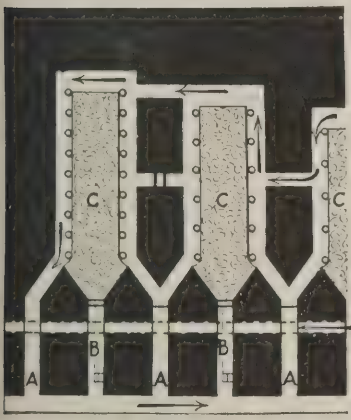
Ans.—(a) An electric current is generated at the power house by means of an electric dynamo called a "generator," which is driven by an engine at a very rapid rate. The rapid revolution of the armature of the dynamo between the poles of a magnet creates the current.

(b) The transmitted electric current is converted into mechanical power by an electric motor which is the same as the generator, except that the action is reversed, the current here acting to turn the armature.

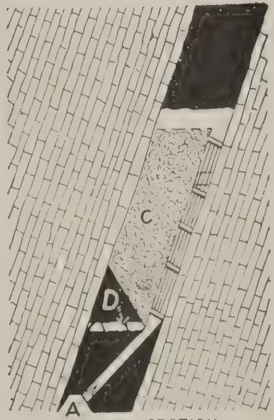
(c) $4.35 \times 746 = 3245.1 \textit{ watts.}$

Ques.—When the chutes leading to the breasts pass under the airway, what is done to restore ventilation to the rest of the breasts, in case the manway is closed by a cave-in? Show by plan and section.

Ans.—In the mining of steep inclined seams in the anthracite region, it is customary to drive a crosscut from the manway up to the airway above, as shown in the accompanying vertical section at *D*. The airway is commonly called the "monkey airway." By this arrangement it is possible to short-circuit the air at any point by carrying it through the crosscut on the intake side of the fall and allowing it to pass through the monkey airway, returning to the breast beyond through the crosscut at that point. The air current is thus carried over the breast in which the fall took place.



ELEVATION



VERTICAL SECTION

Ques.—The airways in a certain mine are 10x10 ft. and the rubbing surface 39,000 sq.ft.; the quantity of air required, 200,000 cu.ft. per min. (a) State the pressure, in inches of water gage, using $k = 0.00000001$. (b) If the diameter of the fan is 15 ft. and the volumetric ratio 200 per cent., what is the width of the fan, and at what speed must it run? (c) What is the horsepower on the air, and what should be the horsepower of the engine if the former is 70 per cent. of the latter? (d) What is the mechanical efficiency of the fan? Assume the actual water gage to be 60 per cent. of the theoretical water gage and the weight of air to be 0.076 lb.

Ans.—(a) The first step in the solution is to find the water gage required to pass 200,000 cu.ft. per min. in this airway, which has a sectional area of $10 \times 10 = 100$ sq.ft. and a rubbing surface of 39,000 sq.ft.; thus,

$$W.g. = \frac{0.00000001 \times 39{,}000 \times 200{,}000^2}{5.2 \times 100^3} = 3 \textit{ in.}$$

(b) Assuming, as stated in the question, that this actual gage on the air is 60 per cent. of the theoretical gage due to the action of the fan, the fan gage is $3 \div 0.60 = 5$ in. The peripheral speed, in feet per second, as calculated from this theoretical water gage, is

$$u = 47.25 \sqrt{w.g.} = 47.25 \sqrt{5} = 105.6 \textit{ ft. per sec.}$$

The diameter of the fan being 15 ft., the speed in revolutions per minute is

$$n = \frac{105.6 \times 60}{3.1416 \times 15} = 134.5 \textit{ r.p.m.}$$

The volume of the fan at this speed is

$$Vol. = 134.5\,(0.7854 \times 15^2)\,b = 23{,}770b \textit{ cu.ft. per min.}$$

Now, assuming, according to the question, that the volume of air delivered is twice the volume of the fan, in cubic feet per minute (volumetric ratio, 200 per cent.) $200{,}000 = 2(23{,}770b)$; and for the width of the fan,

$$b = \frac{100{,}000}{23{,}770} = 4.27 \textit{ ft., say 4 ft. 3 in.}$$

(c) The horsepower on the air in this circulation is

$$H = \frac{200{,}000 \times 3 \times 5.2}{33{,}000} = 94.5 \textit{ hp.}$$

Assuming the general efficiency of the fan and engine as 70 per cent., according to the question, the horsepower required of the engine to drive this fan is $94.5 \div 0.70 = 135$ hp.

(d) It is impossible to calculate the mechanical efficiency of the fan alone, from the data given. The general efficiency in this question is assumed to be 70 per cent.

[The above question is a difficult one in examination, and the ability to answer such a question correctly does not prove the capability of the candidate to act as mine inspector. Further, the solution given above, which is the only one that can be applied to answer the question. involves a wrong principle in fan ventilation. Practically, there is no such thing as "volumetric ratio," as the volume of a fan, in cubic feet per minute, bears no fixed relation to its yield.

It is important to notice, also, that the water gage due to the peripheral speed of a fan is only realized when the mine potential is such as to develop that gage, allowing for the efficiency of the fan, which varies with the speed, but not in the same proportion.

As a matter of fact, a fan that will pass 200,000 cu.ft. of air per min. against a water gage of 3 in., at a speed of 134.5 r.p.m., would require to be 16.5 in. in diameter and 6 ft. 5 in. wide. The diameter of the double intake of this fan should be 10 ft. 3 in.—EDITOR.]

Coal and Coke News

Harrisburg, Penn.

At the hearing on May 11, before the Senate committee on corporations, J. H. Torrey, representing anthracite interests, asked that the workmen's compensation bills be so amended that the earning capacity of the miner would be based on the amount actually received by him after deductions for oil, squibs, powder, blacksmith work, etc., have been made.

He also asked the committee to restore to the bill provisions that would permit the coal companies to offer common law defenses in all actions for damages instituted by employees who elect not to accept the provisions of the proposed act. There is little chance of this change being made, in fact there is small prospect of the measure being changed to any great extent.

Various other amendments were offered by bituminous interests and manufacturers, such as limiting the total liability to $4000 on all claims, whether for total or partial disability; eliminating non resident foreigners from benefits; limiting the number of weeks under which employees could secure compensation to 400 instead of 500. It was also suggested that employees pay 10 per cent. of the insurance funds.

A striking phase of the compensation situation is, that the acts will not become effective until July 1, 1916, or only six months before the General Assembly of 1917 convenes. As originally drafted the bills were to go into effect Jan. 1, 1916, or 12 months before the convening of the Legislature. Somewhere along the line this very significant and important change was made in the bills. This feature, just discovered, may or it may not turn out to be a veritable snake.

With the new law in operation only 6 months before the Legislature meets, then with proposed amendments to the constitution approved by the people this fall, that Legislature can make the compensation act compulsory. Under the Constitution at present the bills cannot be made compulsory, only elective.

Another point is that the interim between July 1, 1916, and the convening of the Legislature of 1917, may be wholly consumed in litigation over the constitutionality of the bills about to be passed. In that event workmen's compensation may not become finally effective, irrespective of the action of this Legislature, until the Legislature of 1917 shall have passed new bills, in accordance with the terms of the Constitution as it is about to be amended. And these new bills may not be made effective until some time after the Legislature of 1917 shall have adjourned.

A Conference Committee Has Been Appointed

The Senate refused to concur in the amendment made by the House in Section 8 of the Catlin Bill No. 160, and the House and Senate have named a conference committee to consider the amendments. The committee comprises Senators, Beidleman, Catlin and Crow, and Representatives Powell, Schaeffer and Ramsey.

As this committee is composed of the men who have made the battle for the miners it is presumed by some that the latest move is engineered to put back into the measure some of the things that had been eliminated in the Senate Committee. It is likely that an agreement will be reached to make the bill effective next January, although it was agreed to have the bill become effective when the compensation bills went into operation, although the bill reads that it shall take effect immediately.

The victory of the miners in putting this bill which is of vital importance through both branches of the Legislature is the most complete achieved by the miners of the anthracite region in many years.

The bill as passed not only brings the men under the compensation act, but also defines the word "miner".

The bill as passed by both houses now reads:

> Be it enacted that the act of 1901, etc. . . . . . Section 1. It shall not be lawful, neither shall it be permitted for any person to act as mine foreman or assistant mine foreman of any coal mine or colliery unless he is registered as a holder of a certificate of qualification or service under this act, or unless in the judgment of the employer he is a person possessed of qualifications which make him equally competent to act in such position.
>
> Section 6—No mine shall be operated for a longer period than 30 days without the supervision of a mine foreman. In case any mine is worked a longer period than 30 days without a mine foreman the owner, operator or superintendent thereof shall be subjected to a penalty of $20 per day for each day over the said 30 days during which the mine shall be operated.
>
> Rule 1, The owner, operator and superintendent of a mine or colliery shall use every precaution to insure the safety of the workmen in all cases, whether provided for in this act or not and shall have supervision, direction and control of the mine foreman and all other employees.
>
> Due notice of an intended inquest to be held by the coroner shall be given by the coroner to the inspector, and at any such inquest the mine inspector and any representative shall have the right to examine witnesses and read the law governing the case to the coroner's jury.
>
> The mine foreman, assistant mine foreman, fire-boss and any person placed in charge of the works or any part thereof shall be the agent of the owners and operators and such owners and operators shall employ them and discharge them at will.
>
> Article 18. . . . . The term "miner" means the person who cuts or blasts coal or rock at the face of a gangway, airway, breast, pillar or other working-place, also any person engaged at general work in a mine and qualified to do the work of a miner.

The bill introduced by Senator Crow, amending Rule 18, of the Bituminous Mine Code of 1911, and over which there has been considerable litigation, was signed on May 14, by the Governor. Rule No. 18 now reads:

> In the cutting of clay veins, spars or faults in entries or other narrow workings going into the solid coal in mines wherein explosive gas is generated in dangerous quantities, a bore hole shall be kept not less than 3 ft. in advance of the face of the work or 3 ft. in advance of any shot hole drilled for a blast to be fired in.

A bill to regulate the use of safety lamps in certain bituminous coal mines and providing a penalty has been introduced by Senator Stewart and was referred to the Committee on Mines and Mining. The bill reads:

> That on and after Apr. 1, 1916, it is unlawful to use in any bituminous coal mine generating explosive gases, and employing 10 men or more, any lamp other than a portable electric lamp of the style or type tested by the Federal Bureau of Mines and approved by the Pennsylvania Department of Mines.
>
> An ordinary gas testing lamp known as a safety lamp may be used when approved by the Chief of the Department of Mines, only for the purposes of examining working places and for testing the gaseous conditions of air currents in the mine.
>
> Each mine owner shall provide the employee in the mine with a portable electric lamp at or near the entrance of the mine when the workman reports for duty. Such portable electric lamp shall be in good operating condition and no repairs shall be made to a lamp, nor any adjustment made while the lamp is in the mine.

The bill carries a penalty of $25 for the first offense and $100 for the second offense.

A bill similar to this was introduced during the early part of the session, but the committee on Mines and Mining in the House reported to the Speaker with a negative recommendation, which killed it.

PENNSYLVANIA

Anthracite

Pittston—Two men were killed at the Barnum mine of the Erie Co. recently by a fall of rock, while two others were injured at the same time. The men were robbing pillars in the Checker Vein and the removal of the coal let down the roof.

Wilkes-Barre—The introduction of a new system of checking mine workers at Stanton and Empire collieries of the Lehigh and Wilkes-Barre Coal Co., as they enter and leave the mines, under which severe penalty is imposed should the mine workers lose their small brass checks, has resulted in a strike of about 1000 employees at these collieries. Final settlement of the grievance is being awaited with interest by mine workers of the Wyoming Valley as the dispute is a novel one and it is believed by many of the men that officials of other coal companies intend placing the brass check system in operation. The men allege it is an easy matter to lose a brass check, an occurrence which they claim in most cases is beyond a man's control. It is planned to take the case before the Conciliation Board.

Mauch Chunk—The strike of the Lehigh Canal boatmen employed by the Lehigh Coal and Navigation Co. is at an end and the men have gone back to work without receiving the increase of 10 cents per ton, which they demanded. Many of the men and their families lived in the boats, and as the company was about to sink the boats to prevent them from drying out, the men decided to go to work.

Shenandoah—The cylinder head of a 100-hp. hoisting engine blew out at the Lawrence Colliery, operated by the Maderia Hill Coal Co. recently. Three cars were pulled over the slope head, demolishing the structure and part of the engine house and all the electric wires, supplying power and light to Frackville, Girardville and Gilberton.

Carbondale—Eighteen hundred mine workers went on strike May 15, at the Coalbrook colliery of the Delaware & Hudson Co., because of a disagreement over a scale. The mine workers charge that the scales are in bad condition and that they have been losing credit for about 2000 tons of coal a day as the result. Operations at the Wilson Creek colliery are also halted as the coal from that mine is prepared for market at the Coalbrook breaker.

Bituminous

Uniontown—With all 400 ovens of W. J. Rainey's Allison plant in blast, 200 new ovens partly completed and an additional 200 just started, the indications for a return of good times with the Rainey interests at least are certainly the best. All the old ovens at the Allison plants are running full blast and have been for several days. The system at this plant is to add ovens as the mine develops and as a result additional ovens will be needed in the near future. Ninety-three of the new ovens are well under way and will be completed in August when it is expected that they will be fired immediately. One hundred and seven more are in process of construction and will be completed during the early part of 1916 while the 200 just started will be completed later in that year. The work of building these ovens is being done by the company under the supervision of J. H. Dunn, chief engineer at Allison. Eighty-two per cent. of the Rainey company's ovens throughout the region are now in operation and it is quite probable that this percentage will be increased within the next few weeks.

It is predicted that every available coke oven in Fayette County will be in full blast and that the coke plants will be working six days per week within a short time. The Pennsylvania R.R. is making arrangements to handle the heaviest traffic in years, and it is believed that barring war between Germany and the United States the coke region will see the greatest prosperity in its history.

Roscoe—Orders were recently issued closing down the Eclipse mine of the Pittsburgh Coal Co. indefinitely. The reason given is the low stage of water in the Ohio River, which prevents shipments. This is rather unusual for this time of the year. It is rumored that the Alice mine of the same company, located across the river from the first, may be closed down within a few days.

WEST VIRGINIA

Huntington—Permanent annual contests between expert mine rescue teams throughout this state and possibly includig eastern Kentucky and parts of Ohio are planned for Huntington in connection with the annual fall festival. It is expected to conduct local elimination contests at mining centers throughout West Virginia, winners of which will come to Huntington every fall to compete for state honors and prizes. A day to be known as Mines and Mining Day will be set aside during the fall festival of each year, on which the contests will take place.

Bluefield—Coal shipments on the Norfolk & Western R.R. went over the two million ton mark in April for the first time since September of last year. These shipments put the business of the field back to normal, or almost normal, and it is expected that the output will continue to grow.

Moundsville—A force of men has been put at work by the Mound City Coal Co. making an excavation for an enlargement of the hoisting shaft at the Mound mine. This enlargement is made necessary in order that the company may increase the output of the mine. Some extensive repairs will also be made to cages and outside of the shaft. These improvements are only part of those contemplated in the future.

Charleston—Coal operators in West Virginia are handicapped as a result of a scarcity of miners, and it is believed that the eastern Ohio operators will have difficulty in manning their mines. Many mine workers are also wanted in eastern Kentucky, and field agents have been at work for some weeks trying to get men.

Grafton—The Maryland Coal Co. expects shortly to increase its operation to full capacity at the Wendel plant. About 800 men will be employed, and the output will be between 3000 and 4000 tons per day.

ALABAMA

Birmingham—Thousands of people participated in the celebration of the formal opening of Lock 17 on the Warrior River, recently. The opening of this lock gives the coal belt of the South an outlet to the sea. At a cost of $12,000,000 the river has been made navigable all the year around from Cordova to the Gulf. In the coal fields on the Warrior River, within three miles, it is estimated that there are 770,000,000 tons of workable coal available for barging down the river. Practically all of the coal of Jefferson, Tuscaloosa and Walker counties, which is about three-fourths of the total production of Alabama, may be shipped if desired by the Warrior River. Present freight rates on coal from Birmingham to New Orleans when coal is not for export use, is $1.10 per ton. It is estimated that the cost of barging coal down the Warrior from the mines will not exceed 50c. per ton. The Warrior is now the longest canalized river in the United States if not in the world. Lock 17 was built at the cost of $3,750,000. The dam raised the bed of the river 63 ft. and backs water of a minimum depth of 6 ft. at any period of the year as far north as Cordova. The work of construction was begun in December, 1911. The completion of this lock marks one of the greatest epochs in the industrial history of the state, and means more for the development of the vast resources of coal in the state than any other achievement in the history of Alabama.

KENTUCKY

Lothair—The Kentucky Jewel Coal Co. is now operating its mines full time—every day in the week. Orders from the Great Lakes region will keep them operating full time the remainder of the year. These mines are now shipping about 2000 tons daily; this is to be increased June 15.

Whitesburg—The Elkhorn Mining Corporation is preparing to resume its operations at Haymond on the Potters Fork branch of the Lexington & Eastern, after an idle period of six months or more. Much improvement is noted in the mining operations in this section.

Louisville—Kentucky operators having mines on the Louisville & Nashville R.R. as well as mines located suitably for water shipment, have been much interested in the statements in the papers to the effect that Spain wants coal and is preparing to guarantee payment for purchases made in this country. The mines on the L. & N., it is believed, can ship via Tampa and quote prices f.o.b. that port which will be attractive to the foreign consumers. At least operators are looking into the proposition, feeling that whether it proves practicable or not, the trade that may develop with Europe will divert other American coals from competitive markets.

OHIO

Martins Ferry—The Connor No. 2 mine of the Wheeling & Lake Erie Coal Co. at Connorsville is the first mine in the Belmont district to load coal following the 14-month strike. This mine employed 350 men when shut down, and only 50 men are now at work, but as soon as the mine can be gotten in condition, the full force will be employed.

Alexander Chimbrook sued the Youghiogheny & Ohio Coal Co. for $25,000 for injuries sustained in the mine. Before the suit was begun in Common Pleas Court, however, he agreed to accept $700 for the injuries sustained.

Athens—The Sunday Creek Coal Co., through J. H. Winder, general manager, has announced that it has purchased platform scales for all of its mines not heretofore equipped with them, in order to enable the weighing of coal at the bottom of the shafts as a temporary means of determining the run-of-mine weight of coal.

New Lexington—The announcement is made by the Peabody Coal Co. that it has abandoned operations at the Jobe mine, near New Lexington, Ohio. The equipment is being shipped to Illinois where the company is developing a large coal tract. When the mine is abandoned the switches will be removed. Fully 100 men have been thrown out of employment by the move.

Big Run—The Rail & River Mine No. 3 was recently inspected and found to be in first-class condition with the exception of a few minor falls and some repair work to be done in the bottom all of which may be completed within 10 days. It is believed that when this mine goes into operation again it will probably be the largest in the state. When in operation at full capacity it will employ about 500 loaders and 150 day men, and will have a daily output of 2500 to 3000 tons. It is believed that the company will later open a new shaft below Pipe Creek.

ILLINOIS

Coffeen—The Clover Leaf coal mine has closed down and will remain idle for possibly a month. It is said there is no market for lump coal, but slack can be sold in considerable quantities. This mine has been running better than almost any other operation in this section of the state.

Belleville—Twenty-six coal mines located on the Illinois Central R.R. expect to sell their coal in St. Louis through a central selling agency. It is said that operators along other lines are organizing on the same general plan in order to stop ruinous competition. This will not materially change prices.

FOREIGN NEWS

Nanaimo, B. C.—Classes in first aid have been held during recent months at nearly all the coal-mining centers in British Columbia. While this is by no means a new departure in some parts of the province the movement has been more general lately than in other years. Doubtless this is in large measure due to the persistent interest taken in mine rescue training and first-aid instruction by the chief inspector of mines for the province, Thomas Graham, and the members of his staff. While not nearly all those who attend the classes for instruction afterwards present themselves for examination, a fair percentage of them do. During recent weeks examinations were held and passes made, as follows: Vancouver Island, at Ladysmith, 20 passed; Nicola Valley, at Merritt, 17; Crowsnest Pass, at Michel, 22. Other classes on Vancouver Island, and at Coal Creek and Fernie in the Crowsnest Pass district are yet to be examined. An effort will be made to send a first-aid team from Crowsnest district to participate in the first-aid competition at the Panama Pacific International Exposition at San Francisco, next September.

PERSONALS

C. L. Scroggs, for many years commissioner of the Illinois Coal Operators Association, has been placed in charge of the Coal Mining Department of the Rockwood-Badgerow Co., general agents for the Travelers and the Aetna Accident & Liability Insurance Co.

James W. Eaton, mine foreman of Hecla No. 2 mine, Trauger, Penn., has been teaching mining school for the past 8 years, having 65 successful candidates for certificates as mine foreman and fireboss. Mr. Eaton's class of 1915 consisted of 10 students, of whom 8 were successful candidates.

A. H. Wood, of Petros, Tenn., president of the Petros Coal Mining Co., spent a few days recently in the Harlan, Ky., field on business connected with a new company he is organizing to develop a coal lease there. He was accompanied by parties who expect to become interested with him in the proposition.

Francis Glover, mining engineer of the Princeton Coal & Land Co., Princeton, B. C., has been appointed agent for the claim holders of the Roany placer claims situated between Princeton and Coalmont, B. C. The Lost Creek Mining Co. is operating this property. Chester Lee, mining engineer of Seattle, is engineer for this firm.

Patrick Hennessey, formerly superintendent of the Libby mine, has leased the C. A. Smith coal mine at Henryville, near Marshfield, Coos Bay, Ore., and 25 miners are now employed. Hennessey will market the coal in Marshfield and at Myrtle Point and in addition has a contract to supply the Smith-Powers logging locomotives operating in that district.

OBITUARY

Thomas Sweeney, 59 years old, a mine superintendent at the William Penn Colliery and a noted temperance advocate and member of many church and fraternal societies, died at Shenandoah, Penn., May 15.

H. J. McDermott, for many years chief shipping clerk of the Philadelphia & Reading Coal & Iron Co., died recently at his home in Philadelphia. His geniality and long familiarity with the anthracite business won him a host of friends, particularly throughout New England.

John Birkinbine, a noted mining and mechanical engineer, died recently at his home in Philadelphia at the age of 71 years. Mr. Birkinbine was consulted in many engneering problems throughout this country. He developed schemes for utilizing the water power at Niagara Falls, and devised the use of blast furnaces in the Lake Superior copper region. He was former president of the American Institute of Mining Engineers, and was for many years chairman of the Pennsylvania Water Supply Commission.

INDUSTRIAL NEWS

Portsmouth, Ohio—Ground has been broken for the first section of the new line to be built between Portsmouth and Columbus by the Chesapeake & Ohio R.R. Co.

Charleston, W. Va.—The Kanawha Mine Car Co., Charleston, W. Va., has changed its name to the Kanawha Mfg. Co. There will be no change in the policy or administration of the firm.

Birmingham, Ala.—It is stated that the American Steel & Wire Co. has a sufficient amount of orders on its books to provide for operations during the entire summer, and that probably operations will be increased.

Columbus, Ohio—Upon the application of Charles Cohenour, the receiver for the Maple-Gallia Coal Co., the receivership has been closed by Judge Rogers. The property in Athens and Vinton counties has been sold to a new concern.

Harrisburg, Penn.—Joint resolutions calling for an investigation by a State Commission of increases in prices of coal alleged to be in excess of the anthracite tax, were recently adopted in the House by a vote of 171 to 5. They have now gone to the Governor.

Greensburg, Penn.—Suit has been entered by the Girard Trust Co. of Philadelphia against the Bolivar Coal & Coke Co., to collect on a mortgage of $60,000 with interest from May 6, 1913. It is declared the company has mined coal but failed to pay the interest on the loan.

Wheeling, W. Va.—A number of mines will resume operations in the eastern Ohio field shortly. Among these will be the Roby-Somers, Purseglove and Gaylord mines, as well as many others. The majority of the operations will not be started, however, until on or about June 1.

Pittsburgh, Penn.—Work was recently begun on the United States Bureau of Mines building to be erected at Forbes and Boundary St. The building will be a three-story concrete structure and will be the first of its kind in the country. It is expected the work will be completed by June 1.

Bluefield, W. Va.—H. M. Waugh, of Orange, Va., has been awarded the contract for the construction of main line and side tracks to Leckie mine from the Williamson & Pond Creek Ry. The excavation is estimated to be 100,000 cu.yd. of steam shovel work. It is understood that this work will be begun at once.

Fayetteville, W. Va.—The coal loading for April in the Guyan district totaled 461,020 tons, a decrease of 22,675 tons for the month of March, and 34,530 tons less than the loadings for April of 1914. For the first four months of the current calendar year, however, 1,915,415 tons have been loaded as compared with 1,752,860 tons loaded within a similar period of last year, or an increase of 162,555 tons.

Bluefield, W. Va.—There was recently recorded in the county clerk's office a deed from the Burkes Garden Coal & Coke Co., to the United Pocahontas Coal Co., on which were placed $170.50 in war revenue stamps. This is one of the largest collection of stamps to be sent out from the county clerk's office since the war revenue was put in force, and seems to be a considerable sum to be paid when we are not at war with any country.

Coalwood, W. Va.—Geo. L. Carter, president of the Carter Coal Co., Coalwood, W. Va., recently awarded a contract to the Roberts & Schaefer Co., Chicago, for the complete designing and building of a large steel "Marcus" patent coal tipple, complete with screening and picking facilities and three "R and S" shaking loading booms, for installation at the large shaft mine recently sunk on the property of this company at Coalwood, W. Va. About $60,000 was involved in this contract.

Huntington, W. Va.—It appeared to be the consensus of opinion among about 20 operators from southwest West Virginia, assembled at the mine rescue and first-aid contest, that business conditions were showing remarkable evidences of resumption to normal conditions. Mines are opening up throughout the southern part of the state, and the operators agree that there are indications of a steady increase in the volume of tonnage and the amount of business in the coal regions of the state.

Mabscott, W. Va.—Through the medium of the Raleigh County Business Men's Association, the Carper Foundry & Machine Shop may soon be transformed into a manufacturing plant employing from 100 to 125 men. While this shop with its present capacity has never been anything but a repair shop, it is now planned to enlarge it for the manufacture of mine cars, fans, haulage equipment and all kinds of mine machinery for which there is considerable demand throughout the immediate vicinity.

Morgantown, W. Va.—The Roberts & Schaefer Co., Chicago, recently secured a contract from the Elkins Coal & Coke Co., Morgantown, W. Va. (J. B. Hanford, general superintendent), for the designing and building of a "Marcus" patent coal tipple with screening and picking facilities, and equipped with "R and S" patent shaking loading booms, for installation at Bretz, W. Va. This plant will be electrically operated throughout, and is the second structure installed by the Elkins company using horizontal screens.

Washington, D. C.—Notice was recently given by the Interstate Commerce Commission that it would begin upon its own motion an investigation into the rate, divisions, rules, regulations and practices governing the transportation of railroad fuel and other coal by rail originating on the Carolina, Clinchfield & Ohio Ry. in Virginia. The object of this investigation is for the purpose of issuing an order demanding that the roads, cease making rates, divisions and rules favoring coal and other fuel transported for carriers.

Birmingham, Ala.—The contract for the fourth unit of the coal washers of the Woodward Iron Co., was recently awarded through the General Machinery Co., to the Link Belt Co. of Chicago. The price for the fourth section is said to have been $30,000. It is said that when this fourth unit is added to the Woodward plant that the facilities there will be among the best and most capable in the United States. The washer will be of concrete and steel and the plant is expected to be ready for operation within the present year.

Uniontown, Penn.—Two hundred and fifty ovens were fired May 13 by the Consolidated Connellsville Coke Co., at Mt. Sterling and Grays Landing. This gave employment to about 300 men. The order for resumption followed the blowing in of a furnace in the Ohio Valley. The Consolidated Connellsville company has received an order from this furnace for 12,000 tons of coke per month for the remainder of the present year. The entire plant of 310 ovens at Mt. Sterling will be in operation and there will be 220 ovens at Grays Landing in blast. Both plants will be operated six days a week.

Uniontown, Penn.—Following all sorts of prosperity predictions emanating from various sources during the past few months, a published statement from F. P. Truesdale, division freight agent for the Pennsylvania R.R., states that tabulated statistics received at his office indicate that of all the steel mills in the United States 95 per cent. are in full blast with every reason to believe that within a short time operations will increase to 100 per cent. This statement, if true, means much to coal and coke operators and employees as the operation of these steel mills on such a scale means many increased orders for coke together with better prices.

New York, N. Y.—As a result of the absorption of the William A. Jepson Coal Co., of Boston, by the Skeele Coal Co., of New York, William A. Jepson will represent the latter company in the Eastern territory with the title of General New England Manager. He will have his headquarters at No. 85 Devonshire St., Boston. Mr. Jepson has been identified with the coal trade in and around Boston for upwards of 30 years and will no doubt make the New York company a big factor in the New England market. E. J. Skeele, president of the Skeele Coal Co., is the son of J. W. Skeele, for many years identified with the Lehigh Valley Coal Co. and later, until his death, president of the Lehigh Valley Coal Sales Co.

Coal Trade Reviews

General Review

Heavy curtailment by the anthracite companies. Effects of the increased export bituminous business felt in all sections but trade continues dull. Lake shipping increasing but still light.

A drastic curtailment program on the part of the leading hard coalers, the Lehigh Valley Coal Co. having suspended operations for an indefinite period, is the feature of the anthracite situation. The smaller dealers are apparently stocked up to the full limit of their storage capacity and the wholesale business will continue quiet until the consumers begin taking coal. While the combine is maintaining the regular company circular as rigidly as ever, the individuals are attempting to force business with heavy cuts, but with only indifferent success. The slowing up is characteristic of this season of the year, but it has attained to proportions entirely too large for comfort.

That the closest attention is being focused on the off shore export trade in all parts of the country is evidenced by the fact that reports from the Pittsburgh district are to the effect that foreign shipments are being made from that section in spite of its geographical handicap, while Chicago is getting scarcely any of the Pocahontas and New River grades, owing to the heavy demand at Seaboard. The rapid increase in this business is further indicated by the recent announcement of the leading ship brokerage firm to the effect that they are negotiating twice as many coal charters as in normal times. There is no doubt that the British embargo against coal exports from that country is proving a tremendous stimulant to our foreign trade.

Although Eastern bituminous prices are now steadier than for several months, internal consumption continues light and the current market discouragingly dull. There are still a good many large contracts to be closed but the heavy export demand is causing buyers to show more interest.

While Lake shipping from the Pittsburgh district is increasing steadily, the volume moving is still relatively small, and confined entirely to permanent consumers such as railroads; other consumers are still apparently drawing on their surplus stocks. While the regular circular on Lake coal is nominally maintained, it is understood in reliable quarters that substantial concessions can be obtained on large tonnages. The final arranging of the Ohio labor difficulties will no doubt see a heavy increase in the tonnage but the market stituation continues quiet with prices maintained only with the greatest difficulty. Buyers are apparently convinced that they will be able to obtain cheap coal in the prompt market for some time to come, and few contracts are being closed.

Conservative interests in the Middle West regard the situation there as even worse, although there are many who believe that the present stagnation presages an active business after mid-summer. The heavy overstocks of Lake coal are exerting a particularly depressing effect on the market, but on the other hand the industrial situation is showing slightly more activity and a great deal is being anticipated from the various coöperative movements on foot to maintain prices.

BUSINESS OPINIONS

Business hesitating, pending diplomatic developments. Rumors of crop losses discounted. Iron trade apparently slowing down.

Financial Chronicle—Obviously, the occasion is not opportune for the rearing of bubbles of any kind, at a moment when the whole world appears to be becoming topsy-turvy, and no one can tell what startling thing is going to happen next and what far-reaching consequences it may involve. It is only proper to say, however, that ordinary financial and mercantile affairs are receiving very little attention for the time being, and scarcely any one cares a fig about what is happening on the Stock Exchange.

Modern Miller—Eight counties in southern Kansas report Hessian flies in considerable numbers, while their presence is not confined to these counties. Elsewhere they appear scattered, thus localizing their effect. It is impossible to measure the extent of damage which will not be fully apparent before June 1. Because of the big forecast of the Government, May 1, the scattered damage so far reported since then is minimized.

Boston News Bureau—At the moment, people are merely awaiting the outcome of the pending diplomatic negotiations. There is anxiety, but no fear. Money continues abundant and is still accumulating. We are increasing our foreign credits steadily. There have been some efforts to advance wheat prices by reports as to damage to the winter wheat by the Hessian fly. But the same reports were circulated at this time a year ago and yet we harvested a bumper crop.

Dry Goods Economist—The new international complications have had surprisingly little effect on the markets for dry goods and allied lines. In some quarters there are decided evidences of optimism.

Dun's—The developments of the week afford new proof of the essential stability and power of the financial and business structure. While there is uncertainty as to the final outcome, there is faith in the ability of the nation to adapt itself with financial readiness to every contingency that may arise. Outside of the stock, cotton, and other equally sensitive markets, the effect of the new war developments has not materially changed the generally favorable aspect of the trade situation.

Bradstreet's—Possible international political complications affect sentiment and prices in speculative markets, particularly securities, grain, and cotton, and perhaps throw shadows over optimistic expectations of a boom in trade, but thus far foreign developments have failed of especial untoward effect upon domestic trade or industry.

Iron and Steel—The feature of interest in the iron trade was the order placed by the Pennsylvania R.R. for 25 locomotives and the later announcement that contracts had actually been closed for 6400 cars. This interest is likewise figuring on about 30,000 tons of rails in addition to its order for 160,000 tons which will go to Eastern mills. In general, the iron trade has been dull and far less active than in several weeks. This extends through all branches of trade, and has been noted more especially in the pig iron market. A falling off in the demand for munitions of war is likewise observed, but this is of little consequence for the moment, for the orders placed within the last month have been of such magnitude that they taxed the capacity of the shops of the country.

ATLANTIC SEABOARD

BOSTON

Firmer tone in Pocahontas and New River, due to increased trade off-shore. Some small contracts closed recently, but still quite a tonnage to be covered. No change in Georges Creek or Pennsylvania grades. Water freights easy, with sail tonnage chartering off-shore. Anthracite shipments continue in fair volume.

Bituminous—Prices on the Hampton Roads coals are rather steadier than for several months. A better tone is observed, especially on f.o.b. business, and there is now practically no fear that prices will recede to any material extent so long as there continues a demand for export. The trade off-shore is in good shape. The volume of coal dumped at the piers is increasing and compared with a month ago there is much more inquiry. Coastwise, there is improvement in the contract demand but no spot business of any consequence has yet developed. At the same time, the agencies are encouraged over general prospects.

Only a few contracts have been closed the past week, and these practically all with private corporations. There is still some locomotive fuel to be bought, and at least one of the street railway systems is still holding aloof from the market. Some of the consumers who ordinarily take Georges Creek have been interested in getting covered in view of the volume of export business which the shippers of that grade have undertaken. The Pocahontas and New River shippers are still actively canvassing and it may be that some of those who have stayed out of the market in the expectation of lower prices will be induced to close before many weeks. Prices at distributing points like Providence and Boston are somewhat higher.

Very little Georges Creek is available at any point other than Baltimore where there are still a number of foreign bottoms awaiting cargo. There is no change in the Pennsylvania grades. Prices are still at a minimum and so far as this market is concerned there is very little doing on coal of this character at Tidewater.

Water Freights remain easy at 70 to 75c., Hampton Roads to Boston, inquiry still being light. Sailing vessels continue chartering off-shore. Rates on anthracite barges from Philadelphia are 80c. to Boston points.

Anthracite—Domestic sizes are coming forward in fair volume. There were spells of adverse weather in April and that has carried the heavy shipping season farther into May than was anticipated. Most of the smaller dealers have now taken on liberal supplies and not much wholesale business is looked for until coal begins to move to the consumer. Meanwhile, some of the smaller New York shippers are striving hard to move their receipts at the loading ports.

Current quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.85@1.40	$1.20@1.60	$1.67@1.77	
Philadelphia*	2.10@2.65	2.45@2.85	2.92@3.02	
New York*	2.40@2.95	2.75@3.15	3.22@3.32	
Baltimore*	....	....	2.85@2.95	
Hampton Roads*	....	....	....	$2.75@2.80
Boston†	....	....	....	3.55@3.78
Providence†	....	....	....	3.50@3.73

* F.o.b. †On cars.

NEW YORK

Slightly better tone to bituminous though conditions are still dull. Mines generally on half schedules except those in the export trade. Drastic curtailment in anthracite operations. Market heavy in all directions.

Bituminous—The bituminous coal market continues weak in many respects although there has been a slight improvement in the general tone. Operators have been curtailing production which has prevented over-stocking of the docks. This has prevented a slump in prices which would surely have come had the market been flooded. On the other hand there is plenty of coal on hand to meet all immediate demands.

The export situation continues to improve and inquiries are increasing. Although the order of the English government prohibiting the export of coal has been in force but a little more than a week, local exporters say the situation has improved considerably. One inquiry received this week was for 50,000 tons of high volatile coal. Exporters look for an increase in shipments to South American ports as well as to European countries. Bona fide inquiries have been received from Italy and France.

At the local harbor there has been a slight increase in demurrage coal nearly all in the cheaper grades. Shippers are having very little trouble with the better grades and little of these coals has been offered in spot sales. Line trade is fair. Some of the poorer grades were offered at $2.15.

Quotations on the various grades are as follows:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek	$3.00@3.10	$3.00@3.10	$3.00@3.10	$1.45@1.55
Clearfield:				
Medium	2.65@2.80	2.50@2.65	....	1.10@1.25

Steam		2.60@2.70	2.60@2.70	.80@ .90
Western Maryland		2.25@2.40	2.25@2.40	.80@ .90

Anthracite—The effects of the mild winter and the light demand for anthracite coal this spring have already become apparent and the companies are now curtailing production. What may be the first steps in this direction were taken last week by the Lehigh Valley Coal Co. when operations were suspended at its collieries for two days and a drastic curtailment program was started this week. It is expected that other companies will take similar action shortly.

Demand has fallen off considerably the past week and the shippers find themselves well supplied with all sizes. To save the situation it is necessary to cut down production and this it is believed will be done.

Nut coal is longest of the prepared sizes with stove and egg close seconds. Pea is much in evidence with few takers except on standing orders. The small steam sizes appear in greater abundance. The suspension of mining, however, will put these coals in a strong position. Some grades of pea coal have been disposed of as low as $3 during the week, while a few buyers have been able to pick up bargains in demurrage steam coals at lower figures than have prevailed in the hard coal market for some time.

Current quotations on anthracite are as follows:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$4.65		$4.70	
Egg	4.90	$4.80	4.95	$4.85
Stove	4.90	4.80	4.95	4.85
Chestnut	5.15	5.00	5.20	5.05
Pea	3.35@3.50	3.10@3.35	3.40@3.55	3.15@3.40
Buckwheat	2.50@2.75	2.25@2.50	2.55@2.80	2.30@2.55
Rice	2.00@2.25	1.90@2.10	2.05@2.30	2.00@2.25
Barley	1.75@2.00	1.60@1.75	1.80@2.05	1.85@2.10

BALTIMORE

Bituminous slightly stronger and prices stiffer. Export tonnage continues large.

A slow but sure betterment is noted here in the bituminous trade. The prices for Pennsylvania coals are moving upward; ordinary grades that some weeks ago could be bought at around 85 to 90c. are not offering at present below $1, and are growing scarcer at that figure. So-called best Pennsylvania coals sell around $1.25 to $1.30, while certain specialized fuels command as high as $1.40 to $1.45.

West Virginia and Maryland coals hold their own, but show no special advance for the most part. Lower grade Maryland coals are offered around 80c. at the mines and Fairmont mine-run sells at 80 to 85c. Three-quarter gas at 90 to 95c. is steady.

Export movement continues strong. Last week approximately 48,000 tons was loaded for foreign ports from Curtis Bay and Port Covington piers. The May tonnage is expected to run considerably above 200,000 tons. The foreign vessels carrying coal also absorbed 16,000 tons for bunker supply the past week.

The charters for the past week included the following:

Vessel	Nationality	To	Rate	Vessel	Nationality	To	Rate
Luigi Ciampi	Italian	Italy		St. Winifred	British	Plate	
Harmattia	British	Italy		Cronchie	British	Italy	$10.80
Chiverstone	British	Montevideo	$9.60	Francisco	Italian	Italy	9.60
				Megree	Dutch	Plate	9.36
Semantha	British	Italy	9.60	Strathbeg	British	Sicily	9.60
Kerriemoor	British	Plate	9.60	Antigone	British	Plate	9.12
Holtye	British	Italy	9.60				
Anto. Accame	Italian	Italy					

OCEAN FREIGHTS

Coal charters twice as heavy as in normal times. Spanish shipments show a particularly rapid increase.

This country's export coal trade is growing daily, and instead of our chartering one or two steamers per day, as in the past, we are now chartering two or three steamers daily for this trade.

Mediterranean—Rates to West Coast of Italy are unchanged. and remain firm owing to the increased demand for steamers to take coal from this country to Spanish ports. Rates to Spanish ports are about $9.96 to $10.20, with 500 to 700 tons a day for discharging, consignees paying Spanish dues on cargo. (We believe that the Spanish dues were recently abolished by the Spanish Government.) These Spanish shipments are increasing materially owing to the recent English embargo. To Marseilles rates are about $10.20 for single trips, or $9.60 for a number of trips.

South America—To the Plate and Brazil we continue to charter almost daily at about 36c. per ton less than boats are being closed in London for similar voyages.

Cuba and West Indies—These rates are a trifle firmer.

The market is now quotable as follows:

To	Rate	To	Rate
Havana	$2.25@2.50	Bermuda	$3.50@3.75
Cardenas or Sagua	3.25@3.50	Vera Cruz	**3.50**
Cienfuegos	3.25@3.50	Tampico	**3.50**
Port au Spain, Trinidad	3.75@4.00	Rio	9.00@9.12
St. Lucia	3.50@3.75	Santos	**9.12**
St. Thomas	**3.25**	Montevideo	**8.40**
Barbados	3.75@4.00	Buenos Aires or La Plata	8.40@8.64
Kingston	3.00@3.25	Rosario	8.64@8.88
Curacao	3.75@4.00	Mediterranean*	**10.80**
Santiago	3.25@3.50	Spain**	**10.08**
Guantanamo	3.25@3.50	Valparaiso†	**6.72**
Demerara	5.50@6.00	Marseilles	**10.20**

Note—Rates noted in **bold face** type are only approximate.
* To a direct port on the West coast of Italy.
† With 800 tons per day discharge.
**Spanish dues for account.
W. W. Battie & Co.'s Coal Trade Freight Report.

HAMPTON ROADS

Export movement fair. Government colliers loading during week greatly decrease accumulated cars.

While the export movement has not been as heavy as anticipated it has been fairly good. Shipments for Italian ports have dropped off considerably, only one cargo having cleared between May 8 and 15. The largest amount of coal moving to any one port has gone to Montevideo, the tonnage being approximately 15,000. Shipments to Brazilian ports have amounted to about 18,000 tons. Coastwise shipments have as usual been heaviest to Boston, Providence, and Portland while other New England ports have taken some small cargoes.

In addition to coal shipments there have been some small quantities of coke moving to Havana in connection with parcel shipments of coal to that port. Various grades of high volatile and nut and slack have been moving coastwise and there is perhaps at this time less accumulation of nut and slack at Tidewater than has been the case for some months.

Vessels loading coal from Hampton Roads port for export during week of May 7 to 14, inclusive:

Norfolk

Vessel	Destination	Tons
Guildhall[2]	Havana	3424
Christoforo Vagliano	Montevideo	3737
Bowden[3]	Port Morant	1200
Sophie H[4]	Montevideo	4180
American Transport	Montevideo	6400
Annie[1]	Pernambuco	888
Sedgwick[1]	Maranhan	758
Windermere	Vera Cruz	3800
Silverton	Rosario	3430
Albert Hall	Rio de Janeiro	6532

Norfolk

Vessel	Destination	Tons
Phineas W. Sprague	St. Michales	963
Henry Lippitt	Maranhao	1205
Warren Adams	Maranhao	835
Tordenskjold	Canal Zone	5500

Newport News

Vessel	Destination	Tons
Merity	Rio de Janeiro	5000
Apsley Hall	Tarante	6200
Sark	Port Castries	5100
Denis	Para	2751
Europe	Havana	3000

Note—Steamers are indicated by **bold face type**, all others being schooners. Shippers—[1] Smokeless Fuel Co. [2] New River Coal Co. [3] Crozer-Pocahontas Coal Co. [4] Castner, Curran & Bullitt.

Railroad Tonnages—Dumpings over the local piers for the past several weeks were as follows:

Railroad	Week Ending May 1	May 8	May 15
Norfolk & Western	....	208,179	151,113
Chesapeake & Ohio	60,967[1]	88,609[2]	80,045
Virginian	65,099	45,116	57,903
		341,904	289,061

[1]Week ending Friday. [2]Nine days.

OCEAN CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Flixton	British	Philadelphia	Buenos Aires	2705	$9.12
Harmattan	British	Baltimore	Italy	3046	
Luigi Ciampa	Italian	Baltimore	Italy	2603

George E. Warren		Philadelphia	Bangor	1616	
Bradford C. French		Newport News	Brazil	920	
General E. S. Greeley		Baltimore	Mayport	1198	

Note—Steamers are indicated by **bold face tupe**, all others being schooners.

COKE

CONNELLSVILLE

Only modest inquiry for furnace coke. Active contracting for foundry coke for six and twelve month periods. Prices and output unchanged.

There are two or three inquiries for furnace coke for shipment over the second-half, but the inquirers are certainly showing no anxiety to close. Prompt furnace coke continues in poor demand. Contracting for foundry coke has increased further and is now at a rather lively rate. One of the large interests making a specialty of high-grade foundry coke is entering contracts freely at $2.40 for the twelvemonth beginning July 1, while another is trying where possible to restrict contracts at this figure to six months and two others are reported as firmly maintaining the position of selling for only six months. There is lower grade foundry coke to be had for any period desired at lower figures. We quote: Prompt furnace, $1.50@1.55; contract, to July 1, $1.60; contract to Jan. 1, $1.75; prompt foundry, $2@2.40; contract, $2.20@2.40, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended May 8 at 299,166 tons, an increase of 6275 tons, and shipments at 290,015 tons, a decrease of 13,362 tons.

Buffalo—The trade is quiet, the late reports of growing activity not being indications of any real stir. There is a little more coke moving, but the increase will have to be considerably more before there will be a better price. Iron works are doing a trifle better, but they do not show much sign of returning to a normal activity right away. Prices remain on the basis of $4.15 for best 72-hr. Connellsville foundry and $3.15 for stock coke.

Chicago—No change can be reported in the coke situation from last week. The demand is nil, although prices are well maintained, probably due to less production of byproduct sizes in the West. Prices are as follows: Byproduct, $4.45@4.65; Connellsville, $4.60@4.75; Wise County, $4.50@4.65; gas coke, $3.75@4; furnace, $4.50@4.65.

LAKE MARKETS

PITTSBURGH

Lake shipments slightly increased, but still small and market otherwise unimproved. Mines operating at 50 to 60% of capacity. Possibilities of car shortage.

Pittsburgh district coal shipments in the Lake trade are increasing steadily, but the total is still relatively small for the second half of May. The shipments going forward are chiefly to steady consumers, like the railroads, the ordinary buyers being still out of the market except in rare instances. Very little coal has been moved except by the regular shippers, purchases for shipment being very light. The usual asking price on Lake coal, ¾-in., is $1.15 but it is understood that on lots of any size this price would be shaded a few cents.

Occasional export shipments are being made from the Pittsburgh district, but only in cases where a particularly high-grade coal is required, as other districts can name much lower prices at Tidewater.

An interesting point in the situation is the fact that although coal shipments are far from heavy, mine operations being at only 50 to 60% of capacity, hopper cars are relatively scarce on the Baltimore & Ohio and one or two other lines. There is no actual shortage, but it is thought that with a slight further increase in demand some actual car shortages would develop.

Prices are about the same as formerly quoted. On contracts to Apr. 1, $1.15 would probably be shaded on mine-run. For free coal it is only occasionally that $1 is shaded for mine-run, the large mines adhering to this as minimum. Slack naturally softens as Lake shipments increase, producing more slack, otherwise prices for free coal are the same as last reported: Slack, 60@70c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1@1.05; ¾-in., $1.10@1.15; 1¼-in., $1.20@1.25, per net ton at mine, Pittsburgh district.

BUFFALO

Bituminous market fails to show any improvement. Operations heavily curtailed. Anthracite also under heavy pressure. Coal started moving from Upper Lake docks.

There are conflicting reports on the Canadian trade. Buffalo salesmen agree that the demand there is much lighter than at home, but Canadians contend that the factories there are running at a good rate. It is going to take a decided increase in tonnage before it is much felt in the trade generally. Most mines are now working only two to three days a week.

Quotations remain on the basis of $2.70 for best Pittsburgh lump, $2.55 for three-quarter, $2.45 for mine-run and $2.25 for slack. Allegheny Valley coal is usually 25c. lower than Pittsburgh for sizes, all slack selling about on a par.

There has been an unusually large number of Pittsburgh coal men in the city during the past week.

Anthracite—It is seldom that the trade has been so dull. Some shippers report that there is some sign of improvement, but from what the others say the chances are that any small change for the better looks large. Dullness is to be expected at this time of the year and nobody is alarmed, but the movement is too small for real comfort. It is not likely to improve right away.

Both the local and the rail-line trade is dull and the independent agent or jobber is about as slack as the regular companies. Cutting the price does not sell coal in any amount, either anthracite or bituminous. The amount of Lake coal loaded for the week foots up 156,000 tons, nearly all of it going to shippers' docks at the large ports.

COLUMBUS

Trade quiet and prices maintained with difficulty. Lake business still slow. Production shows a slight increase.

Trade is light in most departments and efforts are being made to maintain quotations. On the whole the price list is fairly well maintained despite cutting on the part of smaller operators and jobbers. The tone of the market is fairly good and many of the producers as well as wholesalers believe that conditions will improve materially when the stocking season arrives.

Domestic trade is quiet, which is to be expected at this season of the year. Some little buying of the fancy grades is reported although this is not large. Preference is being shown for Pocahontas and West Virginia varieties. Little demand is noted for Hocking at this time. Dealers' stocks are apparently sufficient for the present.

Lake Trade is increasing in volume but not fast. There is still considerable coal on the docks of the Upper Lake ports and consequently some shippers are slow in chartering bottoms. The interior movement from the docks is not rapid. With the opening of the eastern Ohio district a larger Lake trade is anticipated. Chartering of boats is more active since the scale has been signed.

Production in Ohio fields has not increased materially during the past week. In fact some of the districts do not show quite as large output. In the Hocking Valley the production is estimated at about 25% of normal and the same figures are good for Crooksville and Jackson. In the Cambridge field the output has been about 35%, Masillon has produced about 40%, while Pomeroy Bend reported 50%.

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.45	$1.50	.....
Inch and a quarter	1.30	1.35	$1.30
Three-quarter inch	1.25	1.30	1.25
Nut	1.15	1.25	1.15
Mine-run	1.05	1.10	1.05
Nut, pea and slack	.60	.60	.55
Coarse slack	.50	.50	.45

CLEVELAND

Eastern Ohio mines are resuming operations and sales agents are working the Lake trade. The local market remains unchanged except for Youghiogheny slack, which is slightly stronger.

Current receipts of coal have been slightly under a week ago with only 200 cars coming in over Sunday. This is 100 cars short of the average over a period of several weeks. Some high-grade West Virginia mine-run steam coal was sold here at $1.65 Monday and was the bargain of the day. Every day last week there was an offering of some particular coal below the normal market price. Pan Handle slack figured in this business one day.

The sales of Youghiogheny slack Monday at $1.65 to $1.75 were easier than usual. The price was not particularly higher than other fine coals, but the demand seemed to be greater and the average price was better. Coarse coals are unchanged.

No. 8 operators put about 2000 men at work Monday and it is understood the entire field will have close to 10,000 men employed next week. This coal is being sold to Lake shippers mostly. No floating arrangements for the coal have been reported, but the supply of tonnage far exceeds the available coal.

Lake shippers report they are able to buy coal cheaper than in the last two years. Prices are from 5 to 15c. below quotations of last year, which in turn were lower than two years ago. So far Lake shipping has been very light. Full shipping is not expected before Aug. 1. Some shippers are only beginning to route coal to the Lakes and others are just beginning to increase bituminous shipments. Hard coal shipping has been normal so far this season.

Quotations for shipment to jobbers are as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmont	W. Va. No. 8
Lump	$3.10	......	......	......	......
Lump, ¾ in.	......	$2.20@2.25	$2.00	$1.80@1.85	$1.75@1.85
Egg	3.10	......	......	......	......
Mine run	2.65@2.70	2.10	1.85	1.85@1.90	1.75@1.85
Slack	......	1.65	1.60	1.65@1.70	......

CINCINNATI

Gains in the Lake movement have not affected the local market. Buyers still confining their purchases to the open market.

The domestic demand is virtually negligible and the same is true of the steam market. The tendency has naturally been toward lower prices, and in many instances spot coal of all grades has sold at almost unheard-of figures. One of the worst effects of this has been to encourage consumers and retailers to hold off on their contracts, in the hope of getting their requirements at bargain prices. At present there is no relief in sight, save in the long-deferred hope of a general and emphatic improvement in the industrial situation, calling for better consumption.

LOUISVILLE

Unsettlement in industrial conditions has caused a slowing down. Some tendency to cut prices.

With industrial conditions so unsettled, the Kentucky coal trade is at a low ebb, purchases are on the hand-to-mouth order and for the time being the retailers are slowing up on their stocking operations. Prices are unchanged, on the basis of $1.30 for 4-in. block, though there is some tendency to cut prices. Salesmen are not having much success on the road and mine operations are heavily curtailed.

MIDDLE WESTERN

GENERAL REVIEW

Profound quiet prevails in all directions. Screenings still strong with no demand for other Illinois and Indiana sizes. Plans maturing for coöperation among Indiana companies.

There is no appreciable gain noted in sales and prices, with the exception of screenings, are inclined to be weak. Some shippers are of the opinion that the market is worse than last week, and that the immediate prospects are anything but encouraging. All agree that the demand is nil, yet there is a feeling that the present stagnation presages a brisk business once mid-summer is passed. Contracting continues slow and a large amount of tonnage is still unplaced. Retailers are taking no coal; the absorption of steam sizes, other than screenings, is backward considering the small output, and weather conditions are such as to cause even less than a minimum movement.

The industrial situation is showing some signs of improvement, which augurs well for the future, and the absence of stocks in the hands of retailers and consumers sustains the opinion that sooner or later a pronounced change will occur. In Chicago the strike of the building trades has reduced shipments to that point. Operations of brick, cement, concrete and crushed stone plants are practically at a standstill, and since the producers of building material are considerable users of Indiana and Illinois coal, the depressed state of the industry has had a detrimental effect.

The over-stocking of Lake coal last summer and fall is now bearing fruit, and these must be reduced before that situation will right itself. It is quite evident that the Lake business will not be active until the middle of July.

CHICAGO

Strong demand for screenings in all districts. Domestic grades generally flat except West Virginia grades. Anthracite slow.

The situation in Franklin and Williamson Counties has been enlivened by the increasing demand for screenings at higher prices. A goodly number of shipments have recently gone forward at $1 per ton. The demand for other sizes is below normal but prices are held steady.

Increasing quietness is observable in Indiana except on screenings, the supply of which hardly equals the demand. Prices of domestic sizes are not being well maintained, and concessions are being made to move what little domestic coal is screened.

The mines of the Springfield district have always shipped large quantities of coal on contracts each season, but so far this year few contracts have been closed, and only a little railroad tonnage is moving. Screenings are steadily absorbed at higher prices than last week.

The range of prices on eastern Kentucky coals is very wide, and there is little stability to the market.

The Pocahontas and smokeless situation has improved, and prices for Third Vein Pocahontas lump are strong at $1.60. Contracting progresses freely in these coals. It is now difficult to obtain shipments to this territory unless a previous allotment has been arranged. The stronger tone is probably influenced by the export situation. Splint coals have also sympathetically advanced, and are averaging perhaps 5c. to 10c. per ton better than last week.

Anthracite orders are not as plentiful as could be wished, but if the dealers fail to order this month they will be compelled to do so in the following month, or later, so that the average amount of business during the season is bound to be maintained whatever the current situation may be.

The Chicago market is now quotable as follows:

	Williamson and Franklin Cos.	Springfield	Sullivan	Clinton	Carterville

ST. LOUIS

Screenings continue the market leader. Pool of the Standard operators not maintained.

Continued quietness prevails with the exception of the screenings market, which is unusually strong. Carterville screenings sell at from 95c. to $1, and in the Standard field they are worth from 90 to 92½c. Such little washed coal as is being produced is bringing its own figures. Carterville lump has sold down as low as $1, while the general circular is from $1.10 to $1.30. The other screened sizes are holding to the same figures.

The effort on the part of the Standard operators to maintain reasonable prices is not coming up to expectations, due to the fact that some of the operators are employing questionable methods of marketing their coal. Some of those in the arrangement to sell their coal through a general selling agency, have sold lump as low as 90c., when their circular calls for $1.10, and 6-in. lump which has been quoted at $1.20 was sold as low as $1.05.

PRODUCTION AND TRANSPORTATION STATISTICS

Exports of domestic coal and coke, from the United States, and bunker coal laden on vessels engaged in the foreign trade at the specified districts, during the month of March, were as follows:

Total....	1,402,209	30,418	1,432,627	1,654,042	29,916	1,683,958

Shipments of coke entirely from the Pocahontas field, amounted to 61,075 tons.

FOREIGN MARKETS

GREAT BRITAIN

Prohibition of exports the feature of the market. Situation uncertain. Labor troubles also serious.

May 7—The coal trade of the country is somewhat unsettled and rather quiet. The decision of the Premier that the question of the miners' bonus must be considered by the District Conciliation Boards has given a little more confidence in the trade, and the results are awaited with more than the usual interest which is associated with wage questions. Another matter of grave importance is the announcement of the Government Order prohibiting coal exports except under license. This has caused considerable stir. It is understood that all ships sailing from our ports, except liners, will have to obtain from the Committee licenses specifying the quantity of coal to be exported. Restricted exports would also seriously affect shipping by depleting the outward business and throwing greater freight cost on the imported food stuffs and other commodities which form the return cargoes of coal boats.—"The Iron and Coal Trades Review."

May 4—The export of coal and coke, except under license is prohibited to all destinations other than British possessions and protectorates and allied countries, also Portugal. The uncertainty which prevails in connection with this prohibition is holding up business at present. Quotations are more or less normal as follows:

Best Welsh steam.......	Nominal	Best Monmouthshires. ..	$8.04@8.16
Best seconds...........	Nominal	Seconds................	7.92@8.04
Seconds................	$8.52@8.76	Best Cardiff smalls.....	5.16@5.28
Best dry coals.........	8.40@8.88	Cargo smalls..........	4.44@4.56

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Chartering is also greatly affected by the prohibition of exports and rates are approximately as follows:

Gibraltar.........	$4.80	Naples	$6.24	Las Palmas......	$5.04
Marseilles........	5.79	Venice..........	9.60	St. Vincent.......	5.16
Algiers...........	5.79	Alexandria.......	6.60	Rio de Janeiro....	6.60
Genoa............	6.24	Port Said........	6.60	Monte Video.....	6.00
				River Plate......	6.24

Note—These quotations are based on an exchange rate of 24c. to one shilling.

SPAIN

The Spanish imports of coal for January of the current year amounted to 118,749 tons as compared with 231,661 tons for the same month last year. Coke imports for the same periods were 9464 tons in 1915 and 29,146 tons in 1914.

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

✚Indicates contracts regarding which official information has been received.

Recast

In the following table we give a list of all old contracts coming up for consideration during the ensuing week. The table gives our contract number, the name of the purchaser, city, tonnage and page on which the detail notice appeared.

No.	Purchaser	City	State	Tonnage	Page
454	Mun. Elec. Light Dept.	Cleveland,	Ohio		875
535	Whiteside Baking Co.	Louisville	Ky.		708

677	Board of Education	Everett	Mass	2500b	876
690	Board of Education	Port Huron	Mich.	1200	877

a Indicates anthracite coal b Indicates bituminous.

Supplemental Notes

✚No. 312—Chicago, Ill.—Bids on this contract (pp. 488, 666, 748), which provides for furnishing the city with about 2000 tons of coal per month, were as follows:

Bidder	Name of Fuel	Moisture	Ash	B.t.u. per Lb. of Dry Coal	Price Delivered	*Net B.t.u. for One Cent
Martin Howe Coal Co.	Lincoln—Lincoln Co., Ill.	10	12	12,500	$1.58	137,195
Ender Coal & Coke Co.	Centralia—Marion Co., Ill.	8	15	12,300	1.62	133,522
Northern Coal Co.	Sunshine—Perry Co., Ill.	9	13	12,500	1.687	129,851
Northern Coal Co.	Springfield—Sangamon Co., Ill.	11	15	12,000	1.57	129,848
Northern Coal Co.	Centralia—Marion Co., Ill.	10	14	12,400	1.649	129,843[1]
Golsen Doan Coal Co.	Centralia—Marion Co., Ill. Warrick—Warrick Co., Ind	9	15	12,300	1.67	128,286
Edwin F. Daniels & Co.	Glenridge—Marion Co., Ill.	10	13	12,300	1.67	127,608
Peabody Coal Co.	"Shellback"—Williamson Co., Ill.	8.5	14	12,400	1.80	121,348
Consumer's Co.	2″ Screenings—Perry Co., Ill.	12	13.77	12,323	1.72	121,242

*The lowest bid is the one furnishing the greatest number of net B.t.u. for one cent. This is computed from figures furnished by bidders, as per rule in specifications.

$$\text{Net B.t.u. for one cent} = \frac{2000 \times \text{B.t.u. per lb. dry coal} \times (100\% \text{ less } \% \text{ of moisture as delivered}).}{\text{Price per ton delivered} + (\tfrac{1}{2}\text{c.} \times \text{number of } \% \text{ of ash in dry coal}).}$$

[1] Bid informal—B.t.u. as guaranteed below minimum allowed in specifications.

✚No. 486—Boston, Mass.—Bids on this contract (p. 665) will be received until 10 a.m., May 25. The contract involves 47,000 tons of semibituminous steaming coal and 6800 tons of birdseye for use at the 15 institutions of the State Board of Insanity. Specifications and proposal forms may be obtained on application. Address E. R. Libby, Room 6, State House, Boston, Mass.

✚No. 588—Everett, Mass.—The approximate requirements on this contract (p. 749), which provides for furnishing the local schools with coal during the ensuing year, are 2000 tons of anthracite, 1500 tons of bituminous mine-run and 1000 tons of screenings. All the coal is to be delivered in the bins at the various schools, as the committee may designate. Bids will be received until 8 p.m., May 28, and must be on the printed forms, which may be obtained on application. Address Chn. of Com. on Fuel Charles Manser, High School Bldg., Everett, Mass.

✚No. 592—Nashville, Tenn.—Bids on this contract (p. 750) will be received until noon, May 31. The contract will cover the fiscal year beginning June 1, 1915. Address Business Mgr. H. S. Van Doren, Bd. of Edu., Hume-Fogg High School Bldg., Nashville, Tenn.

✚No. 504—Dover, N. J.—Bidders on this contract (p. 665) were as follows, arranged in order of their excellence, according to the Government's interpretation of the analysis submitted:

	Bidder	Coal	B.t.u. per Lb.	Price Tons	Price Cents*
	Mine-run				
2	Moreland Coke Co.	Columbia	14,000	$3.30	10.61

Zone No. 3 also requires 450 tons of buckwheat No. 3 and zone 18, 600 tons of gas coal. Totals in gross tons: anthracite, 178,533; mine-run, 63,060; gas, 600; grand total, 242,193. Address Contract Clerk, Room 1226, Municipal Building, New York.

New Business

No. 713—Cincinnati, Ohio—Sealed proposals will be received up to noon, May 25, by the Board of County Commissioners of Hamilton County, Ohio, for the purchase and delivery of smokeless coal at the Court House, Armory, Morgue and the Memorial Building. The contract is to run for a period of one year from June 15. All coal must be the best smokeless for steam and heating purposes and is to be delivered in such quantities and at such times as may be necessary. All bids must be accompanied by a bond in the sum of $300 or a certified check for $100. The County Commissioners reserve the right to reject any or all bids. Address Clk. Al Reinhardt, Board of County Commissioners, Cincinnati, Ohio.

No. 714—Toronto, Can.—The Queen's Hotel is now taking bids for a year's supply of heating coal and the contract will be closed within a week or two. Approximately 1700 tons will be required, and the average price paid is $4. Address Manager, Queen's Hotel, Toronto, Can.

+No. 715—New York, N. Y.—The Immigration Commissioners at Ellis Island will receive bids until 10:20 a.m., May 24, for anthracite coal to cover their requirement during the ensuing year. Address Commissioners of Immigration, Ellis Island, New York Harbor, N. Y.

+No. 716—Puget Sound, Washington, D. C.—Sealed bids will be received until 10 a.m., June 1, for furnishing 100 tons of foundry coke (Stock No. 5) to be delivered in covered lighters alongside wharves at the navy yard, as may be directed. The deliveries are to be made during the fiscal year ending June 30, 1916, and within 30 days after receipt of order. (Government Schedule No. 8261). Address Paymaster Gen. of the Navy Samuel McGowan, Bureau of Supplies and Accounts, Washington, D. C.

+No. 717—Burlington, Iowa—The Board of Education at this place will contract about June 1 for 800 tons of mine-run coal and 1400 tons of lump. The call for bids is advertised and the purchase usually made through local dealers. The current contract is being filled with Fulton County, Ill., mine-run at $2.35 per ton, and Franklin County, Ill., 6-in. lump at $3.20 per ton. Address Fuel Committee, Board of Education, Burlington, Iowa.

No. 718—Toronto, Can.—The King Edward Hotel of this city is now in the market for 9000 tons of coal, the great bulk of which is bituminous. Tenders are not advertised for but the exact needs can be obtained by application. The usual figure obtained is considerably less than $4. Address Manager, King Edward Hotel, Toronto, Ont.

+No. 719—Revere, Mass.—Sealed proposals were received until noon, May 21, for furnishing coal required at the city buildings during the ensuing year. Specifications are on file at the office of the City Engineer. Address Mayor Arthur B. Curtis, Revere, Mass.

+No. 720—Baltimore, Md.—Sealed proposals will be received at the office of the Lighthouse Inspector for furnishing anthracite and bituminous coal during the fiscal year ending June 30, 1916. Blank proposals, etc., may be had on application. Address Lighthouse Inspector, Baltimore, Md.

No. 721—Limoges, France—An inquiry was made at this office by a correspondent for a French concern who is desirous of getting in touch with American exporters of anthracite coal with a view to obtaining a supply during the continuance of the European war. Address Leonard Rouguart, 37 Murray St., New York.

+No. 722—Toronto, Canada—Sealed proposals will be received by the Toronto General Hospital until May 25 for about 8500 tons of bituminous screenings, 40 tons of anthracite stove, 25 tons of egg and 5 tons of nut. All coal to be of the best quality. Address Secy. and Treas. A. F. Miller, Toronto General Hospital, Toronto, Can.

No. 723—Boston, Mass.—Sealed proposals will be received at the office of the Lighthouse Inspector, Boston, Mass., until May 25, 1915, for furnishing anthracite and bituminous coal for use in the second lighthouse district for the fiscal year ending June 30, 1916. Blank proposals and particulars may be obtained on application. Address the Lighthouse Inspector, 19 Congress St., Boston, Mass.

No. 724—Toronto, Can.—Bids will be received by the Lumsden Bldg. for a supply of coal from Aug. 30 until May 15. It is likely that all tenders will close before the end of May. Address, Building Superintendent, Lumsden Bldg., Toronto, Can.

+No. 725—Northampton, Mass.—Bids will be received by the county authorities until noon, June 1, for furnishing the coal required at the Court House, Jail and Hampshire County Sanatorium until Apr. 1, 1916. Philadelphia & Reading Coal & Iron Co.'s hard white ash coal is required, and deliveries are to be made in such quantities and at such times as required. Address County Commissioners, Court House, Northampton, Mass.

+No. 726—New York—Sealed bids will be received by Fire Commissioner Robert Adamson until 10:30 a.m., June 1, for furnishing and delivering anthracite coal for use on the Fire Boats of the Department, for the period ending Apr. 1, 1916. Blank forms and further information may be obtained on application. Address Robert Adamson, Fire Com., Municipal Bldg., New York City.

+No. 727—Muncie, Ind.—The Board of Education at this place will be in the market some time during next month for approximately 1200 tons of West Virginia splint coal. The call for bids is advertised, and the business done on a competitive basis. Address Board of Education, 445 The Johnson, Muncie, Ind.

+No. 728—Bryan, Ohio—Bids will be received by the Board of County Commissioners of this place until 1 p.m., June 8, for furnishing 125 tons of anthracite furnace coal. Address County Auditor C. R. Lowe, Bryan, Ohio.

+No. 729—Vicksburg, Miss.—Sealed proposals will be received until noon, June 1, for furnishing about 10,000 tons of bituminous coal to contractor's barges engaged in the Third Mississippi River District. Complete details and specifications may be had an application. Address Maj. Engrs. J. R. Slattery, U. S. Engr. Office, Third Mississippi River District, Vicksburg, Miss.

+No. 730—Louisville, Ky.—The Board of Education at this place will receive bids until 3 p.m., May 26, for furnishing the annual supply of coal for the fiscal year beginning July 1. All bids must be accompanied by a certified check for varying amounts, dependent upon the amount of the bid. The requirements are as follows: Western District, 1923 tons of nut and slack, 195 tons of lump, 115 tons of mine-run. Central District, 3267 tons of nut and slack, 64 tons of lump, 837 tons of mine-run. Eastern District, 1087 tons of nut and slack, 127 tons of lump, 383 tons of mine-run. Bids must include all expenses incident to the delivery and storage of the coal. Full details and proposal forms may be obtained on application. Address Business Dir. Samuel D. Jones, Administration Bldg., Eighth and Chestnut St., Louisville, Ky.

No. 731—Toronto, Can.—The Prince George Hotel is said to be in the market for a year's supply of bituminous coal. The average yearly consumption is 2000 tons. Address, Manager, Prince George Hotel, Toronto, Can.

No. 732—Marshall, Minn.—The Electric Light & Water Works Plant at this place will be in the market some time during June for about 20,000 tons of Elkhorn (Kentucky) screenings. The business is usually done at about $4.55 per ton, and the call for bids is always advertised. Address Supt., A. L. Fields, City Electric Light & Water Works Plant, Marshall, Minn.

No. 733—Providence, R. I.—Sealed proposals will be received by the Board of Control and Supply until 10 a.m., June 10, for furnishing the coal supply. Specifications and information may be obtained on application. Address Secy. Gilbert R. Parker, Bd. of Control and Supply, Room 18, State House, Providence, R. I.

+No. 734—Brookings, S. D.—The Light, Heat & Water Department at this place will be in the market some time during June for approximately 2000 tons of Wilmington (Illinois) coal. The contract is made on a competitive basis and is usually closed at about $4.20 per ton delivered. Address Supt. A. W. Morton, Light, Heat & Water Dept., Brookings, S. D.

+No. 735—Davenport, Iowa—The Board of Education here usually contracts the second Monday in June for its annual requirements of coal involving about 2200 tons of lump and 700 tons of slack coal. The call for bids is advertised in the local papers and the business done on a competitive basis. Address Secy. J. D. McCollister, Bd. of Edu., 1144 Main St., Davenport, Iowa.

+No. 736—Covington, Ky.—The Board of Education at this place will be in the market some time during June or July for about 500 tons of 2-in. lump coal. The call for bids is advertised, and the coal bought in carload lots. The usual price is about $1.30 per ton at the mine. Address Business Dir. W. A. Shore, Bd. of Edu., Covington, Ky.

+No. 737—Charleroi, Penn.—The Board of Education here received bids till 7 p.m., May 18, for furnishing approximately 18,000 bu. of mine-run coal to be delivered to the various school buildings. Address Secy. T. M. Faddis, Bd. of School Directors, Charleroi, Penn.

+No. 738—Flint, Mich.—Bids were received until 10 a.m., May 18, for furnishing the Michigan School for the Deaf at Flint, Mich., with approximately 2500 tons of bituminous coal during the year, beginning July 1. Specifications may be had on application. Address Steward H. R. Niles, Michigan School for the Deaf, Flint, Mich.

+No. 739—Joliet, Ill.—The Board of School Inspectors at this place will contract some time during June or July for approximately 2500 tons of coal. Pana lump is being used at present which costs about $2.50 per ton delivered at the school buildings as required. The call for bids is advertised. Address Board of School Inspectors, Library Bldg., Joliet, Ill.

+No. 740—San Antonio, Tex.—The Board of Education of this place will be in the market some time during June or July for their annual requirements of coal involving about 750 tons. The best commercial McAlester lump coal is used, the current contract being closed on the basis of $6.85 per ton. About 600 tons is delivered in the summer, and the balance as required. The call for bids is advertised. Address Business Agent of the Board, Prudential Bldg., San Antonio, Tex.

+No. 741—Catasauqua, Penn.—Sealed proposals will be received by the local Board of Education until 7:30 p.m., May 28, for furnishing 300 long tons of stove coal to the local schools. Address Secy. C. H. Riegel, Borough of Catasauqua, Catasauqua, Penn.

+No. 742—Saginaw, Mich.—The Board of Education at this place will be in the market during the latter part of next month for their annual requirements of coal involving about 1300 tons of steam lump and 2000 tons of slack. The lump coal is used at the Ward Schools and the Slack at the Training School, the cost of the former being about $2.90 and the latter $2.30. The present contract on the lump coal is being supplied from the Caledonia Mines in Saginaw County, Michigan, and the slack is being furnished from the Bliss Mine in Swan Creek County. The call for bids is advertised and the business let on a competitive basis. Address Business Agt. W. E. Klumpp, Bd. of Edu., Saginaw, East Side, Mich.

+No. 743—Demopolis, Ala.—The Electric Light & Power Co. at this place will be in the market some time during next month, or in July, for their annual requirements of coal involving about 1500 tons of mine-run. The business is usually let at about $2.40, and the call for bids is advertised. Address Purchasing Agent, Demopolis Electric Light & Power Co., Demopolis, Ala.

+No. 744—Moultrie, Ga.—The Electric Light Department at this place will be in the market some time during the summer for their annual requirements of coal involving about 200 tons of screened mine-run. It is understood that the business is not let to competitive bids and the current contract is being filled at $3.20 per ton. Address J. M. George, City Light Dept., Moultrie, Ga.

+No. 745—Houston, Texas—The Board of Education here will be in the market about June 20 for their annual requirements of coal involving about 900 tons of Alabama 6-in. lump. The current contract is being filled at $4.65 per ton delivered at the buildings. The call for bids is advertised. Address Public School Board, Houston, Tex.

+No. 746—Seattle, Wash.—The School Board at this place will be in the market some time during June or July for their annual requirements of coal involving about 8000 tons of mine-run. The present contract is being filled on Black Diamond coal at about $4.15 per ton delivered at the schools. The call for bids is advertised. Address the School Board, 347 Central Bldg., Seattle, Wash.

+No. 747—Pittsburgh, Penn.—Sealed proposals will be received until 10 a.m., May 25, for furnishing the coal requirements at nine different pumping stations and the Pittsburgn City Home and Hospital and the North Side City Home during the fiscal year beginning June 1. Specifications and blank forms may be had on application. All bids must be accompanied by a suitable bond as provided by the city ordinances. Address Dir. F. P. Booth, Dept. of Supplies, 314 Oliver Bldg., Pittsburgh, Penn.

+No. 748—Detroit, Mich.—Sealed proposals will be received by the Dept., of Parks and Boulevards until May 24 for furnishing coal as follows: 1000 tons of bituminous nut, pea and slack for delivery at the Power Plant on Belle Isle Park; 300 tons of bituminous lump or smokeless lump, anthracite, for delivery at the same place; 300 tons of smokeless lump for delivery to road rollers; 200 tons of anthracite stove or egg or smokeless lump for delivery at Palmer Park, Clark Park and City Barns. Address Secy. H. W. Bush, Dept. of Parks and Boulevards, 201 City Hall, Detroit, Mich.

+No. 749—Perrysburg, N. Y.—Bids will be received until May 29, for supplying the J. N. Adam Hospital at this place with 2500 tons of three-quarter bituminous coal and 500 tons of anthracite. Delivery to be made during the fiscal year beginning with July. Address Supt. Clarence L. Hyde, J. N. Adam Hospital, Perrysburg, N. Y.

No. 750—Hartford City, Ind.—The contract of the City Government for their fuel supply expires about the first of next month, and the City Council proposes testing out various grades of coal before closing a new contract. The present contract is with the Norfolk & Chesapeake Coal Co. on the basis of $1.10 per ton, f.o.b. mines. Several coal companies are investigating the possibilities of obtaining the business, which involves about two car loads a month. Address City Council, Hartford City, Ind.

+No. 751—Washington, D. C.—Sealed bids will be received until 10 a.m., June 1, by the United States Navy (Schedule 8288, Steam Engineering) for furnishing anthracite and bituminous coal during the fiscal year beginning June 30, as follows: Portsmouth Navy Yard 75 tons of pea; 150 tons of egg; 120 tons of stove. Boston Navy Yard 100 tons of anthracite stove; 325 tons of egg coal, 5 tons pea coal. West Hingham (Mass.) Naval Magazine, 150 tons anthracite. Iona Island, N. Y., 2000 tons pea; 60 tons egg; 75 tons nut. Fort La Fayette, N. Y., 50 tons egg coal. Naval Hospital, N. Y., 2000 tons of broken, best quality of white ash and 50 tons of stove same grade. Brooklyn, N. Y. 200 tons Cumberland coking coal. Philadelphia Navy Yard, 25 tons of anthracite nut; 150 tons anthracite broken; 100 tons anthracite stove. Philadelphia Naval Home. Quotations are requested on approximately 2000 tons of anthracite, pea, buckwheat, rice and barley, deliveries to be made in 100 ton lots. Washington Navy Yard, 3000 tons egg coal; 150 tons of red ash stove; 300 tons of white ash egg; 500 tons pea coal. Norfolk Navy Yard 300 tons of anthracite broken; 85 tons of anthracite; 85 tons of white ash furnace. Norfolk Naval Hospital 150 tons of anthracite, 150 tons of white ash stove. Address Paymaster Gen. U. S. Navy Samuel McGowan, Washington, D. C.

+No. 752—Washington, D. C.—Sealed proposals will be received by the U. S. Navy (Schedule 8287, Ordnance, Construction and Repair, and Steam Engineering) until 10 a.m., June 1, for furnishing coke as follows: Portsmouth Navy Yard (Kittery, Me.) 100 tons, 72-hr. foundry, and 250 tons egg coke. Boston Navy Yard, 250 tons hard coke. Brooklyn Navy Yard, 4000 bu. gas coke. Philadelphia Navy Yard, 120 tons nut coke; 500 tons Connellsville 72-hr. foundry. Washington Navy Yard, 1000 tons coke. Norfolk Navy Yard, 800 tons 72-hr. foundry coke. South Carolina Navy Yard, 450 tons cupola coke. Deliveries are to be made during the fiscal year beginning June 30. Address Paymaster Gen. of the Navy Samuel McGowan, Washington, D. C.

+No. 753—Irvington, N. J.—The Board of Education at this place received bids up to May 20 for supplying coal to the local schools. As a result of a protest regarding the phraseology of the first call for bids, all proposals received were returned unopened, and new bids will be asked for. Address Chn. of the Supply Com. Bd. of Edu., George H. Smalley, Irvington, N. J.

+No. 754—Edgewater, N. J.—The Board of Education at this place will receive bids until 8 p.m., May 28, for furnishing 175 tons of anthracite egg coal for immediate delivery to the four schools in the borough. Address District Clk. Thomas F. Rigney, Municipal Bldg., River Rd., Edgewater, N. J.

+No. 755—Lakewood, Ohio—The Board of Education at this place will receive bids until noon, June 8, for furnishing 2000 tons of semibituminous coal to the local schools during the season 1915-16. Bids are requested on either lump or mine-run and are to include the cost of delivery to the various public schools and trimmed as directed. Specifications may be had on application, and bids must be submitted on blanks furnished for that purpose, accompanied by a certified check for $100. The successful bidder will be required to furnish a security bond for $1000. Address Clk. P. T. Harrold, Bd. of Edu., High School Bldg., Warren Rd., Lakewood, Ohio.

Contracts Awarded

+No. 367—Dunkirk, N. Y.—This contract (p. 566), which provides for furnishing the City Water Works with 8000 tons of nut and slack coal, has been awarded to the **Valley Camp Coal Co.** at $1.99 per ton. Address Secy. Baumgartner, Bd. of Water Comrs., Dunkirk, N. Y.

J. Kating,** $3.29 per ton for mine-run coal delivered in bins at the Water Works Plant. Address City Clk. C. G. Finch, Newton, Iowa.

+No. 605—New York, N. Y.—This contract (p. 795), which provides for furnishing 650,000 lb. of egg coal for delivery at the city Asphalt Plant, has been awarded to the **Meyer, Denker Sinram Co.,** at $1755. The William Farrell & Sons bid $2.90 per ton or gross of $1885. Burns Bros. bid was $2.97 per ton or $1930.50. Address Pres. of the Borough Marcus Marks, Room 2034, Municipal Bldg., New York.

+No. 611—Ada, Minn.—This contract (p. 795), which provides for furnishing the Local Water & Light Plant with coal during the fiscal year terminating Apr. 1, 1916, has been awarded to a local dealer. The price was $3.30 f.o.b. Duluth, or Superior, for Youghiogheny, screened lump coal. We are advised that the purchasers were unable to obtain any competitive bids on this contract, the five proposals submitted, all quoting the same price. Address Clk. Peter Sharpe, Water & Light Com., Ada, Minn.

+No. 631—Milwaukee, Wis.—This contract (p. 795), which provides for furnishing coal to the Department of Public Works, has been awarded to **Frank Gross, Jr.,** at $2.97½ per ton. Address Deputy Com. of Pub. Wks. Percy Braman, Dept. of Pub. Wks., Milwaukee, Wis.

+No. 632—Phillipsburg, N. J.—This contract (p. 796), which provides for furnishing the local Board of Education with its fuel requirements for the ensuing year, has been awarded on the following basis: Stove, $6.05; chestnut, $6.20; pea, $7.45, all per gross ton. Address Secy. Geo. W. Smith, Board of Education, Phillipsburg, N. J.

+No. 633—Hot Springs, S. D.—This contract (p. 796), which provides for furnishing the National Home for Disabled Volunteer Soldiers with 9000 tons of lignite coal, has been awarded to **Peter Kooi,** Kooi, Wyo., at $3.40 for mine-run coal. This was the only bid received on this contract. Address Treas. and Quartermaster William H. Stanley, N. H. D. V. S., Hot Springs, S. D.

+No. 639—Boston, Mass.—This contract (p. 796), which provides for furnishing the Franklin Union Building with approximately 200 tons of coal has been awarded to **F. C. Warren & Bradford Co.,** at $4.17 per ton, with a guarantee of 14,300 B.t.u. The City Fuel Co. bid $4.24 on a guarantee of 14,400 B.t.u., and the Staples Coal Co. $4.23 on a guarantee of 14,500 B.t.u. Address, Pres. Richard Olney, Franklin Foundation, Berkeley St., Boston, Mass.

Contract Notes

Argentina—Beginning Apr. 1, 1915, the Central Cordoba Ry. will burn wood instead of coal in its locomotives. The road has been importing 80,000 to 100,000 tons of Welsh coal a year at Rosario. The Santa Fé and Government lines already consume considerable quantities of wood fuel and, according to newspaper reports, other companies are considering its use.

Spain—An American consular officer in Spain transmits the names and addresses of a number of leading coal importers and merchants in his district. Correspondence should be conducted in Spanish.

Germany—Germany has notified Sweden that coal will hereafter be regarded as unconditional contraband. Six neutral colliers, it is stated, are now held by the Germans, whose aim is supposedly to stop the exportation of coal to Scandinavia.

New York—The recent announcement that B. Nicoll & Co., of this city, has been appointed exclusive sales agent of the Clinchfield Coal Corporation for the territory in the United States and Canada north of the Ohio River and Hampton Roads, Va., was of much interest to the trade. L. G. Bruder, the Chicago manager of Nicoll & Co. will look after the sales, which will be vigorously pushed.

Buffalo, N. Y.—The bids for supplying 1000 gross tons of mine-run bituminous coal for the Buffalo Post Office were: Marine Coal Corporation, $2.85; Buffalo Fuel Co., $2.88; Spaulding & Spaulding, $2.88; Fairmont Coal Co., $2.90.

Lyon, France—Direct shiploads of anthracite come from time to time from England. Both English and Belgian anthracite are used here in large quantities, and they sell at an average price of from 7 to 8 francs ($1.35 to $1.55) per 100 kilograms (220.46 lb.) in normal times, although the price at present has increased about 25.%

Railroad Coal Cars—On June 30, of last year, there were 899,314 coal cars in the United States having an aggregate capacity of 40,583,490 tons. The average number of freight cars per 1000 mi. of line was 10,121,

Leominster, Mass.—The Hadley Coal Co., at this place, has been awarded the contract to furnish the local public schools with coal during the ensuing year at $7.25 per ton for egg and $7.35 per ton for stove.

Albany, N. Y.—According to press reports, the contract for furnishing the filtration plant and Quackenbush pumping station at this place has been awarded to the **C. M. Stuart Coal Co.,** at $28,780.

Great Britain—The committee of the British Board of Trade which has been investigating the state of the coal trade has recommended as follows: (1) That exports to neutral countries should be restricted. (2) That steps be taken at once to consult with local public bodies regarding the question of accumulating large storage reserves of coal in or near London for use of the small consumers next winter. (3) That freight rates on interned steamers be reduced. (4) That enemy ships condemned by the prize court be taken over by the Government and used for coal transport. (5) That the Government assume control of the output of collieries during the balance of the war, should prices not soon return to a more reasonable level.

RUN-OF-MINE TALKS

ON YOUR BUSINESS AND OURS

By the Business Manager

"THE OUTSIDE POINT OF VIEW" is a healthy one for each and all of us to get once in a while.

Just because we are in the coal business is no reason why we shouldn't be interested in a whole lot outside of it.

In "*Advertising and Selling*" for May, Herbert N. Casson, writes, along this line:

"It is physically impossible for a man to see more than two sides of a square house at one time. It is necessary to project oneself mentally to imagine the other sides. But to have it under really close observation, you must have someone else help you, from a different vantage point than your own.

The same thing is true of business. No organization can hope to see all its sides unaided. It must have outside point of view, or work on a distorted basis.

This is the rock on which thousands of stubborn business men split. And this is the magnificent opportunity which scores of brainy men have seized to wrest leadership from those too dull to see their own benefit.

It is a matter of history that general improvements come from outside and that detail improvements come from inside.

For instance—

Field was a merchant, yet he laid the first ocean cable.

Bell was a professor of elocution, yet he invented the telephone.

Carnegie was a railroad official, yet he became the richest steel maker in the world.

Judge Gary is a lawyer, yet he is at the head of the American Steel Trust.

Allis was an auditor, yet he created the Allis-Chalmers Works at Milwaukee.

Ingersoll, who gave the world good cheap watches, was not a watchmaker.

Selden, who secured the first automobile patent, was a lawyer.

Eastman, creator of the Kodak, was a bank clerk.

Harriman, the greatest of American railway organizers, was a stock broker.

Even in the larger affairs of national history we find this extraordinary law. Cromwell, for instance, was an outsider; he was not born of royal blood; and Napoleon, who put kings up and pulled kings down until they sent him to St. Helena, was an outsider.

The most desirable thing in the world is *balance*. Balance means sanity, it also means success. It is the balanced man and the balanced business that win—aided by the outside point of view to achieve such balance."

COAL AGE

Vol. 7 NEW YORK, MAY 29, 1915 No. 22

Unintentional Distortion

WE have recalled many times the accompanying observation of Pascal's in following the testimony developed by the Federal Industrial Relations Commission and we have wondered what might be the effect of placing that remark on a wall conspicuously before all of the witnesses as they give testimony.

Any one can talk interestingly if questioned as to his opinion about someone else, but such testimony as a rule has little value beyond its power to entertain; and yet more than half of the commission's questions, at least so far as the mining industry is concerned, could be answered by pure gossip.

If we substitute thought for "said" in Pascal's remark, it would no longer hold water; who believes that the majority of Union men in Colorado or elsewhere look upon the operators of coal mines as being one-half as black as they are so willing to picture them?

It does not necessarily follow that such testimony is rehearsed beforehand "with malice aforethought" any more than it follows that ordinary gossip originates from evil intent. It just happens that the normal human mind has a way of being led far afield by the imagination if the imagination is given half a chance.

> I hold it to be a fact that if all persons knew what each said of the other there would not be four friends in the world.

This quotation is a bit of wisdom left by Pascal, who devoted several years of his life to the collecting of proverbs.

The truth of this has been brought out time and again in public hearings held by boards of arbitration, and it is even used as an argument by most, if not all, the opponents of arbitration.

An employee that has been contented with his surroundings and conditions of employment is more than liable to give the most startling testimony, providing the audience seems to demand it and the questions suggest it. After the hearing is concluded, the man himself will probably not be able to give any satisfactory explanation for his action if questioned.

And yet of hearings and investigations there is apparently to be no end. We are all too apt to see only the abuse of a thing. The abuse is nothing against the proper use.

Out of the present world-wide turmoil let us hope there will come an era of moral fellowship for employer and employee, as well as an age of good-will on the part of great nations. Then benefactors will forget what they have given, and beneficiaries will remember what they have received. Laws will be created to reform the individual rather than to punish him.

Crime will be treated preventively rather than retributively.

A Modern Coal Mine in Iowa

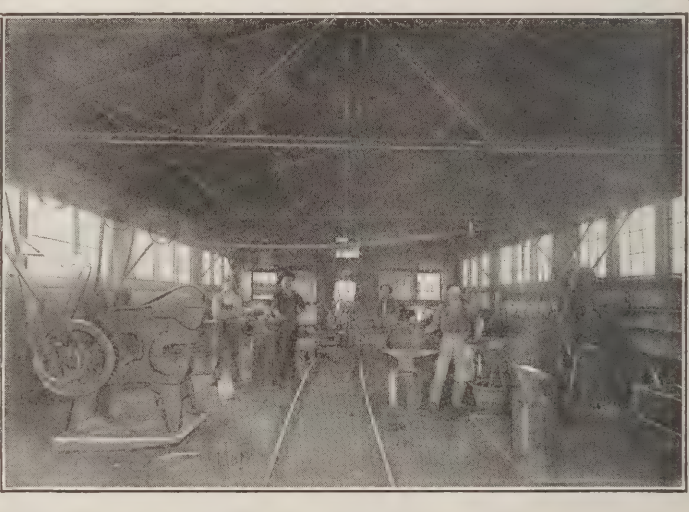
By Willis P. Thomas*

SYNOPSIS—Description of a comparatively new operation where advanced ideas in the matter of concrete and steel construction have been carried out. Electric hoisting and electric haulage are employed. The system of screening and picking the coal is quite efficient.

Situated 40 miles south of Des Moines, Iowa, on the Rock Island "Short Line" is the Electra mine of the Consolidated Indiana Coal Co. This company, which is owned by the Rock Island R.R. through stock ownership, has approximately 4500 acres of Iowa coal, the bulk of which lies in Marion County. Electra mine, which is one of the most modern plants in the Middle West, was located in the center of the company's holdings to serve as the central power plant for all future developments in the field. Power is also sold to nearby towns for lighting purposes and commercial use.

As the country is quite rough considerable heavy grading was required to construct the gravity yards, which have a capacity of 75 empty cars and 75 loads. Track scales were installed for the weighing of empty and loaded cars, accurate weights thus being secured.

Tipple and Storage Bin



Interior of Shop

The Mine Tipple

The tipple which spans three tracks is constructed of steel throughout, the headframe having a concrete covering to prevent corrosion from moisture and gases rising out of the shaft. In order to better control the dumping of the coal, the hoisting engineer is located in the tipple, standing directly in front of the dump. He is thus enabled to use a speed in dumping which will secure proper screening over the bars with a minimum breakage of the coal. After being dumped the coal passes over a 6x12-ft. bar screen. The bars in this screen have a 1⅜-in. spacing, the lump going into the weigh-pan.

This weigh-pan is provided with a two-way gate. Dumping one way, the coal passes to the shaker screen; dumping the other way, the coal passes over a chute suspended over the shaker to the lump-track direct. Mine-run coal can also be loaded over this chute by covering the bars with flat sheets. The shaker screen, which is connected by toggles with an electric motor, makes slack, egg and lump coal. The egg coal, which carries practically all of the dirt and impurities, is run over a picking table to insure a thoroughly clean preparation.

The tipple is so arranged that if necessary the egg coal can be loaded in box cars as well as the lump. If there should be a temporary shortage of cars the slack coal can be run into a 200-ton capacity storage bin which is located directly in front of the boiler plant. This bin is also used as storage for boiler coal, the slack being spouted direct to the stoker hopper. This location of the storage bin is economical as it serves a double purpose.

Boiler and Engine Rooms

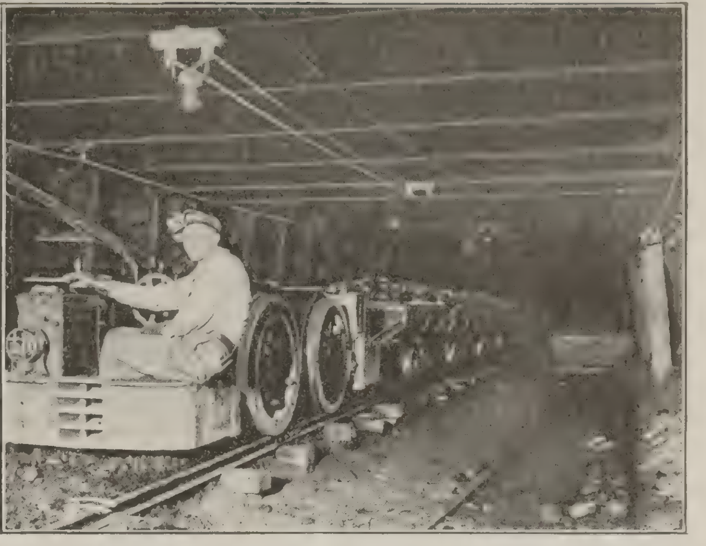
The boiler and engine rooms are located a short distance from the tipple and adjacent to the mine tracks. The buildings are of brick-and-steel construction. The ends of the buildings are of corrugated iron so that they can be readily taken down whenever it is necessary to install additional equipment. The boiler room at present contains two Geary 300-hp. water-tube boilers equipped with Illinois chain-grate stokers, feed-water heater and feed pumps in duplicate. Draft is furnished by a steel stack 5 ft. in diameter and 135 ft. in height. The ashes from the stokers drop off at the rear end of the boilers into a small hopper and are blown out through an 8-in. pipe by steam into a ravine back of the boiler plant.

The engine-room equipment consists of a 660-kw. General Electric generator driven by a Curtis condensing steam turbine, a 100-kw. motor-generator set for haulage and mining machines and the hoisting engine, which is driven by a 350-hp. induction motor using 2300 volts. In the basement of this building are located the vacuum pump and condenser. One interesting feature of this boiler and engine-room installation is that one man operates it all, even to the disposal of the boiler-plant ashes. Hoisting is done through a concrete shaft, the concrete being cast around a steel framework. The design of this

---

*Mining engineer, Des Moines, Iowa.

View at Shaft Bottom Showing Steel Timbering



Motor and Trip Entering Shaft Bottom

shaft was made by Carl Scholz, general manager of the company, and is something entirely new in concrete construction. The design gives great strength and large clearances for the passage of air while hoisting is taking place. The coal seam is reached in the shaft at a depth of 185 ft. The second opening to the underground workings is through a slope driven at an angle of 17 deg. Here steel timbering is used, and a concrete partition divides the slope into two compartments, one of which is used for an airway and the other as a manway. The second compartment is also used to handle supplies into the mine. With this arrangement it is possible to handle coal through the shaft the full 8 hours without interruption.

The Shaft Bottom

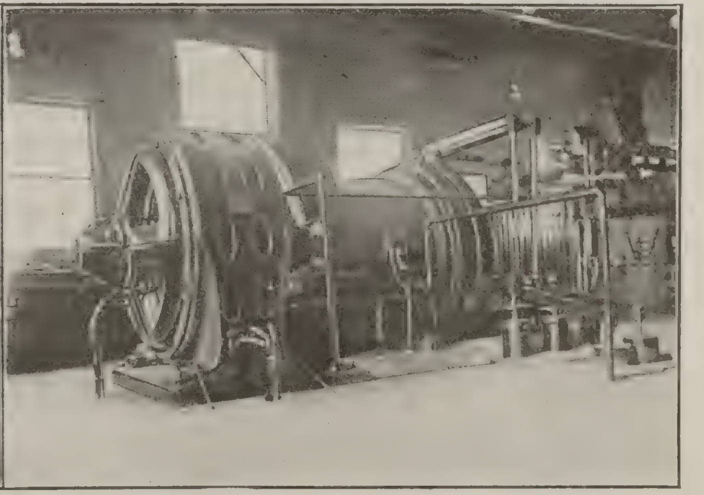
The shaft bottom is 16 ft. wide, double tracked and timbered with steel, the caging being done from one side on gravity tracks. The empties are elevated by two-car hauls to such a height that they run by gravity back to the main east and west haulage roads, where they are picked up by the motors. All of the main haulage as well as most of the gathering is done with electric motors. The seam is quite rolling, resulting in grades as high as 12 per cent. against the loads in some rooms. Where this is the case gathering motors with independent-driven crabs are used to bring the cars to the entries.

Quite a little steel timbering has been done, especially on permanent air-courses. Main haulage roads which have a 36-in. gage are laid with 25-lb. steel on 4x5-in. wooden ties. Room tracks are laid with 16-lb. steel placed on steel ties. These ties are found to be of great advantage in the low coal as they take up very little in height and are more economical than wooden ties because they may be used over and over. A telephone system connects the underground workings with the mine office, power house and shop as well as the tipple.

Pick and machine mining are both in use. Machine mining is done with shortwall machines which cut rooms with a double track and a 60-ft. face. It has been found that the roof stands as well under these conditions, if the timbering is done properly, as it formerly did in a 25-ft. room.

Miners' dwellings have been built about a half a mile from the plant, each house being of different design and painted a color different from the house adjoining. The effect is pleasing to the eye and gives each place an individuality of its own. Each house has a large lot with ample space for a garden in the rear. Water is supplied from a large reservoir to the whole townsite. The management's idea in building a superior class of houses is to attract a better class of men and to promote better living conditions. The plan seems to have been successful.

Hoisting Engineer and Car Just Finished Dumping



Electric Hoist Operated from the Mine Tipple

The Air Factor in Dust Explosions

By John Verner*

SYNOPSIS—Objection to use of facts of limited application to establish a general rule. A brief outline of facts essential to explosive combustion. The Eskmeals tests taken for illustration. Effect of draft to produce and maintain explosive combustion. The counter-current theory defended. The condition of the air factor important. The Illinois investigations. Explosion in a drift mine. The Royalton explosion. Influence of temperature and barometer on explosive conditions in mines. The position of the cannon in a testing gallery important. The results and hasty conclusions in the Bruceton tests.

In the introductory remarks of *Bulletin* 83, issued by the Bureau of Mines and entitled "The Humidity of Mine Air," having special reference to coal mines in Illinois, the following statement appears:

> Experiments in the gas-and-dust gallery at the Pittsburgh testing station of the Bureau of Mines verified the fact that certain dusts that explode violently when dry are rendered inert by proper humidification of the atmosphere within the gallery, and the importance of humidity as a factor in limiting the inflammability of coal dust in a mine is demonstrated by the fact that there has never been in Illinois a dust explosion during the summer months, whereas the records show a number of dust explosions during cold weather. It is easy to see that the warm moisture-laden air that enters a mine in the summer must deposit moisture on cooling, whereas the cold and relatively dry air that enters in winter must take up moisture as it becomes heated in traveling through the mine.

The *ex parte* presentation of a case should not be depended on to ascertain the full truth, as in many instances such presentation may be positively misleading. Some of the facts given in the above statement apply only to conditions peculiar to coal mines in Illinois and do not apply to conditions in mills in the same state where dust explosions have occurred and their occurrence was also confined to the cold season of the year.

The use of these facts of limited application, with the obvious intention of creating the impression that the principal cause of all dust explosions in Illinois was the increased dryness of the dust in winter, is objectionable; because, although the facts may seem to furnish a plausible and easy reason for the persistent occurrence of explosions in the mines during the colder months, they fail utterly to explain the likewise persistent occurrence of explosions in the mills in winter, and therefore the truth of the inference suggested in the bulletin becomes a matter of doubt even if it is applied to mines only.

Initiation and Propagation of an Explosion

There can be but one process of starting and propagating explosive combustion, and it must be essentially the same under all conditions. It must be fundamentally the same whether such combustion takes place in a mill or a mine or whether the primary igniting agent is a spark, a gas flame, a mine fire, a blownout shot or an explosion of firedamp.

In order to discover this process there must first be a thorough understanding of the fundamental facts. Explosive-dust combustion is possible only when the following essential factors are present to participate in its production: 1. Flame. 2. Combustible dust. 3. An air current or draft toward the source of heat, to bring the dust and air in contact with the flame.

It is true that the fineness and dryness of the combustible dust determine in a measure its inflammability and ease of ignition. But although this is a favorable factor, it is not sufficient of itself to cause explosion, which is determined by the rate and completeness of the combustion; and these invariably depend on (1) the temperature of the flame producing ignition and (2) the character of the air supply or draft that brings the dust in contact with the flame.

Illustration Furnished in the Eskmeals Tests

The following case will serve as a fair illustration to show the process by which combustion is brought to the explosive point. In some of the tests in the Eskmeals gallery resulting in explosion a gas flame was about 10 ft. in length and a foot in diameter. The dust was placed on shelves and was put in suspension by the shelves being upset after the gas was lighted. There was no mechanically produced draft, but it is clear that as soon as the gas was lighted the air commenced to move toward the flame. It is obvious also that this movement of air or draft carried with it some of the dust in suspension, which was thus brought in contact with the flame. The ignition of the dust enlarged he flame and increased the heat, and this condition in turn caused a stronger draft, which furnished a greater air and dust supply to further increase the rapidity, range and temperature of the combustion. This progressive process continued until the temperature reached the required point and the air and dust supply provided by the draft was large enough to cause the first manifestation of explosive combustion.

It has been suggested that the presence of draft to bring dust in contact with the flame is not necessary under the assumption that explosive combustion is produced by conductivity or radiation; or, in other words, that the continued explosive ignition of the dust particles occurs in about the same manner as the ignition of a train of gunpowder, strung along the ground and fired at one end. However, the results of numerous experiments have shown the fallacy of this view.

Conclusions Drawn from the Eskmeals Tests

Evidence that the propagation of explosive combustion is produced essentially by the same process that produced the first manifestation of explosive combustion in the gas-flame test may be found in Dr. Wheeler's letter, Coal Age, Vol. 6, p. 761, regarding the effects observed during the progress of certain experiments made at Eskmeals. Following is a brief quotation from the letter:

> The first air movement is the concussion wave from the cannon (which travels with the speed of sound in air at the temperature of the gallery). There is then a pause of maybe a second or two before a rushing noise is heard, and flame can be seen (through small holes in the side of the gallery). When the flame reaches within 150 or 200 ft. of the open end of the gallery these "spurts" and "halts" are manifested by corresponding outbursts of smoke and inrushes of air at the open end. There is an interval sometimes of several seconds between successive spurts of the flame.

---

*Former state mine inspector, Chariton, Iowa.

It will be noted that in the tests referred to in Dr. Wheeler's letter the primary means of ignition was a blownout shot and, in the other test mentioned above, it was a gas flame. Essentially the same ultimate effects were produced in each case, the only difference being that in the former a shorter method was used of getting the explosion under way, because the blownout shot practically took the place of the first manifestation of explosive combustion in the gas-flame test, thus cutting out the preliminary stages leading up to the production of the first explosive effects in the latter case. Then, as surrounding conditions were the same, the action and effects of the blownout shot in one test and of the first manifestation of explosive combustion in the other were also substantially alike, in kind if not in degree, and therefore the process of flame propagation must have been the same in both. That the propagation of flame was not effected by conductivity or radiation is clearly shown in Dr. Wheeler's letter, for had this been the case, there would have been no "interval, sometimes of several seconds, between successive spurts of the flame."

Dr. Wheeler's observations show that there was no difference, except perhaps in the magnitude of the immediate effects produced by the explosion either from the cannon or any subsequent explosive combustion of the dust. Hence, the immediate effects of the shot from the cannon can be considered as typical of all. The first of these effects was the concussion wave from the cannon, which drove the air and dust away from and beyond the reach of the flame. The latter, being thus more or less cut off from the necessary air and fuel supply, was halted in its progress and began to shrink. As a result its temperature and the temperature of the immediate surroundings decreased. This condition caused the formation of a partial vacuum around the dwindling flame that not only arrested the further progress of the concussion wave, but caused a reflex air movement or counter-current to set in toward the flame. This counter-current again brought sufficient air and dust into contact with the flame to cause a renewal of explosive combustion.

Effect of Draft to Produce Explosive Combustion and Propagation

It will be seen, therefore, that there was no essential difference between the process of propagation and the process by which the first manifestation of explosive combustion was effected in the gas-flame test. In the latter case the draft that brought the air and dust into contact with the flame—a draft caused by the effects of heat only—was comparatively sluggish and weak, while in the other case the draft or counter-current due to both the combined effects of heat and the partial vacuum formed about the flame moved more quickly and was of greater force.

As the explosion progressed, in addition to the partial vacuum about the flame due to the contraction following each subsequent explosive combustion, another partial vacuum developed in the area behind the flame. These two vacuums are separate phenomena, although they may act in conjunction to a greater or less extent. However, their combined action is not essential in the process of propagation, for it was shown above that the effects of the partial vacuum immediately in front and about the flame were alone sufficient to cause a counter-current strong enough to provide an adequate air and fuel supply for the further enlargement of the flame and the renewal of explosive combustion.

It should be understood that in all the tests at Eskmeals, in which the alternate spurts and halts of the flame were observed and where the alternate outrushes of dust and smoke and inrushes of air were both visible and audible, the gallery was open at one end and closed at the other, the cannon being located near the closed end. Every one of these tests furnished unmistakable and conclusive proof of the presence of the counter-current. But there were other tests at Eskmeals with both ends of the gallery open, and regarding their results Dr. Wheeler states in his letter to which I have referred: "No such phenomena (alternate spurts and halts of flame, etc.) occur when the gallery is so arranged that air can enter freely behind the flame."

Influence of the Counter-Current

This closing statement in Dr. Wheeler's letter has been offered as conclusive proof of the faultiness of the counter-current theory, Coal Age, Jan. 9, p. 94, one writer even claiming that there could be no counter-current in a mine having two openings. In answer to that claim I will only mention the fact that in the second Lick Branch explosion the presence of the counter-current was convincingly proved, and that mine had at least three openings to the surface. The fact that a thing is not readily distinguished is not sufficient proof that it does not exist. Under certain conditions, for instance, the exhalations and inhalations of a man may be plainly visible and audible, while under other conditions "no such phenomena occur." Now it would be absurd to suggest that, because the inhalations and exhalations could not easily be distinguished, the man had ceased to breathe.

When the retarding and reflexive influence of the partial vacuum formed in the wake of the flame is materially reduced or perhaps entirely removed, by the access of air from the rear, the following changes in effects may be reasonably expected: 1. A longer forward reach of the flame at each manifestation of explosive combustion. 2. A concussion wave of greater force preceding the flame. These changes in effects, however, do not change the process of propagation. At each manifestation of explosive combustion the concussion wave again forces the air and dust beyond the reach of the flame and the latter halts and recedes because its air and fuel supply is momentarily cut off. The partial vacuum formed in front and about the flame is still of sufficient force to cause a counter-current to set in, which brings again into contact with the flame the air and fuel required for its propagation. The range of this counter-current is probably shorter and its action quicker and more powerful. The intervals between successive "halts" and "spurts" of the flame, instead of lasting sometimes several seconds, according to Dr. Wheeler's observations, are now of such short duration that neither these nor the action of the counter-current can be distinguished by the human eye.

Influence of the Condition of the Air Factor

In view of the above it appears that the condition of the air factor, considered both in a physical and chemical sense, is of much greater importance and influence in starting and propagating explosive combustion than the condition of the suspended dust. Much stress has been laid on the necessity of dust suspension in order to produce explosive effects, yet in many tests where the dust was in suspension above the flame explosive combustion failed to develop, while in other tests made under the same surroundings, and employing the same kind of dust and the same means of ignition, explosive combustion was produced in every test without fail when the air and dust were forced into close contact with the flame by draft. The former tests furnish additional proof that explosive combustion is not effected by conductivity or radiation, while the latter tests give further evidence that draft action determines explosive combustion and controls its magnitude.

The Illinois Coal-Mine Investigations

If the investigations made by the Bureau of Mines in Illinois had been of broader scope and due consideration had been given not only to the effects of seasonal changes on the state of the dust in mines, but also to the effects of these changes on air and draft conditions affecting the initiation, propagation and intensity of dust combustion, perhaps a different conclusion would have been reached regarding the cause of the persistent occurrence of explosions in that state during cold weather than the conclusion presented in *Bulletin* 83. Ample proof could have been found in Illinois to show that the state of the dust is not the all-important thing.

At the Waukegan starch works three very violent and disastrous dust explosions have occurred during a period of ten years. Like mine explosions, all have occurred during cold weather—two in February and one in the latter part of November. The fact is shown that the state of the dust in the starch works was not appreciably affected by seasonal influences and remained substantially in the same state of dryness the year round. Under the circumstances the explanation given in *Bulletin* 83 that the difference in dust conditions accounts for the persistent occurrence of explosions in Illinois in winter and for their equally persistent absence in summer can have no application in the Waukegan case.

If the fact is accepted that draft-action determines the magnitude of explosive combustion, then we have an explanation that will account satisfactorily for the marked prevalence of dust explosions in winter, irrespective of the fact whether they occurred in a mill, a mine or any other place; because it is a matter of common knowledge that air conditions and draft-action are much more favorable and effective for inciting and hastening combustion in winter than in summer. Many years ago Peckham and Peck, after investigating the Minneapolis mills explosion, called attention to the danger of a draft carrying dust and proved that draft was essential in producing explosive combustion.

Explosion in a Newly Opened Drift Mine

Richard Newsam told of an explosion that occurred in Illinois, Jan. 31, 1907, in a newly opened mine drift. The distance from the drift mouth to the face where the shot was fired was 103 yd., and the drift was wet the entire distance, the water dripping from the roof. There was no gas and no dry dust. The flame extended through the entire length of the entry and 20 ft. beyond the opening. What proof can be found in the conditions surrounding this explosion to support the claim that the dryness of the dust was the principal cause of all dust explosions in Illinois? The explosion occurred in midwinter, air conditions and draft-action were especially favorable and effective in supporting explosive combustion and the Eskmeals tests proved the presence in that drift of strong inrushes of air or counter-currents that stirred up the wet dust and brought it in contact with the flame.

The Royalton Mine Explosion

The explosion in the Royalton mine occurred on Oct. 27, 1914, about 7:25 a.m. It is supposed that the explosion was primarily caused by the ignition of a body of gas, but there appears to be no definite proof to that effect. Regarding dust conditions it is stated that there was but little dust and that the requirements of the Illinois mining law with regard to dampening the dust had been carried out. Regarding weather conditions Oscar Cartlidge, manager of the Springfield mine-rescue station, makes the following statement, Coal Age, Jan. 16, p. 116:

> The barometer at Royalton, at 7:30 a.m., registered as follows, the readings being corrected to a sea-level basis: Oct. 26, 29.98 in.: Oct. 27, 30.42 in.; Oct. 28, 30.15 in. This indicates a rise of 0.44 in. in the 24 hr. preceding the explosion.

Another report stated, "The morning was particularly cold and windy."

Considering briefly the effect of weather conditions in the Royalton mine we find that, as the weight of the oxygen content of a cubic foot of air increases proportionately to the decrease in the absolute temperature of the air, a given space in the mine could contain a greater number of pounds of oxygen for the support of combustion in winter than in summer, and with the same number of revolutions of the fan per minute a materially larger quantity of air would be passing through the mine on a cold than on a hot day.

Influence of Outside Temperature to Facilitate Explosion

The effects of temperature on the manner of the flow of air in a mine are very marked. If the men in charge of the Royalton mine will select a place on the intake, say ¼ mile inby from the downcast shaft, and measure at convenient intervals the velocities of the air current at points near the roof and near the floor, they will find that with the outside temperature higher than that in the mine the velocity of the air will be greater at the roof than at the floor. Again, with the outside temperature below that of the mine it will be found that the reverse of this is true and that the greater the difference of temperature the greater will be the difference in these velocities.

This fact is important, because explosive combustion is determined in a large degree by the manner of the draft-action that brings the air and dust into contact with the flame. A noticeable difference is observed in the flame of a safety lamp when the air supply enters the lamp above instead of below the flame. In the mine the stronger dust-carrying draft near the floor, in winter, is most effective in producing explosive combustion as it impinges on the flame. The truth of this has been proved in a number of tests.

Effect of Barometric Changes

The fact that the barometer indicated a rise of nearly ½ in. in the 24 hr. preceding the Royalton explosion is rather important. An increase in atmospheric pressure is generally considered a protection against the occurrence of a gas explosion to the extent that it tends to diminish the outflow of gas from the strata, but considered in respect to the occurrence of a dust explosion a rising barometer should be looked upon as a sign of danger. The rise of the barometer at Royalton of nearly ½ in.

indicated that the weight of the oxygen content of that mine was increased about 1½ per cent.

At my place of residence in Iowa a sudden drop in temperature was noted during the night of Oct. 26, and a similar sharp change in temperature probably occurred at Royalton, for it was stated that the morning of Oct. 27 was "particularly cold and windy." Supposing this sudden change in weather conditions had the effect of lowering the mine temperature, say 5 deg., the weight of the oxygen content of the mine would then have been increased another 1 per cent. Now, if the presence of less than 1 per cent. of methane tends to increase the magnitude of dust ignition, surely an increase of more than 2 per cent. in the weight of oxygen per cubic foot of air cannot be without effect in the same respect. The French advice regarding the unraveling of mysterious social happenings is, "Look for the woman." The advice regarding the explanation of mystifying phenomena in connection with dust explosions might well be, Look to the air factor.

Position of Cannon in Testing Gallery

The British Explosions in Mines Committee stated that by placing the cannon 50 ft. *from* the closed end of the gallery better effects could be obtained than by placing the cannon right *at* the closed end; but the committee offered no explanation regarding the cause of the difference in these effects. Following this suggested advice we find that in the former case the air supply furnished by the counter-current could reach the flame from one direction and through one channel only. The supply of air being somewhat limited on that account, the initiation of explosive combustion was comparatively slow and uncertain. When the cannon was 50 ft. away from the face explosive combustion was more readily effected and of larger scope, because in addition to the air supply by the counter-current there was another air supply from the rear caused by the rebound of the momentarily compressed air between the cannon and the closed end of the gallery.

The Bruceton Mine-Explosion Tests

A number of so-called "preliminary tests" made in the Bruceton experimental mine failed to produce explosive combustion, although the kind, amount and disposition of the dust charge and the powder charge were the same as in other experiments in that mine that resulted in explosions. Apparently no attempt was made to locate the cause of the failures, and the matter was disposed of with the assumption that the range of dust suspension had probably not been extensive enough. Why should the investigators at Bruceton be satisfied with assumptions when they have the best facilities in the world to obtain conclusive proof? They could have controlled the extent of dust suspension as readily as they did control the firing of the shot. Had they done so, they would probably have found that the cause of the failures was not the insufficiency of dust suspension, but, as further investigation might have shown, the cause was probably insufficient draft and a counter-current that was too weak to propagate explosive combustion.

It has been said that the fact of the existence of a counter-current during the progress of explosion is of no practical value in supplying means for its prevention. Possibly this is true; but, nevertheless, the success of patented devices, as the Rice barrier for instance, depends on the action of the counter-current to drive the solid or liquid extinguishing material against and into the flame. The proof of the existence of the counter-current permits us to develop definitely and accurately the process of propagation of explosive combustion, and in that fact lies its greatest value, for it has been admitted that accurate knowledge of that process is essential in devising the right means of prevention.

More than three years ago the chief mining engineer of the Bureau of Mines made the following statement: "The principal object at the present time is to determine how and why coal dust explodes, in order that means of prevention and limitation may be suggested from the experiments, and be tried out subsequently." Surely, in the time that has elapsed some progress must have been made in this direction. If the process of explosive combustion has been discovered at Bruceton it should be made public without delay; if it has not been discovered it would be interesting to know what obstacles are in the way.

The general recognition of the fact that air and draft conditions largely control the initiation and propagation of explosive combustion will prove to be of greater value in preventing dust explosions than the application of any artificial remedy so far proposed, because the knowledge of the preponderating influence of the air factor will permit the men in charge of mills and mines to note the danger signs which, before having that knowledge, they were unable to see, and they will thus be better prepared to avert a threatening disaster.

⁂

Kentucky Mining Institute

Several hundred of the leading coal operators of Kentucky were present in Pineville, Ky., on Friday and Saturday, May 14 and 15, at the first-aid field day and annual meeting of the Kentucky Mining Institute.

Much of the first day was devoted to field demonstrations, and about 250 of the early arrivals took an all-day jaunt through the fields of Bell and Harlan Counties. They inspected the plants and workings, stopping at Coxton, Ky., for lunch, where Kenneth U. Meguire, of Louisville, president of the Harlan Coal Mining Co., and John W. Williams, of Harlan, representing the Lick Branch Coal Co., were hosts.

Among the principal speakers were Frank H. Cassell, sales director of the Belknap Hardware & Manufacturing Co., of Louisville, who spoke on "The Growth of the Coal Industry in Eastern Kentucky and What This Means to Louisville Commercial and Manufacturing Interests," and William J. von Borries, who spoke on "The Coal Fields of Perry County." Other papers were: "Good Roads Legislation and Its Effects on Southeastern Kentucky," by Jos. F. Bosworth, Middlesboro, Ky.; "The Coals of Eastern Kentucky," by Frank Haas, Fairmont, W. Va.; "The Goodman Straight-Face Mining Machine," by H. H. Small, Chicago, Ill.; "The Coal Fields of Harlan County," by Walter R. Peck, Big Stone Gap, Va.

⁂

A great deal of unnecessary wear in working parts of machinery could be avoided if the nature and application of lubricants were properly studied. Too much oil should never be used, and it should be the special care of the workman to see that it is uniformly distributed and regularly applied. One dry spot on a bearing causes heat, and cutting is bound to follow.

Driving Gangways in Anthracite Mines by Improved Method

By Charles C. Phelps*

SYNOPSIS—The substitution of electrically driven mine-car compressors and Jackhamer drills for drilling both coal and rock in place of hand augers and rock drills resulted in greater speed of driving as well as the saving of considerable time.

This article refers to the results obtained in mining anthracite coal by the use of Jackhamers and electrically driven mine-car compressors by one of the large coal-mining companies operating in the Scranton district of Pennsylvania. One of the collieries of this company was recently visited by the writer after the above-named equipment had been in service about seven months.

The mine-car compressors here employed are of the Ingersoll-Rand type, as described in the Dec. 12, 1914, issue of Coal Age, and the Jackhamers are of the Ingersoll-Rand "BCR-430" type, as described in the Apr. 3 and other issues. It will not be necessary, therefore, to go into a detailed description of either machine. A large number of these equipments are in use in the various mines of this company for drilling both coal and rock, also for cutting hitches for timbers.

Formerly hand coal augers were used for boring the coal, while Temple-Ingersoll electric-air drills as well as hammer and "jumper" steel were employed for the rock. Whereas two men were required for either machine or hand drilling, as formerly practiced at this mine, it now requires but one man to run a Jackhamer drill, as this machine is easy to operate and, owing to its lightness, may be moved from place to place almost as easily as a shovel or pick.

One feature of the Jackhamer that is particularly appreciated by the drill runner is the improvement in the ventilation at the face due to the air exhausting from the drill.

Although some of the holes are drilled downward, most of them are projected horizontally for blasting from the solid. Probably three out of every four holes are horizontal. The blast holes are drilled to a depth of 6 ft. with changes of steel varying by a foot. A set comprises lengths of 2½, 3½, 4½, 5½ and 6½ ft. of hollow hexagon steel with cross-bits of such size that the bottoming diameter permits of charging with ⅞-in. 50-per cent. gelatin powder. Holes were formerly put in to the same depth and the same strength powder was used, but the holes were of 1½ in. diameter.

With conditions as mentioned above, the rate of progress during one month was 225 ft. of gangway driven, working with one Jackhamer during two 8-hr. shifts per day and driving a section 14 ft. wide comprising 3 ft. of anthracite coal and 4 ft. of bottom sand-rock. The rate of drilling of the Jackhamer in hard coal was observed to be 3 min. for a 6-ft. hole, including changes of steel. It required 10 min. to drill a 6-ft. hole in the sand rock, also including the changing of steel.

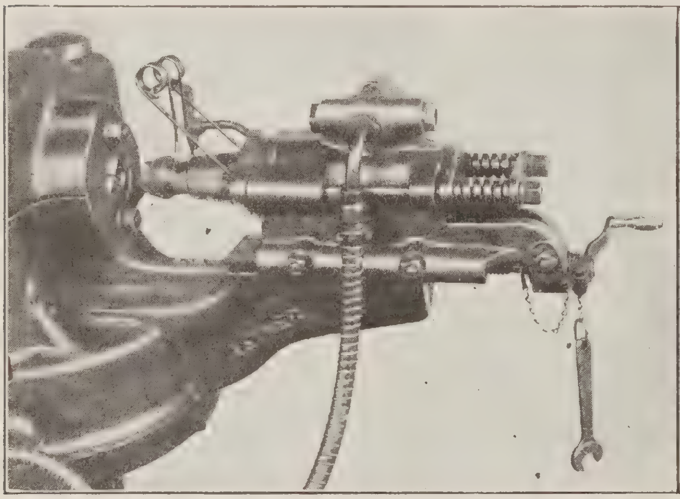


Fig. 1. The Dolly Sharpening a Drill Point

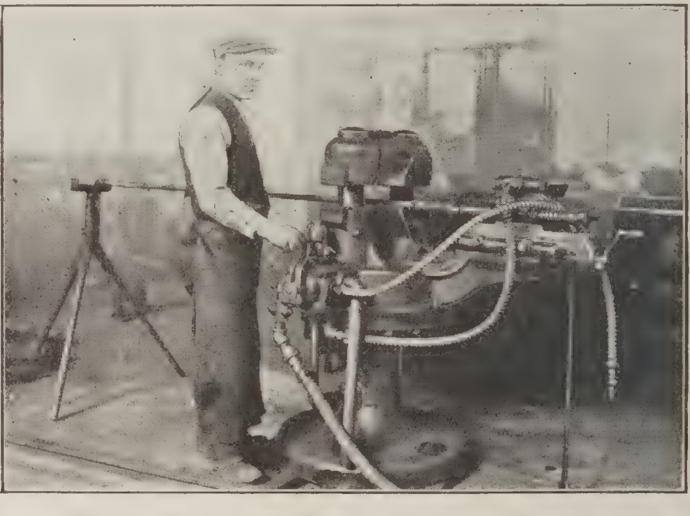

Fig. 2. General View of Leyner Sharpener

The mine-car compressor is transported over the regular mine tracks to a point near the face. It is then derailed and placed to one side and connected with the electric line supplying the trolley system. The drill-runner also cares for the mine-car compressor, no other attendant being required. In fact, about the only attention required by the compressor is an occasional filling of the water jacket, which is of the hopper reservoir type, and replenishment of lubricating oil. In other respects the compressor is entirely automatic in action, an automatic unloader keeping the pressure in the receiver at approximately 100 lb.

The 25-hp. motor which drives this compressor is started and stopped with an automatic motor starter, which is a new development, as hand-operated starters have been employed previously for starting machines in this service. The hand starter has the shortcoming that it depends for successful operation upon a certain amount

---

*Ingersoll-Rand Co., 11 Broadway, New York City.

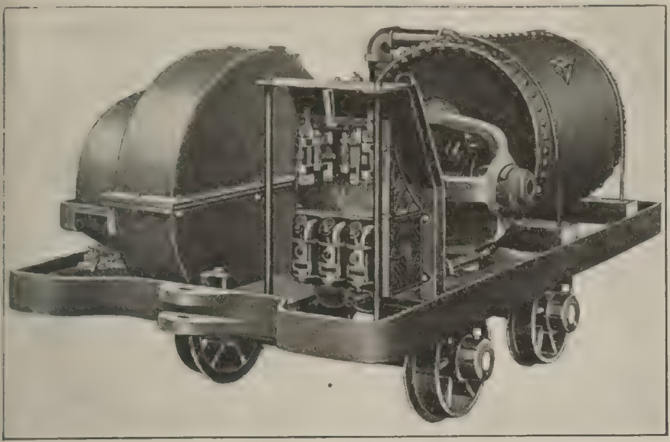

FIG. 3. THE MINE-CAR COMPRESSOR, SHOWING THE AUTOMATIC STARTER

of skill on the part of the operator, and as these equipments are often handled by inexperienced men, it is difficult to prevent abusing the motor when the hand type of starter is employed. With the automatic starter, the knife switch is closed in order to start up, whereupon the motor is smoothly but quickly accelerated to maximum speed. The knife switch is opened when the compressor is to be shut down.

The automatic motor starter may be seen in Fig. 3 showing the compressor car. It is known as a form AK made by the Electric Controller & Manufacturing Co. The copper contacts are protected by dirt-proof covers, which also help to exclude the corrosive gases that are present in coal mines. On account of the extremely wide range of voltage found in the average mine these starters are specially designed to keep the motor across the line, even when the voltage drops to a very low figure. An added advantage of using automatic starters lies in the fact that if power is interrupted the motor will be gradually restarted without further attention when current is again restored.

The steels used while making the observations referred to were sharpened by hand. Since that time several Leyner drill sharpeners have been purchased for the company's various mines. One of these is shown in Fig. 2. Three coal forges located near the sharpener are used for heating the steels. The bit is first inserted between the forming blocks, and the heavy cross-head forges the bit to approximate cross-section. It is then inserted in the dies in the center of the machine and the cross-head is lowered to grip the steel tightly. The dolly then reciprocates rapidly, striking the end of the bit a succession of light blows, compacting the metal and sharpening the bit.

FIG. 4. STARTING A HOLE

The sharpener is operated by compressed air, and its action is controlled entirely by the single lever shown in the illustration. After sharpening, the steel is reheated to a cherry red and hardened by dipping in a pail of water upon the surface of which floats about ½ in. of crude oil. The shanks are formed in the same machine and are hardened for a distance of about ¼ in. from the end.

By means of the Leyner sharpener the time required for sharpening steel is greatly decreased, giving the blacksmith more time for other duties. At the same time a much better and more uniform quality of work is obtained. The method of hardening described has proven satisfactory, resulting in very little broken steel.

⁂

Decrease in Coal Production

Production of coal in the 24th bituminous district of Pennsylvania in 1914, as compared with production in the same district for 1913, is given by Nicholas Evans, inspector, as follows:

Names of Operators	Tons, 1913	Tons, 1914
Berwind-White Coal Mining Co.	3,841,715	3,351,406
Valley Smokeless Coal Co.	416,261	286,835

C. E. Lesher Succeeds Mr. Parker

C. E. Lesher, associate geologist of the land-classification board of the United States Geological Survey, has been assigned by the director of the Survey to take charge of the work of compiling the statistics of coal production published in the annual volume, "Mineral Resources." This work has heretofore been directly under Edward W. Parker, whose resignation from the Geological Survey is effective July 1.

Mr. Lesher is a graduate of the Colorado School of Mines, and after his graduation was engaged in mining in British Columbia until 1910, when he went to the United States Geological Survey. Since then as a field geologist he has had experience in the coal fields of Montana, Colorado, Wyoming, North Dakota, Washington and Oregon. As a member of the land-classification board, his largest contribution has been in perfecting the scheme for the valuation of the public coal lands, in which it has been necessary to utilize a large amount of statistical data of various types.

Small Steam Turbines at Coal-Mine Power Plants

By R. M. Rush*

SYNOPSIS—Cost of power production at coal mines is seldom known accurately, with the result that machinery has often been installed which was highly extravagant in steam consumption. The steam turbine possesses many advantages over reciprocating engines where condensing water can be secured. In many instances mine water may be used for this purpose with excellent results.

The cost of producing power for the operation of coal mines has long been an unknown quantity with the average coal operator. He has felt that inasmuch as coal is cheap to him, a producer, the matter of power cost made little difference, and hence the class of apparatus used for power production was in many cases of the poorest type as regards economy.

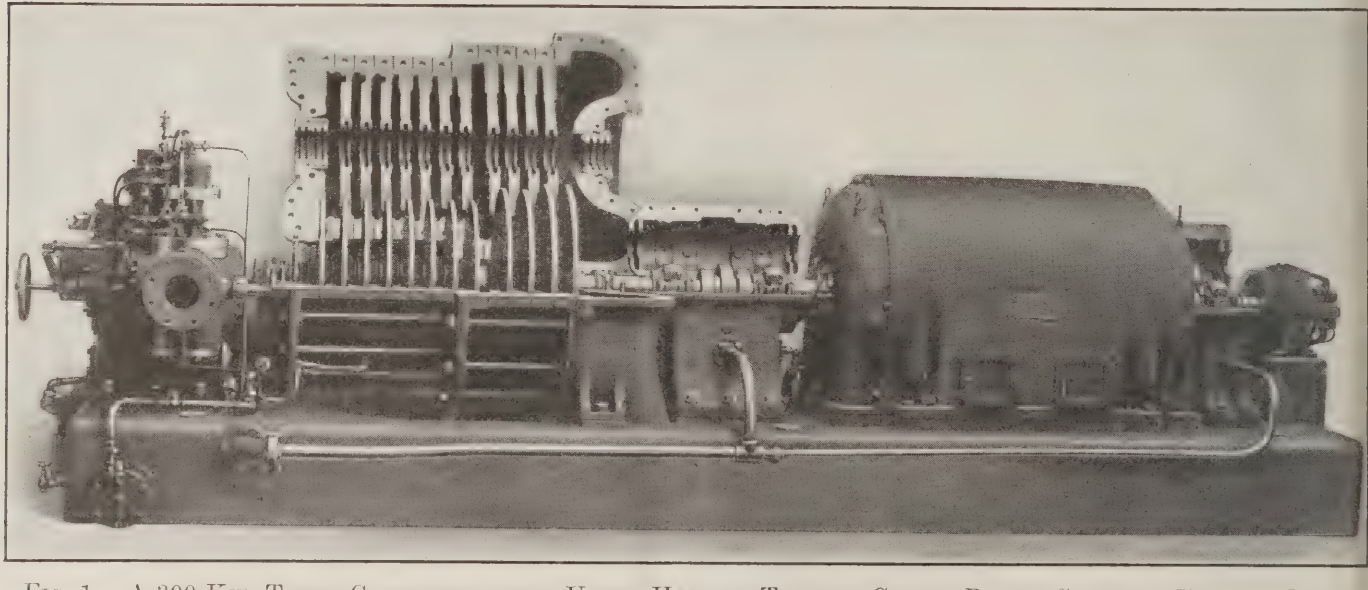

Fig. 1. A 300-Kw. Turbo-Generator with Upper Half of Turbine Casing Raised Showing Turbine Disks

Fire-tube boilers hand-fired and carrying low steam pressure and driving simple noncondensing engines were employed in nearly every instance. Often feed-water heaters were not employed. The question of reliability alone concerned the operator. With this state of affairs central-station power, generated by efficient condensing steam turbines with high-pressure boilers and automatic stokers, was usually able to show a saving over the inefficient noncondensing engine, and many coal operators adopted central-station power regardless of their own cheap fuel.

Owing to local conditions such as exceedingly bad boiler feed and a lack of condensing water, central-station power is often better for the producer than operating his own plant, but to compare this source of energy with inefficient apparatus is manifestly unfair.

With the advent of the small steam turbine the situation has been largely changed. A comparison of a modern, uptodate condensing turbine plant for operatio of a mine with the purchase of central-station power i nearly every instance is found to favor the local plant provided condensing water is available. It is the purpos of this article to tell of some interesting installations i coal mines where small steam turbines have bee employed; that is, turbines below 500 kw. that have bee installed for the economic generation of electric current

Fig. 1 is a photograph of one of two 300-kw. high-pressure condensing turbo-generators installed at th plant of W. J. Rainey, at Allison, Penn. These machine are designed for a steam pressure of 125 lb. and for 27 in. of vacuum, under which conditions the guarantee steam consumption per kilowatt-hour is about 22 lb Condensers of the barometric type are installed. These were guaranteed to produce 27 in. of vacuum, but were of such ample size that the vacuum actually obtained was approximately 29 in. all the time. This reduced the steam consumption of the turbine to about 20½ lb. per kw.-hr., or approximately 15 lb. per brake hp. per hr.

This compares favorably with the average noncondensing engine, the consumption of which is from 26 to 35 lb. per i.hp. per hr. The load curve of a steam turbine, furthermore, is practically flat, since the entire rotor revolves in a vacuum during periods of light load. A noncondensing engine, however, nearly doubles its steam consumption per brake horsepower-hour at light load. A coal-mine load is always fluctuating, and this fact alone places the steam turbine far ahead of the reciprocating engine for coal-mine service.

A Turbine Has Many Advantages

There are numerous other advantages possessed by uptodate steam turbines over the old-fashioned steam engines. A turbine requires no cylinder oil. This in itself is a considerable saving, but it also means that the

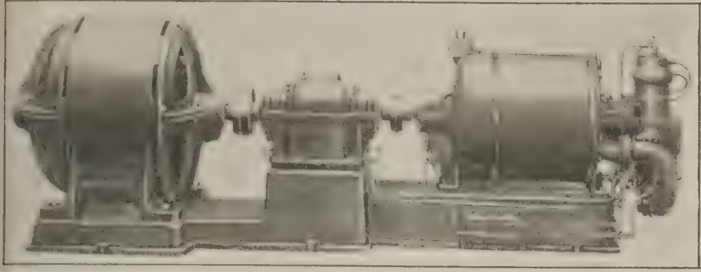

Fig. 2. A 200-Kw. 550-Volt D. C. Turbo-Generator for 2-Lb. Inlet Pressure and 27 In. of Vacuum

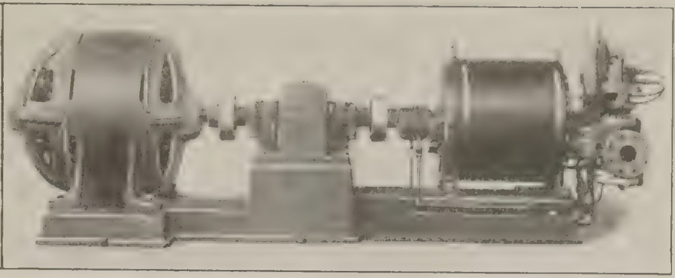

Fig. 3. A 75-Kw., Geared Generating Unit Installed near Brownsville, Penn.

condensate can be returned to the boilers free from oil and that oil is eliminated in the feed-water heater. The repairs on a steam turbine are considerably less than on a steam engine for the reason that there are no rubbing parts in the turbine. Oil under pressure is circulated to the bearings, cooled and recirculated, so that often a barrel of lubricant will last for a year. Leakage loss alone renders oil renewal necessary.

The question of a condenser for the production of vacuum has been a bugaboo to the average coal operator. At the plant of W. J. Rainey, referred to, the water for condensing purposes is typical of the average coal mine. It is highly impregnated with sulphuric acid and utterly unfit for boiler feeding, yet with the type of condenser employed there has been no trouble whatever with this part of the equipment. The barometric condensers here installed are constructed with the distributing cones made of monel metal, which is highly acid-resisting. Water flows through the condenser at a low velocity, so that erosion is practically negligible.

The pumps which supply the water to the condensers are made of acid-resisting bronze. They are of the double-suction centrifugal type. The head is comparatively low, so that wear on the pumps is slight. The water discharges from the condenser by gravity, so that there is no withdrawal pump to deteriorate as is the case with the low-head jet condenser.

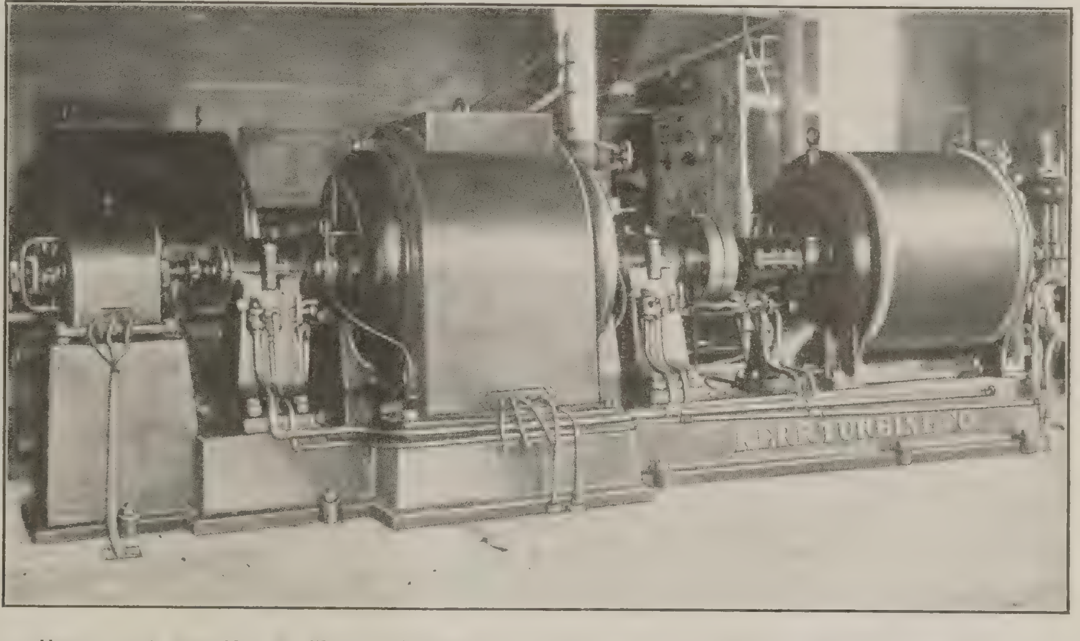

Fig. 4. A 625-Kv.-A. Turbo-Alternator Installed at North Kemmerer, Wyo.

In this plant, as stated, the water conditions are about as bad as exist at any mine, yet the vacuum obtained is from 28 to 29 in., and everything points to freedom from trouble owing to acid. At this plant water for the boiler feed is obtained from a reservoir in the hills, so that there is no need of returning the condensate to the boilers, and hence a surface condenser was not considered in this installation.

A Low-Pressure Turbine and Condensing Plant

At another plant in the same vicinity, water for boiler feed is not readily available. At this plant, there are a number of noncondensing engines in operation, and an extension is planned which requires doubling the electrical equipment. This could be obtained by the installation of noncondensing engines and more boilers, but it is proposed to gather the exhaust steam from the existing noncondensing generator engines, from the fan engine, the hoist engine and the pumps into a main header and use this in a low-pressure steam turbine. There is sufficient exhaust steam to double the present electrical output without additional boiler equipment.

As has been stated, considerable trouble has been caused in the boilers owing to bad feed water, and hence it is proposed to install a condenser of the surface type large enough to condense all the steam at this plant and return it as pure distilled water to the boilers. This means that a condenser with copper tubes properly tinned to resist corrosion must be installed. All the steam that is needed will be utilized through the exhaust turbines, the remainder flowing through a special valve around the machine into the condenser. This installation, therefore, will double the present power output with the same coal consumption and eliminate boiler trouble.

At the plant of the Westmoreland Coal Co. a somewhat similar installation has been made except that a condenser of the jet type was used. Water from the mine pumps highly impregnated with acid is discharged to a cast-iron standpipe made up of old pump cylinders, overflowing this to a jet condenser. In this plant 200 kw. of power was produced from exhaust steam, and it was possible to shut down two high-pressure boilers with a resultant large saving in coal. This condenser worked out satisfactorily, except for the fact that the high water velocity through the nozzles caused considerable erosion and corrosion.

Additional installations are now being made in which the barometric type of condenser will be employed. The lower water velocities of these condensers will probably eliminate corrosive troubles. The condensers will be wood lined so that the acid water cannot come in contact with the metal of which the condenser is made.

The fact that power can be produced from exhaust steam is one which is often overlooked by coal operators. The only thing necessary is a sufficient supply of condensing water, and when this can be obtained from the mine water (which has to be pumped away anyway), it is a decided mistake to continue installing high-pressure boilers and noncondensing engines for increased power requirements.

The reliability of present-day steam turbines is evidenced by their continued purchase after initial installation. For instance, the Kemmerer Coal Co., North Kemmerer, Wyo., installed in 1910 a 150-kw. turbo-alternator, built by the Kerr Turbine Co., Wellsville, N. Y. In 1911 a 250-kw. unit was purchased, while in 1913 a 625-kv.-a. machine was also purchased.

⁂

Extracts from a Superintendent's Diary

The curse of gold—it shows its color even in a mining town. To-day the county sheriff came into our camp with a warrant calling for the arrest of John Stewart, and as he left with John Stewart in his custody probably not a man, woman or child in the camp resented his mission. And yet not more than three years ago John Stewart was one of the most popular young men of our community and his popularity was merited.

John came into our camp about five years ago. He had been employed in our company's general office as an accountant and was sent out to take a check clerk's place temporarily. The temporary position developed into a permanent one because the check clerk finally died and John accepted the vacancy.

Being city bred he was surprised at the way our citizens allowed their earnings to slip through their fingers and how then in a few days they would agree to any kind of terms in order to obtain small loans necessary to tide them over until the next payday.

In time the novelty of seeing men pour their earnings into a sieve, as it were, wore away, and one day John awoke to the fact that here were wonderful possibilities. He got his cue from a young fellow who came up to the check window to draw a check, but had to be refused because his earnings had been overdrawn. The man begged John to make him a small loan and volunteered to repay at the rate of two for one on the following payday. John hesitated but recalling that this was done every day, finally consented. After that he hesitated less and less, and in a few months his slight capital suggested astonishing possibilities.

Soon he got to a point where he not only took all loans offered, but even suggested them, and then in a short time he began to invent ways and means of encouraging his associates' extravagances, having in mind the inevitable personal profit that would result. And during all this time he was well within the law, was popular with most of his associates and was considered a valuable employee by his superiors.

One must question if he could tell when he began to have fear for the law or found it necessary to doubt the sincerity of his associates, but once fully convinced that such was the case he became a changed man and his easy temper and suavity gave way to austerity and moroseness.

Then it was that the lust for gold became a matter of life and death with him, and one by one all of the ties that bound him to friends and to ideals were loosed by the vision that had intoxicated his brain. When the inevitable crash did come, he was left dazed and friendless like a lone survivor from a wrecked ship.

The men who induced him to try his luck on the stock exchange were indirectly responsible for his downfall, since he tried to cover his losses there by a forgery, but they never saw him and are entirely ignorant of his fate. Often, no doubt, he will curse them mightily, and he in turn will be denounced just as often by the victims he left behind in our camp. But it is doubtful if he or a single one of his victims will associate his undoing with the chance opportunity that overcame his prejudice against usury and seemed to offer the way to riches.

If I keep on moralizing, I'll have to take up preaching.

⁂

Decreased Receipts of Coal in Brazil

From a steadily increasing importation of coal through a period of years prior to 1914 there was a marked decline during last year, or a total importation to the value of $12,209,561 as compared with $19,505,066 in 1913, says Consul General A. L. M. Gottschalk in a supplement to *Commerce Reports*. The coal trade of Brazil is shared between Great Britain and the United States, and although Great Britain still furnishes by far the bulk of the local supply ($16,670,780, or 85 per cent. of the total in 1913), the receipts of Cardiff and Newcastle coal declined in 1914 to $9,950,795, while the imports from the United States (chiefly Pocahontas) increased to $2,242,651 in 1914 as compared with $2,162,098 the preceding year.

The gradual introduction of oil (and in some cases wood) fuel in some of the Brazilian railroads met the scarcity of coal here brought about by embargoes, scarcity of bottoms and the high freight and insurance rates of the war. But there is here an important market in which American exporters should have a greater share during the present stringency.

⁂

Record Haul with One Mule

On May 18, 1915, Lindsey Shorts, a mule driver in No. 4 mine of the West Virginia-Pittsburgh Coal Co., Wellsburgh, W. Va., gathered 152 cars of coal and rock with a single mule from the rooms and entries and delivered them to a parting.

The minimum distance on this haul was 1200 ft. and the maximum distance 2500 ft. The cars were of 2-ton capacity and were hauled in an 8-hr. day. In this district about 40 to 50 cars are considered a day's work for a single mule; the haulage of 152 cars is the best I have ever seen during this time.

Clamp for Blueprint Frame

F. J. Hibberd in the *American Machinist* describes a clamp for blueprint frames for use in those drafting-rooms where the electric blueprinting machine has not been introduced, but where the old-style sun frame still exists. There are many devices used for clamping the pressure board down on the back of the frame so as to give the necessary close contact between the tracing and the glass. The common door-bolt, which is the device generally used, is a most unsatisfactory means of securing this contact.

The illustration shows an improved method. It is composed of a brass bracket *A,* which is fastened by screws to the side of the frame. It has a sliding piece *B,* which can be moved in and out by hand like a "bolt" and is so designated in the illustration.

DETAILS OF BLUEPRINT CLAMP

Underneath this bolt is an eccentric disk *C,* which is fastened to a pin and has a hand lever fitted in its square end. When the bolt is shot into place, the lever is pulled over to the right, as shown by the dotted lines, and the eccentric disk forces the bolt up in the direction of the pressure board, thereby pressing the tracing against the glass of the frame. There are pegs, *D* and *E,* to limit the movement of the bolt. Of course in actual use the whole appliance is reversed and so remains till the clamping is complete.

⁂

A Practical and Convenient Mine Stopping

By Ralph W. Mayer*

A mine in which the pillars are taking weight from the overburden is likely to have its concrete stoppings crushed or cracked, rendering them worthless.

Squared timbers cut about 2 ft. long and of any convenient dimensions, usually about 4 in. square, stacked up like brick lengthwise with the crosscut and with a little sand or cement laid between the blocks, make a stopping that becomes more compact the tighter it is crushed together by the weight of the overburden. Burlap or calking and wedges should be tightly driven between the blocks and the ribs and roof.

Props which have been pulled out of the gob and which are too short to be used a second time in the rooms can be utilized instead of the squared timbers, piling them like cordwood in the crosscut, with sand or cement between them, and tightly wedging them in place. A coating of cement or mortar over the end of the stopping will prevent air from leaking through any small cracks which may exist before the timbers and sand get crushed together.

Forty-penny spikes driven into the ends of the props or squared timbers before the cement is applied will help to hold the coating of cement from falling off.

A stopping which may possibly be exposed to the heat of a mine fire and the crushing weight of the overburden and is to be built in a wide opening such as an entry can be built double. The inside stopping is made of 1x12-in. boards nailed to props wedged between the floor and roof.

The outside stopping is set back in the entry 6 to 10 ft. from the inside stopping, the distance depending upon the height of the coal seam. It is built of 12x12-in. squared timbers laid across the entry and walled up one on top of the other. Hitches or channels are cut in the floor, roof and ribs to receive the timbers. A thin layer of cement or mortar is put between the timbers and at all the joints.

The space between the two stoppings is packed tight with fine dirt as the outside stopping is built up, extra care being taken to pack the dirt tight up against the roof before the outside stopping is sealed. A coating of cement or mortar is spread over the surface of the outside stopping to close any leaks of air that might possibly exist.

Summer Meeting of the Rocky Mountain Coal Mining Institute

The summer meeting of the Rocky Mountain Coal Mining Institute will be held June 8-10 at Trinidad, Colo. E. H. Weitzel is president and F. W. Whiteside is secretary-treasurer. The committee on arrangements, consisting of W. F. Murray, J. P. Thomas and M. O. Danford, has prepared the following program:

June 8, Tuesday—10 a.m., opening at West Opera House; music; address of welcome by Mayor D. L. Taylor; addresses by leading citizens; music; regular order of business; obituary of deceased members. 2 p.m., paper on "Geology of Trinidad Coal Field," by R. C. Hills; discussion of paper. 8 p.m., moving-picture show at West Opera House, consisting of five reels of pictures from the Bureau of Mines.

June 9, Wednesday—7:30 a.m., special train leaving Santa Fé depot on the Colorado & Wyoming R.R. for Cokedale, Segundo, Primero and other points of interest; box picnic at Tercio. Prize contest in the evening, under the auspices of the Eagles.

June 10, Thursday—9:30 a.m., opening meeting at West Opera House; music; paper on "Use of Electric Safety Lamps," by A. L. Thompson; discussion of paper; paper on "Social Welfare Work," by David Griffiths; discussion of paper. 1:30 p.m., special train over Colorado & Southeastern R.R. to Ludlow, Hastings and Delagua. 9 p.m., banquet at Cardenas Hotel.

Special entertainment for the visiting ladies has been provided as follows:

June 8, Tuesday—2 p.m., reception and cards at the Country Club. 9:30 p.m., after the picture show there will be an open-house reception and dance in the ballroom under the West Opera House; refreshments will be served.

June 9, Wednesday—Special trip to Tercio; interesting contest at night.

June 10, Thursday—9 a.m., automobile trip to top of Raton Pass, where lunch will be served. 1:30 p.m., special trip to Ludlow, Hastings and Delagua. 9 p.m., banquet, cards and dancing at the Masonic Temple reception rooms.

The Labor Situation

SYNOPSIS—The examinations of John D. Rockefeller, Jr., L. M. Bowers, E. S. Gaddis and D. S. McCorkle before the Industrial Relations Commission continue the interest in the Colorado situation.

Mother Jones appeared before the Industrial Relations Commission at Washington, D. C., on May 13 and told her story in her own way without any questions. It would be wrong to heckle anyone with so benign a past. Chairman Walsh found nothing to question. The difference between his attitude toward Mother Jones and J. D. Rockefeller, Jr., was clear evidence of his purpose to make political capital out of the investigation.

Her characteristic reply to the inquiry as to her place of residence is worth repeating: "I live wherever there is a good fight against wrong. I live wherever the workers are fighting the robbers." She was allowed to reveal a selected part of her past, and even went back to 1877, when she aided in the Pennsylvania R.R. strike.

Two Employees, on Dismissal, Condemn the Fuel Company

Eugene S. Gaddis, a Methodist minister, testified on May 19 that he had been in the employ of the Colorado Fuel & Iron Co as sociological superintendent. He said he was dismissed last February because he and a superior official of the company were not in accord, and he had called to the attention of John D. Rockefeller, Jr., and the officials of the company many abuses and conditions of hardship of which the miners complained.

He said he had not informed the public of the injustices because he believed that only by silence could he do good in his work. He declared that the state authorities did not enforce the laws and that the company dominated politics, the justices of the peace being usually company employees. The company controlled the schools and churches, and by systematic oppression drove the men to strike in self-defense.

R. S. McCorkle, a Presbyterian officiating at the Sunrise, Wyo., church, of which we illustrated the interior and exterior in our issue of May 15, stated that he was instructed not to inform the employees that the company maintained the church. He stated that he urged that this be made public. It must have been a profound secret known to 99 per cent. and surmised by the other 1 per cent. His sympathies were with the strikers. When asked why the miners bought guns 10 days before the strike, he declared that the company at that time had supplied itself with machine guns.

Chairman Walsh Is Subjected to Censure

When on the following day John D. Rockefeller, Jr., was examined, the inquiries of Frank P. Walsh were so vindictive that it is alleged his fellow-commissioners privately took him to task. Mr. Rockefeller's remarks mostly declared his lack of knowledge of the facts relating to the Colorado trouble. He stated that he had been intending to visit the mines, but unforeseen business duties prevented.

The chairman strenuously endeavored to have Mr. Rockefeller promise to do certain things, some of which were unlawful, if he thought, on investigation, that injustice had been done to J. R. Lawson. Mr. Rockefeller declared that the company had taken no part in securing Lawson's conviction for murder and that he did not propose to try to overawe the courts.

L. N. Bowers, the treasurer of the company, declared that the strikers had been given an opportunity to meet the representatives of the operators; that the courts were not controlled by the coal companies; that the first violence occurred when the strikers killed a camp marshal; that Sheriff Jefferson Farr, "the king of Huerfano County," was at one time connected with the Colorado Fuel & Iron Co.—in fact, he was a part of it.

He admitted that in the early days an officer of the concern, now dead, organized a partnership between the company and Farr for the conduct of saloons in the mining camps, which were used as employment bureaus. Bowers declared he fought the system of which Farr was the head and that he favored state prohibition as a means of eliminating the control of politicians.

On May 24 the jury before which Robert Uhlich, a union leader, was tried for the murder of Mack Powell, a cowboy, returned a verdict of not guilty on the first ballot. The cowboy was killed during a fight between mine guards and striking coal miners near Ludlow Colo., on Oct. 9, 1913, during the Colorado coal strike. The evidence presented by the state endeavored to show that the Ludlow colonists were armed and led by Uhlich when Powell was killed by the striking coal miners, but seven witnesses swore that Uhlich was in Trinidad on the day of the battle.

Eastern Ohio Goes Back to Work

The representatives of the operators and miners in the eastern Ohio district met on May 22 and formally signed the wage agreement. The right of the pit committee to leave its work and investigate grievances at its pleasure gave trouble up to the last.

A number of plants in the eastern Ohio district have already resumed operations. They are mines Nos. 1 and 3 of the Rail & River Coal Co., the Crescent mine of the Lorain Coal & Dock Co., the mines of the Glenns Run Coal Co., the Morris-Poston Coal Co., the Hutchinson Coal Co. and the Youghiogheny & Ohio Coal Co.

The work of preparing the other mines for operation is progressing satisfactorily. According to J. M. Roan, the Ohio "mine inspector," most of the mines in the eastern Ohio district are in much better shape than might be expected after an idleness of 13 months.

The Gallagher Amendment Still Unsigned

It is announced that Governor Willis will have until May 27 either to approve or veto the Gallagher amendment to the Ohio anti-screen law which was passed by both houses of the Ohio Legislature. Labor leaders are urging the Governor to veto the amendment, while eastern Ohio operators are advocating its approval. The long time provided for the consideration of the bill is due to a technical error in clerical work, which required the amendment to be returned to the Senate for correction.

Announcement was made last week that 200 miners at the West Wheeling mine of the Lorain Coal & Dock Co. struck because of the employment of nonunion miners. The truth of the matter is that 17 men employed at the West Wheeling mine of the West Wheeling Coal Co., a coöperative concern, refused to work until certain men were discharged. The Lorain Coal & Dock Co. was not involved except as owner of the mine, which is operated by the West Wheeling Coal Co. under lease. The miners resent working with men who worked at nonunion mines during the strike.

Anthracite Button and Grievance Strikes

The anthracite region is troubled with small strikes. On May 19 at the Luke Fidler colliery of the Susquehanna Coal Co. 800 employees went on strike because some of the other men were not members of the union. On the same day strikes of the mine workers at Maxwell No. 20 colliery to secure the settlement of alleged grievances of two driver boys and at No. 4 slope of the Stanton colliery for the abolition of the new checking system were settled, but button strikes occurred at the Lance No. 11, Parrish and Hollenback collieries on that day. These mines all belong to the Lehigh & Wilkes-Barre Coal Co. The union is trying to hold the men to the terms of their agreement, which forbids strikes.

The Anthracite Conciliation Board on May 17 heard the grievances of the employees of the Lehigh Valley Coal Co. and of the workmen at the Shenandoah City colliery of the Philadelphia & Reading Coal & Iron Co. The men complained that those corporations had increased the size of the cars at the mines. The engineers of the Susquehanna Coal Co. also submitted their wage grievances.

COMING MEETINGS

M. O. I. Coal Association annual meeting will be held June 22-25, 1915, at Cedar Point, Ohio. Secretary, B. F. Nigh, Cleveland.

Rocky Mountain Coal Mining Institute will hold its next meeting in Trinidad, Colo., June 8, 9 and 10. Secretary, F. W. Whiteside, Denver, Colo.

West Virginia Mining Institute will hold its summer meeting at Wheeling, W. Va., June 15 and 16. Secretary, E. N Zern, Morgantown, W. Va.

Mine Inspectors' Institute of the U. S. A. will hold its annual meeting June 8, 9, 10 and 11, 1915, at St. Louis, Mo. Secretary, J. W. Paul, Pittsburgh, Penn.

American Society of Mechanical Engineers will hold its summer meeting at Buffalo, N. Y., June 22-25, 1915. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

American Mine Safety Association will hold the following meets: June 1, Moberly, Mo.; June 5, Des Moines, Iowa; July 2-3, Big Stone Gap, Va.; July 23-24, Billings, Mont. Secretary, H. M. Wilson, 40th and Butler St., Pittsburgh, Penn.

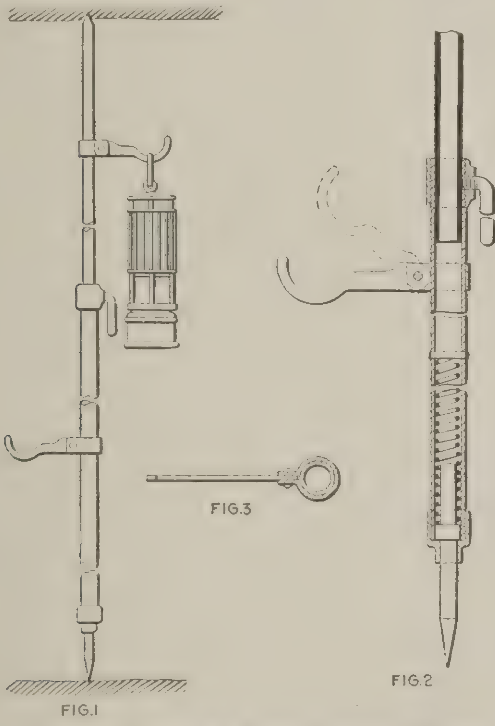
New Apparatus and Equipment

Believing that one of the greatest services that a journal such as Coal Age *can render its readers is to acquaint them with new and improved equipment which may be employed directly or indirectly to the benefit of the coal-producing industry, this department is inaugurated. For the present it will appear in the second and fourth issues of each month. We shall therefore be glad to receive from builders, manufacturers or dealers brief descriptions of new or improved pieces of apparatus in which they are interested, the use of which will tend toward better results in or the economic development of the fuel industry or any of its numerous ramifications.*

⁂

New Support for Safety Lamps

In the mining of coal where safety lamps must be used the miner is often compelled to work in a position where light is needed near the roof of the mine. Heretofore he has either placed the lamp on the floor, where it was liable to be knocked over and broken, or has driven a nail in one of the posts, or even into the coal of the rib, from which he suspended the lamp. Even under these conditions, he often failed to get the lamp in a position where its light would be most effective.



Details of the New Safety-Lamp Support

To obviate these difficulties, Charles J. Maher, of Manor, Penn., has invented a safety lamp support. As may be seen in the accompanying drawing, this consists of two pipes, one telescoping within the other and each provided with a sharp point. The lower point or foot of the support is so arranged as to be under the tension of a spring when forced against the mine floor. The upper section may then be pushed against the roof and clamped in position, when the spring-actuated foot will hold the support firmly in place.

Two lamp hooks are provided, one upon the lower section of the support, which is the larger in diameter, and the other upon the upper, or smaller, section. These are so arranged that by folding up the hook proper the yoke which attaches it to the support may be slipped up or down throughout the vertical length of the section upon which it is mounted. Lowering the hook and attaching the lamp holds this hook securely in position.

This support is light and easily portable and will hold a safety lamp in almost any position between the floor and roof of the mine. The support may therefore be so placed and the height of the lamp so adjusted as to give light at the point most needed in the miner's work.

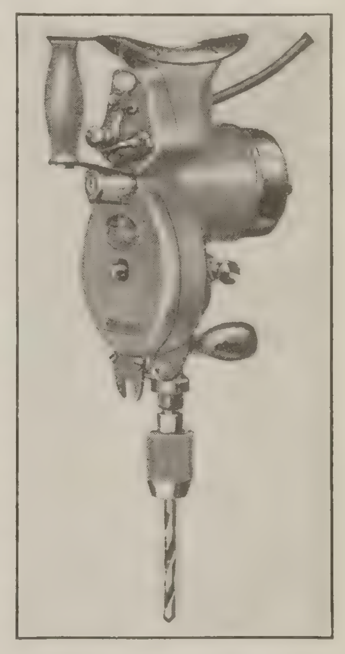
⁂

A New Line of Portable Electric Drills

The "Temco" line of portable electric drills recently placed on the market by the Western Electric Co. are especially designed to give long and efficient service under severe conditions and hard usage and are essentially all-around tools.

These electric drills have the general shape of an ordinary breast drill, are compact in design and light in weight. The weight is well balanced, making handling easy, while the electric switch is conveniently placed near the handle.

A special feature is the ease with which the motor may be reversed when the drill sticks. Whether working at high or low speed, a touch of the switch reverses the motor, loosening the drill or sending it ahead as required. These drills will also tap holes, the reversing feature being here of great advantage.



One of the New Portable Drills

Temco drills are particularly advantageous when holes are to be drilled or tapped where the material cannot be carried to a drill press. The tool is then carried to the job. They are also handy for working inside objects, or upside down and in other inconvenient places.

The motors are built to operate on either direct or alternating current at standard voltages. The two principal sizes are model B and model C, the former having one and the latter two motors, making it especially adapted to the hardest kind of work.

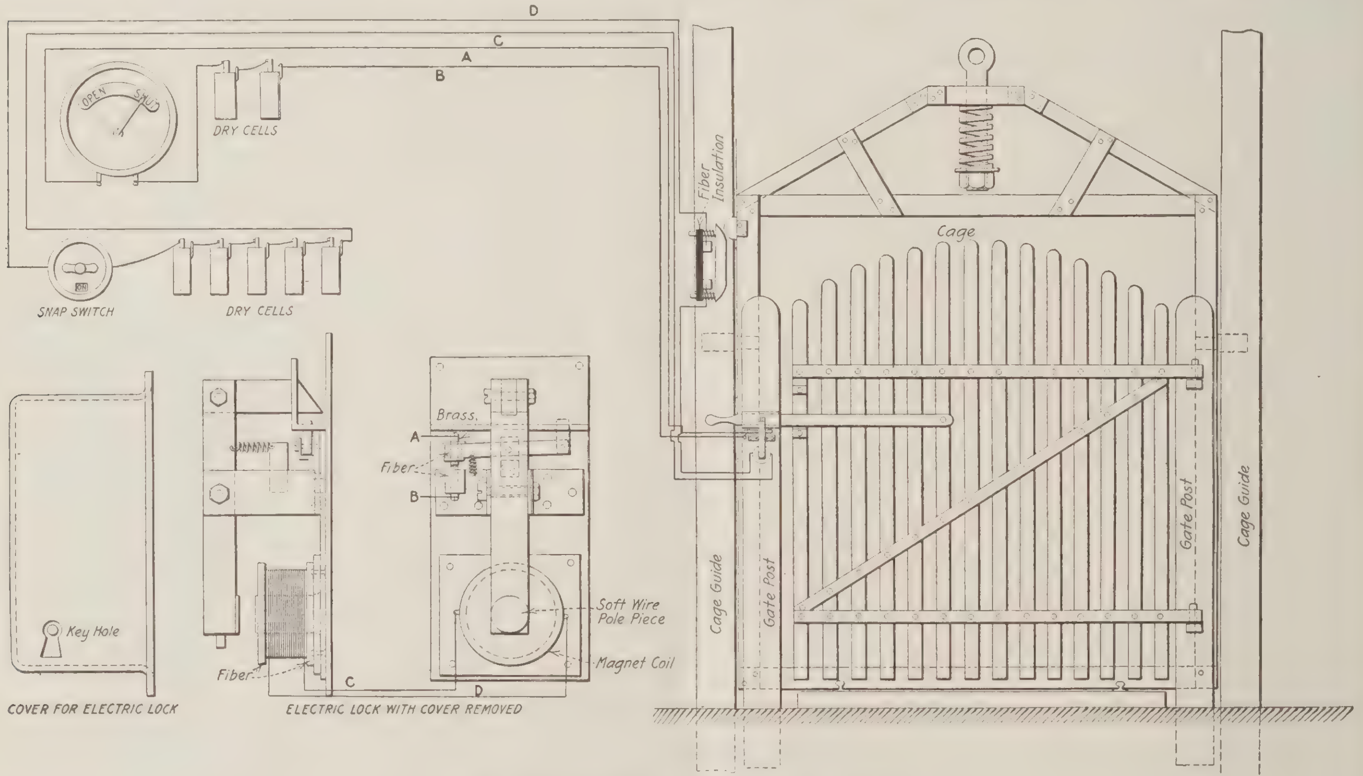
The motors are of the high-speed commutator type, having forged nickel-steel shafts and built-up cores of magnetic steel. The commutator consists of hard-drawn copper bars of ample carrying capacity forced together under high pressure and insulated by selected mica.

Model B drill has a capacity up to and including 3/8 in. in steel, cast iron or similar substance and weighs 12 lb. complete. Model C has a capacity of 1/2 in. in steel, has two speeds and weighs without the chuck about 19 lb.

The Western Electric Temco line of tools also includes a tool-post grinder, a valve grinder for automobile engines and a buffer and polisher.

Automatic Safety Lock and Dial Indicator

An automatic safety lock for shaft gates, together with a dial indicator showing whether the gate is open or closed, has been invented by W. A. Williams, of Barton, Ohio. The object of this device is to automatically lock and unlock the gates of elevator shafts, particularly those on the hoisting shafts of coal mines, during the time that men are being hoisted or lowered.



THE AUTOMATIC LOCK AND INDICATOR

The accompanying drawing shows a cage at the shaft landing, and a gate hinged to a post. On the gate a bar is pivoted which extends through a keeper and is movable vertically at one end. On the face of the adjacent gatepost is a plate with a suitable catch for holding the locking bar.

An electromagnet is introduced into the locking mechanism in such a way that when it is energized a bolt is withdrawn from the lock, allowing the locking bar to be swung out of contact with its catch, thus permitting the gate to be opened.

The coils of this electromagnet are included in and form a part of an open electric circuit, one side of which leads from a source of electric energy while in the other is a bridge-piece or switch. When the cage is approaching the position at the landing, a contact mounted upon it closes the circuit, thus energizing the magnet, withdrawing the bolt in the lock and allowing the locking bar to be elevated. If the cage is but slightly moved, however, the contact is broken and the locking bar cannot be moved.

A snap switch is also introduced into the circuit whereby the latter may be broken, rendering the latch bolt inoperative so that the gate is held in a closed and locked position. This snap switch may be located at any convenient point, usually in the engine room.

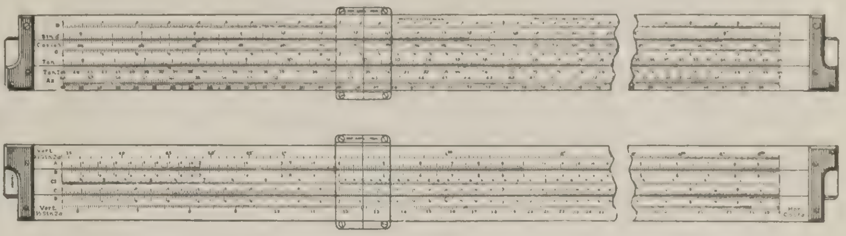
The electric lock is provided with a cover and so arranged that the introduction of a suitable key will open the lock independently of the electric circuit. This key of course permits of the gate being opened when the cage is not at the landing. It should be carried by some person in authority so that the gate may not be opened and left open by some irresponsible individual.

In the engine room a dial indicator is placed which shows at all times the movement of the latch bar through suitable electrical connections. When the latch bar is disengaged from the locking mechanism, the dial stands at the open position, while when the gate is closed and the latch bar dropped into its place, the dial stands at shut position. Thus whenever the engineer receives a signal to either hoist or lower the cage, he may know at all times whether the gate is open or closed and locked.

A New Surveyors' Slide-Rule

The fact that all astronomic data essential to surveying, such as azimuth, time, latitude, etc., can be ascertained by means of an ordinary transit with vertical circle, but without solar attachment, is seldom utilized in this country. The chief reason for this is the difficulty of computing in the field by spherical trigonometry the result of the observation.

The Keuffel & Esser Co., of New York, has recently placed on the market a surveyor's slide-rule which entirely eliminates this difficulty by reducing the hitherto complicated calculation to mechanical operation, thereby rendering the method of field astronomy with the engineers' transit extremely simple and practical.



FRONT AND BACK OF THE SURVEYORS' SLIDE-RULE

The new rule, which is 20 in. long, of the duplex type, having a double face, has been evolved to meet the requirements of the modern surveyor that demand that it shall be fully commensurate in accuracy with the standard transit, reading to one minute of arc. The scales are conveniently arranged for handling all problems arising in the field, while the length of the rule permits of fine subdivisions on the trigonometric scales, and consequently the necessary accuracy is easily attainable.

One face of the rule is arranged for the determination of the meridian by direct solar observation and solves the formula

$$Cos\ A_z = \frac{\cos h \cos l}{\sin d} - \tan h \tan l$$

with only three settings of the slide and the use of the runner or indicator. This face also has the sine and cosine scale used in computing the latitudes and departures of courses.

This side of the scale has been provided with these features: The regular D-scale; the sine D-scale from 2° 22′ to 24° for declination; the cosine L- and H-scale from 0° to 84° 15′ for latitude and altitude respectively; the regular C-scale; the tangent scale from 5° 43′ to 45°; and the tangent scale inverted from 20° 50′ to 75°; the azimuth scale (which is one of natural cosines) for reading azimuth or cosine bearings for angles from 0° to 60° referred to an adjacent scale of equal parts.

The other face of the rule has the usual scales A, B, C1, C and D for all general numerical calculating, as well as two stadia scales for computing horizontal distances and vertical heights.

This rule, 20 in. long, with "frameless" glass indicator, in case with directions is catalogued at $18.

Legal Department

Validity of Mining Laws

By A. L. H. Street*

The chapter of the Kansas Coal Mine Law which requires operators to maintain bathing facilities for use of their miners on leaving work is sustained as being a valid regulation in a decision recently handed down by the state supreme court (State vs. Reaser, 145 Pacific Reporter 838).

The constitutionality of the law was questioned on the ground that the regulation involves a discrimination against the coal-mining industry, in that operators of lead, zinc, gypsum and salt mines are not subject to the requirement. But the supreme court holds that coal mines constitute a sufficiently broad class to warrant the regulation. Part of the opinion reads:

"The determination of the necessity and wisdom of a police regulation rests, in the first instance, upon the Legislature and if there be reasonable grounds for exercising such power, the court should not interfere, although its judgment might not fully concur with that of the Legislature."

The court assigns as justification for the law the facts that the temperature in mines, the dampness of the atmosphere, and other conditions of mine work render it a great protection to the health of miners that the requirements of the act be observed. "The health of the employee is a matter of concern not only to himself but to the employer and the public as well."

As sustaining the decision, the supreme court refers to cases wherein similar laws have been upheld in other states, and to the following statement made by the United States Supreme Court:

"The regulation of mines and miners, their hours of labor, and the precautions that shall be taken to insure their safety, health and comfort, are so obviously within the police power of the several states that no citation of authority is necessary to vindicate the general principle."

* * *

Rupture as Subject of Compensation Award—The West Virginia Workmen's Compensation Act authorizes allowance of compensation for injury or death of an employee, resulting from a rupture sustained in lifting a heavy object in the course of his employment. (West Virginia Supreme Court of Appeals, Poccardi vs. Public Service Commission, 84 Southeastern Reporter 242.)

* * *

Right of Miner to Rely on Pit Boss' Promise—Where an operator's pit boss assured a miner that a dangerous defect in a mine track would be remedied by a certain day, the miner was under no legal duty to inspect the place after that time to determine whether the danger had been removed, as affecting his right to recover damages for consequential personal injury. (Colorado Supreme Court, El Paso County Land & Fuel Co. vs. Perdaris, 147 Pacific Reporter, 675.)

* * *

Liability of Stockholders of Dissolved Corporations—Under the statutes of Kansas, when a coal-mining company dissolves, leaving unpaid a claim against it for wrongfully mining coal on the lands of another, the stockholders may be held liable on such claim. (Kansas Supreme Court, Abernathy vs. Loftus, 147 Pacific Reporter, 818.)

---

*Attorney-at-law, St. Paul, Minn.

Editorials

Eastern Ohio Wage Agreement

We are told that the settlement in Ohio should be a source of great gratification. It does not, however, add anything to the national prosperity as the return to work of the eastern Ohio mines will only render idle or less active many operations in other fields. It does, however, spread the evils of inactivity more evenly over the country, and that in itself is a gain.

We congratulate the people of eastern Ohio, especially the operators, because the new contract will make possible a better system of working whereby coal will be conserved and will be prepared in better shape for the market. The rooms have been in the past far too wide, and the coal in the ribs has consequently been lost.

The miners have obtained the letter of their demands—47c. per ton for machine-mined run-of-mine coal—but to get it they have had to make substantial concessions. These may yet make trouble when the schedule comes into operation. When the operators and miners were in session the miners loudly proclaimed that there were to be no concessions on fundamentals, but the letter which Charles J. Albasin, president of the subdistrict, addresses to the miners shows that he has doubts as to the satisfaction of the men with the scale as now signed. In this he says:

> We have done our full duty without any apologies. Now we have reached a settlement with the eastern Ohio coal operators that in our opinion spells victory and vindication of our long struggle. We are fully confident that we did not receive everything for which we were contending, but taking into consideration the tremendous opposition that was continually massed against us and the deplorable industrial conditions surrounding us, we believe that we have done the best possible under the circumstances. We desire to have your full coöperation. Be prudent and self-possessed; don't permit any prejudice to carry away your best judgment.

All this does not spell "sweeping victory" as stated by the official organ of the union. Men do not need to be coaxed into the rôle of victors. And indeed a sweeping victory would have been a sweeping defeat, for the eastern Ohio miners would have been swept into pauperism by such a triumph. While the rate per ton would have been somewhat more than fair, the amount of work the mines would have secured from the market would have been so greatly restricted that the yearly wage of the miner would not have sufficed for his sustenance. It is to be hoped that the concessions have saved the miners from this possibility.

There were formerly about 18,000 miners in the subdistrict. Of these about 6700 have moved away during the 13½ months of idleness, and the operators have agreed to give those who stayed the advantage when selecting workmen. This they should do, seeing that many owe rent for all the time during which they were idle.

The actual figuring of the division of increased pay for cutting and loading would have awarded 7.95c. per ton to the machinemen and 39.05c. to the loaders. The operators insisted on giving the cutters 8c. and the loaders 39c., thus increasing the rate of the cutters 0.629 per cent. and decreasing that of the loaders 0.128 per cent. from the rates which would otherwise have been obtained, but as both were receiving an increase in scale rates of measurable importance these imponderable variations were unworthy of consideration.

The change in distribution between machinemen and loaders was negligible, but it aroused bitter antagonism between them and nearly prevented ratification. It normally should travel in the opposite direction, for as machines increase in their effectiveness the scale rate for cutting should lag in percentage behind that for loading.

Until mechanical loaders or conveyors are introduced, a cheaper explosive is invented or a method of cutting making less powder necessary is put into operation, the work of the loader will hardly become any easier. On the other hand, the work of cutting progressively grows less time-consuming and no revolutionary changes are necessary to make it more rapid.

The idea of the operators doubtless was that the narrow work to be introduced would press more severely on the machinemen than on the loaders and that the percentage between them should be revised accordingly. But there was much bad feeling between these classes of labor and the decision of the operators has increased the tension.

Three of the smaller operators have declared that they cannot make ends meet under the new scale, and George S. Jones, of the George M. Jones Coal Co., of Cleveland, states that the Webb and Pultney No. 2 mines at Bellaire will not be opened owing to lack of business. The new scale is apparently a draw with both sides thoroughly exhausted. Neither side can be regarded as having won a real victory. In fact, like all industrial strife, the end is unsatisfactory to both.

Italian Demand for Coal

The demand from Italy for American coal, which developed almost immediately upon the breaking out of the European war last August, is now certain to be greatly augmented, as Italy's entrance into the war shuts off the supply from Germany. For years Italy has imported annually about 10,000,000 tons of coal and coke, her own production being only about one-fourth as much.

In 1913 Italy imported 9,647,000 tons of coal from the United Kingdom, and in the first half of 1914 the imports were at a slightly greater rate, but the war caused such a reduction that the total for 1914 was only 8,625,000 tons, showing a decrease of 1,022,000 tons for the year.

Italy imported in 1913 from Germany 1,073,000 tons of coal, of which 441,210 tons, or 41 per cent., was shipped via the St. Gothard railway, the remainder being by routes since closed by the war. Statistics are available only through last December, showing shipments of coal from Germany to Italy by the St. Gothard to have been 150 tons in August, 12,000 tons in September, 27,000 tons in October, 35,000 tons in November and 48,000 tons in

December. It is probably safe to infer from these figures that the shipments have increased this year and may lately have been in the neighborhood of 75,000 tons per month. Italy's entrance into the war necessarily shuts off those supplies, and a correspondingly greater demand for American coal is reasonably to be expected.

⁂

Journalistic Ethics and Psychology

The ethics of no business is above criticism. It is not therefore surprising that journalistic ethics has its shortcomings. News is perpetually coming to every newspaper and finds its way into the columns. Credit is generally given to the source of the news, except perhaps in cases where credit is not desired and where the facts are not doubted.

In the Colorado trouble for many months the public saw nothing and heard nothing but the ex-parte statements of the agitators. The more distorted these utterances were the more valuable as news items they appeared. What did it matter that they were attributed to Mother Jones or John R. Lawson or other labor leaders? The reliability of these persons as witnesses was a matter of which the public was not competent to judge, and as journalistic ethics requires in the best daily papers that statements shall be made without comment, the accusations of these irresponsible persons received wide publicity without a vestige of contradiction.

After awhile the operators started to circulate their side of the case, and while the story doubtless modified editorials and in some cases inspired them, yet the statements failed to get a place in the news. This is a severe arraignment of the press. It had conscientiously republished all the stories of outrage while it did not publish the refutation.

It was not necessary that these corrections should be published by way of retraction, but they should have been given place as supplementary statements from other authorities. The public never received the views of the operators till the Rockefeller memorandum was inadvertently published, and thus the publicity campaign was largely thrown away.

And this complaint is made not against the yellow press only. There are some papers which stand consistently for right and others which sometimes seem to lean toward capital, but these like the anti-capitalistic papers failed to avail themselves of the news despite the fact that as furnished it was in excellent shape to attract attention and to be prepared for publication.

As a result the papers published much that they knew to be untrue without a hint that they knew it was unreliable. They did not of course in any way guarantee the news, but as they did not contradict or explain it they left it to be inferred that it was true and could not be controverted. Having forbidden editorial criticism in the news columns, having omitted references to the news editorially and finally having failed to print some of the material supplied them, they appeared to take the side of the agitators as if the stand of the calumniators of capital was without possible answer.

The West Virginia strike was handled similarly, with this difference—that at first there was no publicity of any kind and later Senator Martine became the protagonist for the forces of disorder. That legislator fortunately did not make a favorable impression on the public. He is distinctly less interesting in appearance than Mother Jones, while more is naturally expected of him.

It is largely by its judgment of persons that the public is swayed, and the people only began to get their bearings in the Colorado trouble when they compared the character of John D. Rockefeller, Jr., with that of his inquisitor, Walsh.

The public is not disposed to listen to arguments. It lights instinctively on men, and the restful humanitarianism of Rockefeller contrasted favorably with the disturbing vindictiveness of Walsh. The impersonal work of Ivy L. Lee, excellent as it was, failed to effect its purpose because it had a man relatively unknown behind it and could not even be quoted as his.

In the last analysis it is doubtful whether the newspapers' ethics or the operators' psychology of attention was most to blame. If at the first the coal companies had put out a man—the right man—and centered their defense around him, perhaps the papers would have been responsive and the public more friendly. Let us hope that the anthracite operators in the coming strike will be able to center their arguments on a striking, outstanding figure who will be the visible embodiment of their position and whose contentions will be published freely in the public press.

⁂

No Fear for the Future

The British are spending $150 a second on the war in which they are engaged and the press is urging on the public the stupendous significance of such prodigality. But we are expending about an equal amount for the running of federal, state, county, city and village governments and improvements. So after all probably Europe is not nearly bankrupt as we think, and a few years of economy—abstinence from liquors, increased devotion to business and reduction in the amount of domestic help—will erase the recollection of the war from the world's markets. Marvelous indeed would be the resources of the world if only everyone will save a little. Ten dollars saved by every citizen of the United States would give us a billion dollars. Little wonder is it that after every business depression trade leaps forward more energetically than ever before.

⁂

Explosives in Coal Mines

A letter from one of our readers suggests that mining men generally would be greatly interested in a series of articles covering the use, storage and transportation of explosives in coal mines. Since we agree fully with the idea, we wish to take this occasion to invite any and all of our readers who have had experience with explosives to to tell us (a) what methods they employ in shooting the coal—we would like to describe the system used in each field; (b) where permissible explosives have proved more economical and efficient than ordinary black powder; (c) what depth of borehole and what amount of tamping are employed; (d) remedies for blownout shots; (e) where electric shotfiring systems are successfully used; and (f) how explosives are transported and handled in the mines.

All articles dealing with any of the subjects suggested above will be most acceptable for publication in COAL AGE. Let us hear from all our readers who are qualified by experience to write on the topics outlined.

Discussion By Readers

The Trouble Maker

I am led to make the following comments after reading the interesting account in "Extracts from a Superintendent's Diary," Coal Age, Apr. 24, p. 716, in which is described very vividly the visit of a delegation of women to the office of the mine superintendent of a large coal corporation. The women were campaigning the state in the interest of a proposed child-labor law.

The account given shows quite clearly that, while these women were no doubt sincere in their purpose and self-sacrificing in their efforts in behalf of good legislation, they had permitted their minds to become prejudiced to the true facts as they existed in and about the mines. They were ready to believe what they had been told—that the operator is a grafting, grabbing baron; they had come to regard the average miner as an inveterate kicker who constantly carries a club. Indeed, in their talk with the superintendent, they acknowledged that they had listened for two hours to the address of a labor leader, who they assumed correctly represented the views of the company and the men. They did not realize that they had been listening to an agitator—a trouble maker.

To the suggestion of the superintendent, after he had patiently listened to what the ladies had to say and had asked them to interview some of the men for themselves, they replied that they were already familiar with the views and the conditions of the miners. They said that the man who had addressed them had requested that they should withhold his name, fearing that he would lose his job if his interest in the matter were to become known.

The speaker had so prejudiced the minds of these women that they could not realize that the representative body of operators and miners alike compose as high a type of capital and labor as can be found in any industry. The fact that the superintendent was willing for these visitors to interview his men should have made clear to their minds that he had a contented lot of workmen whose ideas when expressed would not be at variance with his own and would not be in opposition to the well-known policy of the company.

The incident shows clearly that the agitator is a real trouble maker—a busybody and a menace to the peace and harmony of any mining camp. His purpose is to create a false impression and to bring about a feeling of dissatisfaction among the workmen. He is thus responsible for the larger part of the friction that exists, from time to time, between the miners and their employers. The agitator starts discord by influencing the small and noisy element among the miners to believe that they have a fancied grievance that should be adjusted. It is a comparatively easy task to convince this class of miners that they are being robbed or to make some operators believe that their miners are taking an unfair advantage of them. The submission of these unjust complaints, through a committee or a local union, has the effect to prejudice another *just* complaint in the eyes of the operator who gives the matter slight attention.

In closing, permit me to say that with a contract system in force between the operators and miners, determining the wage scale and the duties of both parties and providing for the settlement of disputes that may arise, there is no logical place for the irresponsible agitator. The way is thus provided by which a real grievance presented by either the miners or the operators acting as a whole can be readily adjusted in a fair and amicable manner. In my remarks I have referred only to the local agitator who goes about looking for points of contact that can be made to develop friction. The elimination and downfall of this class of agitator would go a long way toward establishing industrial peace.

SUPERINTENDENT OF MINES.

New Straitsville, Ohio.

Preventing Mine Explosions

Having read with great interest the letters in regard to rescue work following explosions in mines and the discussion of the question, "What recognition should be made for acts of bravery performed by miners at such times?" the thought occurred to me that it would be well for both miners and operators to give more attention and make greater efforts to prevent the occurrence of these explosions as far as it may lie in their power. By so doing, it will be possible to reduce the number of mine explosions to a minimum.

Many of the causes of mine explosions are so simple and plain as to be recognized at once by all practical coal miners and operators. The question is, What can be done to remove these causes and prevent their natural results? For example, many explosions are caused by the too rapid firing of shots, as well as the firing of shots that the practical judgment of competent men would condemn as being dangerous. The best means of preventing accidents from this cause is by means of strict regulations in regard to blasting.

Particularly in gaseous mines the following rules and regulations should be enforced: 1. No shots should be fired while men are in the mines. 2. All holes should be examined by competent men before they are charged. 3. The charging and firing of all shots should be performed by competent shotfirers after the men have left the mine. 4. The shotfirers should be compelled to proceed with their work slowly. 5. There should be a sufficient number of these men to divide the mine into separate districts, so that one man will not be required to fire from 300 to 400 shots in one or two hours, as is often the case. 6. The shotfirers should be authorized to condemn and refuse to fire any shots that in their judgment would be unsafe.

The object of proceeding slowly with this work is to give the air current time to sufficiently clear away the gases produced in firing and which always to some extent are forced back against the air into adjoining places where shots are yet to be fired. The firing of shots should always begin on the last of the air and progress in a direction against the air current so that subsequent shots will be fired in comparatively pure air. The velocity of the air current should not be too great; neither should the circulation of air be cut off while firing is in progress in the mine workings.

Another danger inviting mine explosion is the accumulation of gas in old and abandoned workings and void places in the mines. Any heavy fall of roof in these places will force the gas out into the live workings, and its ignition may result in an explosion of gas and dust that may be extended throughout the mine. To reduce this danger to a minimum, all timbers should be withdrawn as a place is finished and every effort should be made to cave the roof so as to close the opening.

Drawing all timber will not only prevent the danger of a squeeze, but will give no opportunity for gas to accumulate in dangerous quantities. Also, the value of the timber recovered will generally pay for its removal. There is always more or less danger in maintaining a large open area standing on pillars. Old workings that are not closed or sealed off should be ventilated thoroughly and examined every day. Where gas is found in any place, that place should be securely fenced off to prevent anyone from entering until the gas can be removed by competent persons after the men are withdrawn from the mine.

Another danger that is preventable with proper attention is the accumulation of dust and fine coal on the haulage roads and airways and at the working-face. In dusty mines it is particularly necessary that strict regulations should be enforced in regard to the loading out of all fine coal and dust. Men should not be permitted to stow this fine material in the waste, as it is liable to be thrown into the air by any violent concussion such as may be produced by a heavy or windy shot or a possible blownout shot. When suspended in the air, this fine dust is a menace to the safety of the entire mine. A further precaution to prevent the accumulation of dust on the roadways is to use dust-tight cars for the haulage of the coal, avoid overloading the cars and clean up the roads at regular short intervals.

I have mentioned but three of the more important preventable causes of mine explosions to which all practical mining men should give heed. If gas and coal dust can be taken care of at the working-face and on the roadways in mines by the enforcement of suitable mine regulations, many explosions will be prevented and lives saved.

Longwall in Pittsburgh Sea

Letter No. 8—I have been much interested in the question of mining the coal of the Pittsburgh seam by longwall. My attention was particularly drawn to Letter No. 7 by John Oldroyd, COAL AGE, May 15, p. 859.

Mr. Oldroyd states that the only way to work the Pittsburgh seam on the longwall plan is to drive the entries to the property line and work the coal back on the retreating plan. In my opinion, this method would prove too expensive, as in many cases it would require perhaps two or three years for the entries to reach the property line and the work on the coal to commence. In regard to his statement that "No one who has had experience in the working of the Pittsburgh seam would attempt to mine the coal by the longwall advancing method, except possibly someone who has more money than brains," it may be said that there would naturally be more than one opinion on that point.

I want to present a plan that I have designed for working the Pittsburgh seam on the longwall advancing method. The plan possesses the advantage over the common longwall system in that there are no entries to be maintained through the gob, no packwalls to build, and no ripping or brushing of the roof is required. All the coal is mined by machine, and the entire operation, which I claim is feasible, is in compliance with the bituminous mine law of Pennsylvania. The proposed method will yield cheaper and better coal and will prove less dangerous than the common longwall system. I shall be glad to answer any questions in reference to this plan, which may be described as follows:

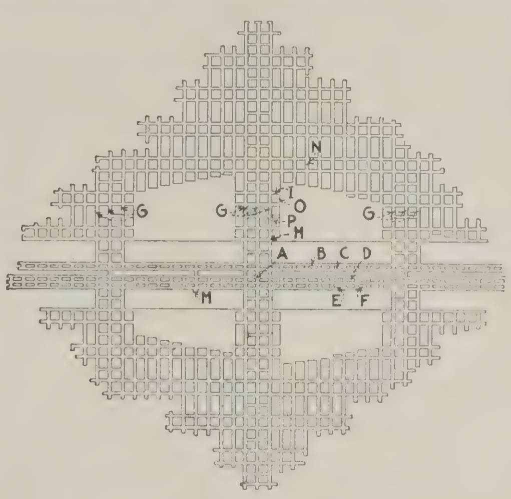

FIG. 1. GENERAL PLAN OF THE PROPOSED LONGWALL PANEL WORK

The development of the mine is shown in Fig. 1, which is not drawn to scale but is designed simply to show the general arrangement of the main butt-entries and face-entries with respect to the longwall face in each panel. A detailed plan drawn to scale and showing one section of the mine is given in Fig. 2. The letters in each of these figures refer to the same items.

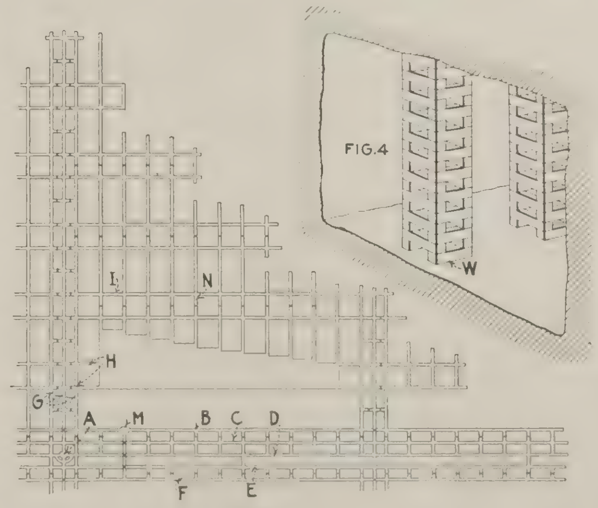

FIG. 2.

FIG. 2. DETAIL PLAN OF SINGLE SECTION
FIG. 4. METHOD OF BUILDING CRIBS

Two shafts were sunk from the surface to the coal. The hoisting shaft *A* is the downcast and the airshaft *M* the upcast for the entire mine. The mine is opened by driving five parallel entries on the butts of the coal. These are marked in the figure *B, C, D, E* and *F*. The middle entry *D* is the manway or traveling road, while the two entries *C* and *E* on either side of this are the haulage roads for each side of the mine. These three entries are all intake air-courses. The two outside entries *B* and *F* are the return airways for each side of the mine.

As shown in Fig. 2, face-entries *G* are now driven three abreast at right angles to the main butt-entries, the first set of face-entries being opposite the hoisting shaft. On each side of this first set of face-entries, other face-entries are driven three abreast, leaving a block of coal 1360 ft. wide between them. All entries are driven 10 ft. wide, the pillars on the main butt-entries being, say 10 yd. and those on the face-entries 8 yd. in thickness.

As shown further in Fig. 2, other butt-entries are then driven in pairs between each set of face-entries. The entries in each pair of butts are driven on 115-ft. centers, or with pillars 105 ft. thick between them. There is a block of coal 210 ft. wide between each pair of butts. Finally, face-entries are driven on 115-ft. centers off these butt-entries.

It will be seen that this plan divides the entire coal bed, as it is developed, into blocks of coal 105x105 ft., which form the pillars of each pair of butt-entries, while the coal between the consecutive pairs of butts is divided into blocks 105x210 ft. Fig. 2 shows about how much the entry work should be developed ahead of the working faces.

In Fig. 3 is shown in detail the method of drawing back the blocks of coal that form the working face in each panel lying between consecutive sets of the face-entries previously mentioned. As shown in Fig. 2, this work of drawing back the several blocks is commenced at the first butt-entry, or about 210 ft. from the main butt-entry *B*, at the point marked *H* on the plan. Each block of coal is undercut its entire width of 105 ft., by machine.

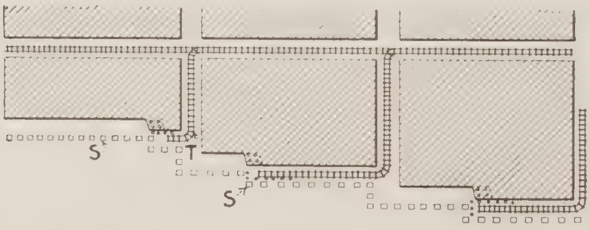

FIG. 3. SHOWING A SECTION OF WORKING-FACE IN ONE PANEL

A clear distance of 7 ft. is maintained between the face and the cribs shown in the figure. This allows 5 ft. for track and 2 ft. of clearance to pass the cars and to set posts on the face side while working. It is important to keep each of these consecutive faces three cuts ahead of the face next following. The cribs are shown at *S*, while the track for hauling out the coal is shown at *T*. As indicated in the figure, the track is taken up and the cribs moved forward a distance of one cut as the work proceeds.

As shown in Fig. 4, the cribs are built of blocks of wood 2 ft. long and 6x6 in. in section. They are set 2 ft. apart, and in order to facilitate their removal as the work proceeds, only one block is placed at the bottom at *W*, the opposite ends of the next blocks above resting on a mound of slate or dirt. These cribs hold the roof in very good shape at the working face and prevent the falls from reaching the face of the coal.

From a casual glance at Figs. 1 and 2, it may appear that there is an enormous amount of narrow work on which yardage must be paid. I think I can show, however, that there is not as much narrow work in this panel longwall system as in the ordinary room-and-pillar system.

HARRY BROWN, Mine Foreman,
Hazel Mine.

Canonsburg, Penn.

⁂

Efficiency in Indiana Mining

In his letter entitled "Efficiency in American Mining," COAL AGE, May 8, p. 818, Samuel Dean contrasts the conditions existing in European mining with those in our own country in the following words:

> The lesson to be learned by these reflections is that if the European mine owner can have a magnificent mine building, palatial bathhouses and offices, garden villages and parked areas, and can still pay his workmen adequate compensation for injuries, extract all his coal, observe strict and burdensome laws in respect to the mining of the coal and yet show a low fatal-accident rate while paying 10 or 20 per cent. on his common stock—surely, that is "efficiency. . . . . If, as is true, numerous coal-mining companies here are tottering on the brink of bankruptcy owing to the ridiculously low selling prices of coal, the question that is of the first importance is, How are conditions exising here to be improved?

I will not attempt to answer this question, as I do not claim the ability to do so conclusively. I desire, however, to go on record as a "booster" for a movement that has been recently inaugurated in Indiana, which is a step in the right direction, if it does not *actually solve* the problem suggested in the above quotation. I refer to the action of Indiana coal operators in their proposed consolidation in respect to the sale of their coal.

An obvious answer to Mr. Dean's question is, Either increase the selling price of coal or reduce the expenses of operation and of marketing the product. Increasing the selling price of coal is a legitimate means of increasing profits *only* when such profits are reasonable, and the consumer always has a right to be shown that such increase is necessary. He cannot be required to pay for the mistakes made in producing the coal or the wasteful methods of mining.

Indiana coal operators have recognized these rights of the consumer, and in the present movement they aim to correct the wasteful methods of production rather than to increase the selling price of the product. This aim is clearly brought out in the statement made that under the system of a single selling agency such as is proposed, the present earnings can be increased fully 10c. per ton without adding to the selling price on the market.

A further answer to Mr. Dean's question would consider reducing expenses, either by cutting wages in the operating department or by eliminating unnecessary expenses in the sales department. But here also no attempt should be made by the operators to shift the burden to other shoulders. If it was expected, however, that a reduction in wages would effect the desired results the attempt would fail, since under the present system of unrestrained competition any reduction in wages would only be followed by a reduction in the selling price of the coal.

In this respect, the proposal of the Indiana operators should find general approval. They do not aim at a reduction in wages, but a consolidation of interests in the marketing of the product of their mines. The proposition will not add any burden to either the consumer or the wage earner, as it contemplates a reduction of unnecessary expenses in the sales department. It may involve standardizing the methods employed in the preparation of the coal in respect to sizing and cleaning it after it is taken from the mine.

A large saving can also be effected by eliminating some undesirable grades for which there is but a slight demand and which at the present time are thrown on the market at a loss in order to supply the demand for other grades. Another consideration would be the providing of storage facilities for those grades for which there is an unsteady demand. By thus storing and holding such grades for a more favorable market, a vast saving would be effected. In this manner, great opportunities are open for the conservation of the coal produced.

Incidentally, the proposed consolidation of interests will reduce the operating expenses as well. At present, operators are required to keep their plants in a state of preparedness to load coal on short notice. This results in a large expenditure with no corresponding income resulting therefrom. With a proper distribution of orders, each mine could be run more regularly for a definite period and then shut down with the knowledge that no sudden call would be made that would require constant preparedness.

The Indiana coal operators estimate that 200,000,000 tons of this nation's fuel supply is being wasted every year. The reason given for this is that present profits do not warrant the mining of coal that is not easily accessible and permits of a low expense of operation. The operators have no desire to violate the law or to form an illegal combine. They invite government investigation and government aid in forming the proposed consolidation, claiming that this would safeguard the interests of those indirectly affected.

Through their secretary, I. F. Callbreath, the operators presented a statement of the conditions that they are forced to meet, together with their suggested plan of coöperation, to the Federal Trade Commission, to the Department of Justice and to President Wilson. It goes without saying that a movement of this sort, brought about by legal means properly restricted to its avowed purpose and which does not infringe upon the rights of others, should receive the hearty support of all interested in good mining conditions.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

CHEMISTRY OF GASES

The chemistry of all matter treats of the interchange of the atoms constituting molecules, by virtue of which interchange the character and nature of the matter is wholly altered. In other words, the matter is transformed and a new substance created having properties that vary widely from those of the original substance.

Chemical Reaction—The change that takes place when matter is thus transformed is a **chemical change,** and the action is described as a "chemical reaction." It assumes an intimate contact between two unlike substances, under conditions that favor an interchange of atoms. The reaction that takes place is the direct result of the different affinities of the atoms for each other.

Chemical Affinity—The theory of chemical change supposes that all atoms constituting matter have various affinities or **degrees of attraction** for each other. By reason of this difference in the affinities of atoms, an interchange may or may not occur when two unlike substances are brought into intimate relation with each other, according as the atoms of the original substances possess a less or a greater affinity for each other in their present state or grouping. If the atoms of one of these substances possess a greater affinity for atoms of the other substance an interchange of atoms will take place and new substances will be formed that will be wholly different from the original substances.

Influence of Heat to Produce Chemical Change—The theory of heat assumes a wider separation of the particles of matter as the amount of heat in a substance is increased. Thus, it naturally follows that a higher temperature invites a more intimate mingling of two different gases in contact with each other. This intermingling of the gaseous molecules greatly assists the chemical reaction, which otherwise would not take place.

Examples of Chemical Change—The most common and familiar examples of chemical change are those due to the strong affinity of the oxygen of the air for most other matter. The resulting reaction is described as **oxidation.** The more familiar forms of oxidation are the rusting of iron and some other metals in a damp atmosphere. The action results in the "corrosion" or eating away of the metal and the formation of an oxide, which is quite different in its character and properties from the orginal metal.

Combustion—In a general sense, any form of oxidation is combustion, and the latter term does not relate alone to oxidation, but describes generally any chemical reaction in which one substance is consumed either slowly or rapidly by reason of the presence of another substance whose atoms possess an affinity for those of the first that invites reaction.

The substance consumed is termed the **combustible** and the other the **supporter of the combustion,** while the substances produced are the **products of the combustion.** The products of a combustion may be gaseous, vaporous or solid, the last named being the **ash** of an active combustion.

The Coal Age Pocket Book

Slow Combustion—This term implies a slow but continuous wasting away of the substance consumed, the conditions being unfavorable or the affinities of the atoms being insufficient to support a more rapid reaction. Slow combustion is characterized by the generation of **heat** without the production of **flame.**

Active or Rapid Combustion—Active combustion is generally accompanied by the production of flame. The same amount of heat is generated in less time, resulting in a higher temperature, which in turn frequently modifies the products of the combustion.

Spontaneous Combustion—Under certain favorable conditions, combustion may start in a mass of combustible material without the application of flame or other exciting cause. This is due to the natural **generation of heat** within the mass owing to chemical reaction taking place between the substances. The action is explained as being chiefly due to the **absorption of oxygen** from the air by the substance, when the ensuing oxidation generates sufficient heat to ignite both the gas produced by the combustion and the material. The combustion, which is at first slow, may, in time, develop actively and inflame and consume the material.

Chemical Symbols—A chemical symbol is a letter or letters used to designate an element or simple substance. The symbols of the more common elements together with their atomic or specific weights have been given in a table, previously. The symbol written alone expresses a single atom of the substance; but, since an atom is not conceived to exist alone, the symbol of an element should always be written as a molecule.

Symbol of a Molecule—A molecule is assumed to be the smallest chemical division of matter that can exist in a free state. A molecule of any simple or elementary substance is assumed to contain two atoms only. Its symbol is expressed by writing the symbol for that element with a subscript ($_2$) to indicate two atoms; thus for the molecule of carbon, write C_2; oxygen, O_2; etc.

The molecule of a compound substance may contain any number of atoms and is expressed by writing the symbols of its elements each with a subscript figure indicating the number of atoms of that element in the molecule. A single atom of an element is indicated by the symbol only, omitting the subscript figure.

The following examples will serve to illustrate the fact that, while a molecule of any simple substance is taken to contain two atoms only, the molecule of a compound may contain any number of atoms:

Substance	Composition		Symbol
Carbon monoxide,	carbon, 1 atom; oxygen, 1 atom;	= 2 atoms;	CO
Carbon dioxide,	carbon, 1 atom; oxygen, 2 atoms;	= 3 atoms;	CO_2
Ammonia,	nitrogen, 1 atom; hydrogen, 3 atoms;	= 4 atoms;	NH_3
Methane,	carbon, 1 atom; hydrogen, 4 atoms;	= 5 atoms;	CH_4
Olefiant gas,	carbon, 2 atoms; hydrogen, 4 atoms;	= 6 atoms;	C_2H_4

All these gaseous molecules are of equal size, though containing different numbers of atoms.

Inquiries of General Interest

Iron Pipe and Concrete for Mine Posts

If a 4-in. single-strength common wrought-iron pipe 6 ft. long is filled with concrete, will it carry a greater load when used as a mine prop than if the pipe had not been filled with concrete? Will a double-strength pipe filled in the same manner with concrete carry a greater load than the single-strength pipe? What I want to know particularly is whether filling the pipe with concrete increases its strength for use as a mine post.

CHARLES O'NEIL.

Tabasco, Colo.

This is a type known in concrete construction as "armored concrete." By filling the pipe with concrete its capacity for carrying the load is increased by an amount somewhat more than the compressive strength of the concrete, because of the increased rigidity of the column and its greater resistance to bending. The thickness of a standard 4-in. pipe is practically ¼ in.; that of an extra strong pipe, ⅓ in.; and that of a double-extra strong pipe, ⅔ in. These pipes used as columns 6 ft. long and with fixed flat ends are rated to carry loads of 19.7, 27.3 and 49.3 tons respectively.

A concrete composed of one part good hydraulic cement, three parts sharp sand and six parts clean broken stone, or a 1 : 3 : 6 concrete, after having set one month will have an ultimate compressive strength of 1800 lb. per sq.in. and may be assumed to have a safe compressive strength when incased in the pipe of, say, 800 lb. per sq.in. On this basis filling the three kinds of pipe mentioned with concrete will add respectively 5.1, 4.6 and 3.1 tons to the strength of the pipe because of the compressive strength of the concrete. The capacity of 4-in. concrete-filled iron posts 6 ft. in length, for standard pipe, extra strong and double-extra strong, may therefore be estimated as, say, 25, 32 and 52 tons respectively. These pipes filled with concrete will weigh 23.5, 26.8 and 38.3 lb. per ft.

While such posts possess extraordinary strength as compared with wooden props, for use in mines, they undoubtedly possess the disadvantage of being very heavy and difficult to set in position, but especially difficult to remove when they have once taken the weight of the roof. The handling of such props from the surface to the working face in the mine would also prove a considerable item of expense.

⁂

How to Find a Ground in an Armature Coil

Kindly explain the proper course to pursue to find a ground in the armature of a dynamo that gives a shock. At our plant we have no instruments for this purpose, and I would like to ask if a current can be sent through the machine by connecting one terminal to the shaft and rotating the other terminal about the commutator for the purpose of detecting the ground. If this can be done, kindly explain the method.

MINE ENGINEER.

Des Moines, Iowa.

The proper way to detect a ground in the armature of a dynamo is by the use of a millivoltmeter. Not having this instrument, it is possible for an experienced operator to detect the trouble by the use of a small lamp instead of the voltmeter. In any case, the testing current must be one of low voltage, being regulated by several lamps introduced into the circuit until the desired result is obtained. When the voltmeter is used, the voltage of the testing current should be sufficient to give an ample deflection of the needle, say about half across the scale.

Assuming that the motor has been disconnected from the supply line and a low-voltage testing circuit provided, connect this circuit with the armature terminals, so that the current will pass through all the armature coils. The current should be sufficient to enable a satisfactory reading to be taken on the millivoltmeter or galvanometer, which is the most reliable means for locating the trouble in the armature.

Now, ground one of the leads of the millivoltmeter on the armature shaft and proceed with the other lead to explore from bar to bar, passing completely around the commutator. The two bars that give the least deflection of the needle of the voltmeter indicate the approximate location of the trouble and reveal the grounded coil.

In a parallel-wound armature these bars will be adjacent to each other, while in a series-wound armature they will be separated by two pole bases. The ground so indicated, however, may exist in the commutator segment instead of in the coil, and it is therefore necessary to make a further test to determine its exact location.

In order to do this, disconnect the two leads of the coil in question and proceed to test the coil alone. If the trouble exists in the coil, this test will show the same reading as before.

⁂

Mining Engineer Eligible

Kindly advise whether a mining engineer, 23 yr. of age and with 7 yr. experience as such in the bituminous mines of Pennsylvania, is eligible to receive a certificate to act as fireboss on passing the required examination.

MINING ENGINEER.

Avella, Penn.

The bituminous-mine law of Pennsylvania (1911) requires applicants for a fireboss certificate to "have had at least 5 yr. practical experience, after 16 yr. of age, as miners or men of general work and . . . experience in mines in Pennsylvania that generate explosive gas." A mining engineer is eligible under the bituminous law to take the examination and receive a mine foreman's certificate, but he is not eligible for the fireboss certificate.

Examination Questions

Pennsylvania Anthracite Mine Foreman's Examination Held at Scranton, May 18-20, 1915

(*Selected Questions*)

Ques.—What are the three greatest causes of accidents in anthracite mines? Give percentages of each, and state how you would reduce these accidents.

Ans.—The three causes producing the greatest number of accidents in anthracite mines are: 1. Falls of coal and roof. 2. Movement of cars in the mines. 3. Explosions of blasts.

The percentage of accidents from these causes may be generally stated as follows: Falls of coal and roof, 45 to 50 per cent. of all accidents underground due to any cause; accidents due to the movement of cars in mines, 15 to 18 per cent.; accidents due to explosions of blasts in mines, 10 to 12 per cent.

In order to reduce the number of accidents due to falls of coal and roof, every working-place should be inspected at least twice a day while the men are at work. An assistant foreman should be placed in charge of each district of the mine and should see that every working-place is properly secured by props or timber and all loose coal or rock pulled down or made secure. Allow no one to work in a place that is unsafe unless for the purpose of making it secure, as required in General Rule No. 12 of the anthracite mine law. The mine foreman or his assistant should see that every miner has a sufficient number of good cap-pieces of suitable length, width and thickness, as well as timbers of the required size for use in his place. He should see that the miner remains at work in his place with his laborer whenever danger is suspected and always in pillar work. The mine foreman and each of his assistants should enter a daily report signed with ink in a book kept for that purpose, and the mine foreman should read the daily reports of each of his assistants.

In order to reduce the number of accidents due to the movement of mine cars, all gangways and main haulage roads should have a clear space of 2½ ft. between the top rail of the car and the ribs or timbers. This clearance should be maintained throughout the entry on the same side of the road as far as practicable and kept free from obstructions of any kind. Where such clearance cannot be provided, refuge holes should be made in the ribs. These should be of ample size and, as far as practicable, on the same side of the roadway not more than 100 ft. apart and whitewashed and kept free from all obstructions. A similar clearance of not less than 2 ft. should be maintained on roads, in all breasts and kept free from obstructions, such as frequently block the roads in rooms, as timbers, rails, tools, etc. The height of gangways and traveling ways should not be less than 5 ft. 6 in. in the clear. No person under the age of 17 shall be employed as triprunner or driver, and no person except the driver shall ride on the front end of a car, where a seat should be provided if required for safety. No person shall ride between the cars and no driver shall stand on the tailchain when driving. Where persons are lowered or hoisted in slopes, special cars should be provided for that purpose. Platforms if used should not extend over the top rail of cars, and chutes must not extend more than 12 in. over the top rail, except when the chutes are at least 16 in. above the rail. All platforms and chutes extending over the top rail of the cars must be removed when a breast is finished or abandoned.

In order to reduce the number of accidents by blasts, wherever practicable, an electric battery should be provided for firing the blast. Such batteries must be approved by the mine foreman, who shall give the miners all needed instructions for their use. Only one kind of explosive shall be used in the same hole, and all holes shall be tamped to the mouth with clay or other incombustible material. No charge of high explosive that has misfired shall be withdrawn, nor shall any attempt be made to open the hole.

Ques.—What air is traveling through a gangway 12 ft. wide and 7½ ft. high when the anemometer registers 472 ft. per min.?

Ans.—The sectional area of this airway is 12 × 7½ = 90 sq.ft. Without making any allowance for the inertia of the anemometer, the volume of air passing in this gangway is 90 × 472 = 42,480 cu.ft. per min.

Ques.—An airway is 5 ft. wide at the top, 10 ft. wide at the bottom and 6 ft. high. If the anemometer reads 280 ft., what is the quantity of air passing?

Ans.—The average width of this airway is ½ (5 + 10) = 7.5 ft., and its sectional area is 6 × 7½ = 45 sq.ft. The volume of air in circulation in the airway is therefore 280 × 45 = 12,600 cu.ft. per min.

Ques.—How would you proceed to remove a body of firedamp from the face of a chamber 40 ft. wide, in a vein 2 ft. high?

Ans.—Assuming that this chamber is filled with an accumulation of firedamp or a mixture of marsh gas and air in explosive proportions and that the vein is pitching, the first step is to notify and remove all the men working on the return air in this section of the mine. It may be even advisable to withdraw all the men from the mine before attempting the removal of the gas. The method of procedure will depend upon the condition of the chamber, but in any case the intake air must be conducted into the chamber and made to sweep the face of the breast. This can be done by erecting a temporary canvas brattice, starting from the mouth of the chamber on the intake side. The brattice should be extended up the pitch gradually, so as to give time for the complete removal of the gas as the work proceeds. Only safety lamps should be used, and these must be protected against a possible fall of roof that would cause an outrush of gas from the chamber. In so thin a vein, it may be better to employ a small "booster" fan and a collapsible canvas air tube for conducting the air to the face of the chamber, assuming these are available. It is important to employ an air current sufficiently strong for the removal of the gas.

Coal and Coke News

Harrisburg, Penn.

A résumé of the work of the Legislature, which adjourned on May 20, insofar as the coal interests of the state are concerned, shows that the mining industry occupied a prominent position during most of the session.

The most important bill affecting the anthracite region was the Catlin bill to bring the anthracite miners under the operation of the workmen's compensation act. This bill was reported from the conference committee on May 20, the only change being made by this committee, was to make it effective Jan. 1, 1916. The Governor has stated that he will sign this measure.

The bill next in importance to the anthracite region is the Dawson tonnage tax measure. This differs from the Roney bill of two years ago in that the money is to be apportioned among the particular municipalities in which the coal is mined, rather than among all the counties, boroughs and townships in the anthracite counties regardless of whether or not they have mineral resources. The governor made a desperate effort to take the major portion of the tax for the use of the state, but the bill finally passed on a 50-50 basis. The measure levies a tax of 2½ per cent. ad valorem on all anthracite coal mined, and provides that one per cent. of the tax shall be paid to the superintendent of the mine for making the return. The Governor was much pleased with the passage of this measure.

A bill passed meaning much to the anthracite miners was the Beidleman measure to create 21 assistant mine inspectors. Anyone working inside of any anthracite mine will be eligible for election; the duties of this office will be to look after the ventilation. Each assistant inspector will receive a salary of $2000 per annum. The Governor now has this measure on his desk.

The Powell bill providing for four new anthracite inspectors is also in the Governor's hands. Three are to be elected in Luzerne and one in Lackawanna County.

The bill to increase the pay of the mine inspectors' examining boards in the anthracite region from $6 to $10 per day is in the Governor's hands.

The joint resolution introduced by Senator Vare to appoint a commission to investigate the increase in prices of anthracite alleged to be in excess of the anthracite tax passed both houses, but the amount appropriated to cover the expense of this commission was cut from $10,000 to $5000.

The Senate bill amending section 1 of article 4, section 1 of article 5 and section 9 of article 24 of the act of June 9 1911, permitting operators, managers and superintendents free selection of mine foremen, assistant mine foremen and fire bosses and placing mine employees under the supervision and control of the operators so as to bring all bituminous workmen under the Compensation Act has passed both houses and the Governor has assured the mine workers that he will sign this measure.

A bill of great importance to mine inspectors of the bituminous region providing that mine inspectors who have served for 8 years and have passed two examinations shall be exempt from any further examinations, needs only the Governor's signature to become a law.

The Crow bill amending rule 18 has already become a statute.

The McClure bill providing that where clay mines are worked with bituminous coal mines they shall come under the supervision of the bituminous mine inspectors has passed both houses.

The veto of the Horton bill regarding safety devices for trips in slope mines is said to be a disappointment to several operators who have been using a system of broken switches. These operators have been required, in addition to their system of derails, to use the customary sprag in the rear car of the trip. Under this system the man in control of the trip closes the switches when the empties are being lowered into the mine. They are opened for a loaded trip, the theory being that should the rope break, the trip would be derailed upon reaching the first switch. Many operators, it is said, hoped through the Horton bill to be relieved from the necessity of using any other safety device.

Two big constructive measures enacted into law were the Child Labor and the Workmen's Compensation acts. The Governor did not stop with giving the child workers between 14 and 16 years of age a 9-hr. day and a 51-hr. week with 8 hr. of that time for school, but had incorporated in the general appropriation bill an appropriation of $1,000,000 for vocational schools.

The opposition to the Workmen's Compensation bill was not so bitter as that toward child labor, but the Governor succeeded in winning his points, in that the act will go into force Jan. 1, 1916, and not in July, 1916, as was intended by the enemies of the bill, who seemed to let up in their fight during the last days of the session. The six bills are in practically the same shape as drawn by the Attorney General, with the exception of a few minor changes, as to appointive power being placed with the Governor and not with the Commissioner of Labor. There are also a few slight changes in the Insurance bill.

A number of bills, among them being the appropriation of $200,000 to the U. S. Bureau of Mines for the coöperation of that bureau with the Department of Mines in the establishment of an experiment station; the appointing of two assistant chiefs in the Department of Mines; the right of committees of mine workers to inspect bituminous coal mines; filing of maps with adjoining property owners of bituminous coal mines; providing for a new state board of examiners of anthracite mine inspectors; and giving power to sealers of weights and measures to examine and seal scales at coal mines, all passed the House, but never saw the light of day when they reached the Senate. All other mining bills were killed in Committee.

It was apparent that a desperate effort was being made to put through a bill which provided that all portable electric lamps used in bituminous mines should be tested by the U. S. Bureau of Mines, one being introduced in the House and another in the Senate, but each time there was such a strong protest against this that they were sent to the scrap heap.

PENNSYLVANIA

Anthracite

Shamokin—Five hundred employees of the Luke Fidler colliery of the Susquehanna Coal Co. were rendered idle on May 19, when the United Mine Workers threw down their tools, declaring they would not work with men who refused to become members of the United Mine Workers of America. Between 25 and 30 miners were without cards entitling them to work as union employees.

The colliery of the Buck Ridge Coal Mining Co. will be closed down for three months. The reasons for this suspension are certain repairs are to be made to the colliery and the present dull condition of the anthracite business, particularly for red ash anthracite coal. It is contemplated that no shipments will be made from the colliery during the above-mentioned period, but this will be governed somewhat by the conditions of the coal market. In the meanwhile, however, work will be done at the colliery for the development of other veins of coal on this property. A recent report made by one of the most prominent anthracite engineers places the recoverable coal still in the ground at Buck Ridge at an amount exceeding 15 million tons.

Ashley—The large planes of the Central R.R. of New Jersey were temporarily shut down recently because one of the big hoisting engines broke down. Ten locomotives and crews from Mauch Chunk are assisting in getting the coal over the planes to the weigh station on the top of the mountain.

Plymouth—Refused the concession of working 8¾ hr. for a 9-hr. day the driver and breaker boys at Buttonwood No. 23 colliery operated by the Lehigh & Wilkes-Barre Coal Co. went out on strike on May 21 tying up collieries Nos. 21 and 23, employing about 1000 men. This was the fifth strike within a week at this company's collieries. The strikers wanted the 15 minutes off each day in order that they might be prepared to leave the mine and breaker the minute nine hours were up.

Hazleton—The Lattimer No. 4 breaker of Pardee Brothers & Co., Inc., one of the largest and best equipped in the Lehigh coal field, was destroyed by fire of unknown origin May 25. The loss is $75,000, partially covered by insurance. Five hundred hands are thrown out of work.

Harrisburg—There is a prospect that the final decision in the anthracite coal tax appeals will not be rendered for two and a half years. The appeals taken by the 100 or more coal companies interested from the settlements made by the Auditor General under the act of 1913, and involving $6,000,000 or more now in the hands of the companies, are now before the State Supreme Court sitting here at the Capitol. However, a petition will be presented asking that the case go over for argument at the October term of the court at Pittsburgh.

Wilkes-Barre—Declaring that if coal is being mined at the rate for which reductions have been made in the value of coal lands during the last three years the supply will be exhausted within 12 years, the school board of Foster township has demanded from the County Commissioners a fair and equitable valuation, so that when the coal supply is exhausted the coal companies will have paid their fair share of the tax burden. The valuation of coal lands in Foster township has been decreased $253,661 this year.

Scranton—Good Roads Day received a big boost when orders were issued by the Lackawanna and Scranton Coal companies closing down all of their collieries May 26 so that their employees might have a day to devote to the good roads movement. The Lackawanna company's action means that 22,000 men in Luzerne and Lackawanna Counties will be at liberty to handle a pick and shovel on the roads, while the Scranton Coal Co.'s 8000 employees will also find work on the roads.

Bituminous

Uniontown—Receivers of Josiah V. Thompson on May 24 closed a deal with the executors of the estate of W. J. Rainey, deceased, for the sale of 76 acres of coal land in Fayette County. The price given out is $2000 per acre. The tract is known as the Johnson farm and adjoins the Revere plant of the Raineys. This is the first sale of coal in Fayette County of any importance in years.

Activity still continues to make itself felt in this section. The Frick company has ordered more ovens to be fired. Some of these were put in at Grindstone while others are distributed among the different works. Grindstone is at present operating 245 ovens out of a total of 300. Orders from Scottdale are looked for almost daily that will cause the plant to resume in full.

Ferndale—Eight men were killed in an explosion late on Monday afternoon (May 24) in the Valley No. 1 mine of the Smokeless Coal Co. and another lost his life in attempting their rescue, the latter being Gomer Phillips, chief of the first-aid work of the mining department of the Cambria Steel Co. After he entered the mine at the head of the rescue corps of his company, Phillips, it is thought, became confused and pulled off his helmet. He was overcome by the gases and died at the hospital several hours later.

The dead were not taken from the mine for many hours after the explosion. They were all Americans. The mine did not work on Monday, but the men were allowed to enter to load cars, it is said, in order that they might earn a little extra money.

News of the accident was at once telephoned to the Cambria Steel Co. at Johnstown, and a mine rescue corps was immediately rushed to the Valley mine. The rescue team was equipped with oxygen helmets and other apparatus. The rescuers penetrated the workings some distance in spite of the fallen roof and broken timbers and partitions, but found no sign of life. Some of the bodies of the men who had been at work at the time of the explosion were located, but were not removed for some time, for the efforts of the rescuers had to be directed chiefly to saving their own comrades who were overcome.

Superintendent C. H. Crocker of the Cambria company was one of the victims. He was brought to the surface by General Manager H. J. Meehan of the steel company who volunteered to enter the mine without a helmet. Gomer Phillips, John Broderick, John Frear and W. M. Dyer, members of the Cambria crew, were all overcome and taken to the hospital. All were resuscitated with the exception of Phillips.

It is believed that the explosion was due to gas, which accumulated in the right heading of slope No. 2 of Valley No. 1 mine. This slope is located about 2000 ft. from the main entrance.

All must have died almost instantly, as the bodies first encountered showed, but little evidence of the victims having struggled to make their way toward safety. For a time there was no certainty as to the number of victims, it being believed that some of the men at work might have made their way out by an entry leading into another working of the same company.

Greensburg—Complaint has been made by the Pittsburgh & Ohio Coal Mining Co., and the Jamison Coal & Coke Co., with the Interstate Commerce Commission against the Baltimore & Ohio R.R. Co. It is charged by the complainants that the charge of $1 for demurrage on cars at Cleveland, Lorain and Sandusky, during April and October, is unjust and unfair. The statement is made that lake travel is often held up those two months and it is impossible for that reason for cars to be loaded on lake steamers promptly.

Bentleyville—Seven hundred safety lamps were destroyed in the recent fire at the lamp house of the Acme Mine No. 2 of the Westmoreland Coal Co. The damage amounted to about $2000.

Pittsburgh—Heavy shipments of coal and other freight are being made by water from Pittsburgh to lower river points. A total of 160,550 tons of freight left the harbor on May 23, among which were some heavy shipments of steel products.

The miners of the Pittsburgh district are at last enjoying a period of some prosperity. According to recent estimates, about 37,000 coal miners are now employed in this district. While all of these are not working full time, they are at least all making a living. It is anticipated that coal shipments will shortly be made to practically capacity. Should coal operations become much heavier a shortage of men will be experienced.

WEST VIRGINIA

Martinsburg—The last payday at the various mines near Lonaconing was the largest for a long time. It is reported that the Consolidation Coal Co. alone distributed upward of $87,000. This is said to have been the largest pay, save one, that this company has distributed under its present management.

Welch—E. T. Wolfe, night foreman of the Carter Coal Co., at Coalwood, was recently fined $52 and costs for alleged violation of section No. 13 of the mining law. The charge was that the mine fan had been shut down from 5 p.m. to 7:45 p.m., and that Wolfe had sent men into the shaft before he examined the mine. Also that he failed to have a signal at the head of the shaft, according to the mining law.

Charleston—There has been a perceptible increase in the coal business in this section of the state recently. Many of the mines along the route of the Kanawha & Michigan R.R., between Charleston and Gauley Bridge, on both the north and south sides of the Kanawha River, have increased their tonnage to meet the demands of consumers, and it is expected that conditions will continue to improve throughout the summer. The mines at Boomer, Longacre, Carbondale, and other places, are now working full time, and have taken back all their old employees who were laid off last fall.

ALABAMA

Birmingham—There will be a Field Day demonstration held at Birmingham under the auspices of the Alabama Safety Association on May 29, and 78 first-aid teams have entered for the event. Three silver loving cups are to be presented respectively to the best team of white men, the best team of white women, and the best team of colored men. The American Mine Safety Association will meet in Birmingham in October. First aid teams from all parts of the country will attend that meeting also.

In the case of the Tennessee Coal & Iron Co. vs. C. B. Smith, state auditor, the Supreme Court has handed down a decision whereby the Tennessee company recovers $18,000 from the state which was collected for license fees under the statute which was recently declared unconstitutional.

KENTUCKY

Whitesburg—There is the greatest activity in the mines in the Letcher County field and three to four hundred miners have been put to work in the last week or so. The amount of coal going out of this district at present is the greatest in the history of the field. Full time operations are to be the rule shortly.

Owensboro—The Fern Hills Coal Co.'s property, equipment and tipple have been sold for $16,800 by Master Commissioner Clements to T. A. Pedley, receiver. The property included 600 acres of land, with all the coal and mineral rights and the total had been appraised at $25,000. Indiana coal dealers were opposing bidders.

Henderson—The Deep Water Coal & Coke Co. will close the big deal for thousands of acres of western Kentucky coal lands in July, according to a statement attributed to H. F. Allen, president of the company. It had been reported previously that the war in Europe was delaying consummation of the deal.

Lothair—The Ashless Coal Corporation has increased its coal shipments from 2000 to 3000 tons daily since the improvement of the markets of the Great Lake region. A good increase has also been made in the working force.

Benham—The Wisconsin Steel Co. is now shipping more coal than at any time in the history of the plant. It also proposes some increases during the summer months. Three hundred extra miners have gone to work during the past 10 days.

OHIO

Cincinnati—The contract for the sale of the Marmet Coal Co.'s properties to an Eastern syndicate has been presented to the superior court and approved. The approval of the court was made subject to a part payment of 20 per cent. of the purchase price of $1,500,000, failing which public sale of the property will be had. It is reported that the syndicate intends the Marmet properties as a nucleus for large operations, from which coal for the Northwestern markets will be taken. The company's bonds to the amount of $563,500 are to be sold June 8, 1915, by Irwin, Ballmann & Co., of Cincinnati, being covered by a mortgage on all of the company's property, which is presumably to be conveyed to the purchasing syndicate subject to this incumbrance.

INDIANA

Terre Haute—The coal mining properties of the J. K. Dering Coal Co., of Chicago, situated in Sullivan, Vigo, and Vermillion Counties were recently sold at auction to the Continental Commercial Bank of Chicago, for $400,000, following a decree of foreclosure on petition of the bondholders.

Sullivan—The heirs of John L. Woodbridge have filed suit against the Vandalia Coal Co., demanding $20,000 royalty. They allege that their father's farm was leased in 1898 to the Island Valley Coal Co. for 25 years the lessee or his assigns to pay 5c. for each ton that would pass a 1½-in. screen. The Island Valley Co. sold its lease in 1905 to the defendant company which, it is alleged, has mined 400,000 tons of coal on which it has paid no royalty.

ILLINOIS

Pana—Mine No. 1 of the Pana Coal Co. was recently sold by Special Master in Chancery Jas. L. Drennan to Leslie L. Taylor, of Taylorville, at public auction for $30,000. The sale includes all mineral rights amounting to more than 1000 acres of underlying coal, all machinery, together with several tracts of city property.

Belleville—Damage suits aggregating $33,000 have been instituted in the Circuit Court against the Franklin Coal & Coke Co., as the result of the mine accident at Royalton, Ill., Oct. 27, 1914, in which 29 miners lost their lives.

Cuba—Star Mine No. 3 recently hoisted 866 tons of coal in one day, which is the best record ever made at this mine.

IOWA

Albia—A coal deal was recently closed, by which the Smoky Hollow Coal Co. has come into possession of No. 7 Hiteman Mine, which was started a few years ago. This is said to be one of the best mines in Cedar Township.

FOREIGN NEWS

Vancouver, B. C.—Internment of alien enemies on a wholesale scale was begun May 25 in the coal mining district of Vancouver Island. By noon 115 Austrians and Germans in the Southfield, Cumberland and Nanaimo mines had been placed on a special train bound for the internment camps. The alien enemies were taken into the mines a year ago as strikebreakers when the coal pits were tied up by the Western Federation strike. The former workmen are now to resume their jobs.

PERSONALS

John R. Hoffman, oldest mining engineer of the Philadelphia & Reading Coal & Iron Co., has retired because of age.

James Reese has been made general superintendent of the mining operations of the Maderia Hill Coal Mining Co., in the Mahanoy Valley.

C. N. Blanchard, of Binghamton, N. Y., head of Blanchard & Co., which owns the anthracite mine at Archbald, Penn., has retired from the company and will give his whole time to the Seiler-Blanchard Co., of which he is treasurer.

J. S. Roughgarden, for some time Buffalo representative of Whitney & Kemmerer, has resigned. His successor is F. W. Buckalew, who has been traveling salesman from the Buffalo office of the firm.

Edwin Maurer, formerly superintendent of the Lehigh Coal & Navigation Co.'s shops, at Lansford, Penn., was the victim of an accident recently when he was struck by a bicycle, and thrown to the ground. Although seriously injured, Mr. Maurer is expected to recover.

Lloyd G. McCrum, formerly of the McCrum-Howell Co., has just been made general manager of mines for W. H. Bradford & Co. Inc., of Somerset, Penn. Offices have been opened in New York, Philadelphia and Somerset. The plants of the new corporation are all located near Somerset, Penn.

Reese Tasker, general mining superintendent of the Philadelphia & Reading Coal & Iron Co., suffered a stroke of paralysis recently and his condition continues to be critical. Mr. Tasker has been prominent in mining affairs for nearly half a century and has been one of the leading officials of the Reading coal company for 25 years.

Philip N. Case, sales engineer for the Hyatt Roller Bearing Co., will in the future be in charge of all mine car applications, traveling in the western part of Pennsylvania, Ohio and West Virginia. Mr. Gleisen who formerly covered this territory will travel in the eastern part of Pennsylvania, New York and New Jersey.

Thomas I. Scott and G. H. Hodges, superintendents respectively of the Wynn and Kyle plants of the H. C. Frick Coke Co., have been transferred to the engineering department at the Scottdale offices of the company of which both men are graduates. For the present P. J. Locke of the Leith plant will have supervision over Crossland works; Superintendent English, of Oliphant, will have charge of the Wynn plant, and Superintendent Beerbower, of York Run, will look after the Kyle plant.

INDUSTRIAL NEWS

Williamson, W. Va.—The Williamson Coal Co. is advertising for coal miners.

New York, N. Y.—The Bulah Coal Mining Co. is now occupying its new offices in the Equitable Bldg. at 120 Broadway, New York.

Bluefield, W. Va.—The shipments of coal over the Norfolk & Western Ry. for the month of April 1915 amounted to 1,683,958 tons; of this the Pocahontas District furnished 1,069,684 tons; Tug River 285,243 tons; Thacker 216,955 and Kenova District 112,076 tons. The coke tonnage for the month was 61,075 tons.

Huntington, W. Va.—The City Employment Bureau recently received a letter asking for 500 men for work in the Consolidation Coal Co. mines in the vicinity of Jenkins, Ky. A number of men have already been sent to this field, but the majority of those applying for work at the Municipal agencies want jobs within the city.

Uniontown, Penn.—Judge Ruppel of Somerset County has handed down an opinion dismissing the suit brought against Archibald Miller, superintendent of the Loyalhanna Coal & Coke Co. operating at Cairnbrook, by Fish Warden Raymond O. McIntosh, of Johnstown, in which the defendant was charged with polluting the waters of Dark Shade Creek with sulphurous mine drainage.

Somerset, Penn.—The mining interests of W. H. Bradford, the Phœnix Fuel Co. and the Victor Coal Mining Co. have consolidated their operating and selling departments under the corporate name of W. H. Bradford & Co. The mines are located in Somerset County, with operating headquarters in Somerset. The main offices of the company will be in the Commercial Trust Building, Philadelphia.

Huntington, W. Va.—It is reported that the Pocahontas Fuel Co. is now building a fleet of colliers which will be entered in the coastwise and foreign trade, principally that with South America. The Clinchfield Collier Co. is also said to be making plans for the construction of two steel colliers which will be put in the foreign trade immediately on completion. The construction of these fleets will mean much to West Virginia in that they will be the means of transporting fuel to a market which hitherto has been touched by few of the coal interests of this state.

Coal Trade Reviews

General Review

Anthracite reported on demurrage and a dull season is anticipated. Heavy export demand for bituminous stimulates interest among local consumers. Lake movement increasing.

The rigid restriction of output at the anthracite collieries has failed as yet to relieve the pressure on the market. The Lake movement is the only branch on anything approaching a normal basis and it is becoming steadily more evident that the trade is in for an abnormally dull season. There are already reports coming in of coal on demurrage going at sacrifice prices.

The constantly expanding export business continues the leading feature in an otherwise dull bituminous market. The activity in this branch is stimulating some interest among buyers in this country and has already resulted in some relatively small contracts being closed, while requisitions on other contracts are slightly heavier due probably to a disposition to accumulate some stocks. On the other hand the market is undoubtedly slow responding to the reported improvement in general industrial conditions. The failure of the West and Northwest to figure more prominently in the spring business is a particularly discouraging feature of the situation. Some of the higher grade fuels which have been diverted entirely into the export business, have recently appeared again in the local markets.

The settlement of the Ohio labor difficulties is viewed with much concern in the Pittsburgh district where competition with outside districts has already brought the market to a more or less complete standstill. The buying is so slow that shrewd consumers have no trouble in filling their current requirements with cheap coal threatened with demurrage. Even the abnormally low circular figure on Lake coal is being substantially shaded. Requisitions from Canada continue at a low ebb while railroad buying is less than a few months ago, and it is generally evident that the reported improvement in industrial conditions has failed entirely to spread to the coal industry.

There has been considerable buying of a temporary character in various directions including fuel for threshing purposes, which is once more a factor in trade circles for a short period at least. Contracting continues slow because of the cheap coal being offered, and concessions on last year's figures are still obtainable. While the Lake movement is still considerably below normal, there is quite a volume of coal moving in that direction, which is creating a somewhat better feeling in trade circles.

The collapse of the selling organization which was attempting to maintain prices in the St. Louis district was a discouraging development in the Middle West during the week. The market is generadlly flat in all directions, with the exception of screenings, the entire output of which is being absorbed on contracts and none is available in the prompt market. Some uncertainties are developing regarding the labor situation in the Middle West.

BUSINESS OPINIONS

Money still accumulating but business is marking time pending receipt of the German note. Steel industry improving in certain branches.

Boston News Bureau—So far as the financial side of the situation is concerned it is purely a waiting proposition, waiting for the German answer to the American note. Our foreign commerce continues surprisingly large, that is our exports, which means, of course, that an enormous trade balance is running in our favor. Money still accumulates and is bound to increase in volume so long as Europe increases our supplies rather than decreases them. The security market is quiet and naturally sensitive. It is good belief, however, that prices would advance more sensationally if the German reply were even fairly satisfactory than they would decline in case the reply was distinctly disappointing.

Iron and Steel—Contracts for rolling stock by the railroads and foreign governments are the chief feature of interest. More orders for cars have been placed in May than in the entire period between Jan. 1 and Apr. 30, and it looks as though there will be a great deal of business in this line. Moreover, railways have been buying fabricated steel for bridges, and the amount of steel required in car building is probably 5% of the capacity of the steel mills. The pig-iron market has been dull. Some sales of 10,000-ton lots have been made to the pipe founders on the Delaware River, but in general very little iron has moved. The jobbing foundries have purchased a little more freely, particularly those in the Connecticut Valley, probably because there is a demand for machinery castings.

Dun's—The uncertainty regarding the European situation, and the broadening scope of the war, have occasioned some hesitation in general business. The effect of this, however, while adding to the underlying conservatism, has not materially changed the recent trend toward normal conditions in the principal industries and trades. The improvement has held its own, and as the special advices received this week from ninety leading cities clearly show, there is a slow but steady expansion in business.

Bradstreet's—While trade and industrial conditions continue to move along generally favorable lines, the week's developments disclose some irregularity. On the one hand, wet or cool weather has checked distributive trade, and especially retail business, and at the same time unsettled international political matters tend to cause wholesale buyers in some lines to go slow, while the same factor holds up certain speculative projects. But, on the other hand, industry is more active, employment is increasing, and war orders continue to cause extraordinary speed at a number of centers.

Marshall Field & Co.—Current shipments of dry goods total about the same as during the corresponding week a year ago. Sales by our traveling organization show an increase over those of the same week last year. The volume of business that is being booked for fall delivery continues to show a gain. Collections are very satisfactory.

ATLANTIC SEABOARD

More talk of firmer prices due to activity in export market. A few additional contracts closed in New England territory. Georges Creek again available for spot delivery. Pennsylvania grades unchanged. Anthracite coming forward slowly and May orders likely to carry over into June.

Bituminous—A few small contracts closed this week have lent color to the increasing talk of firmer prices. The export business is conceded to be in such good shape that some of the buyers, who hitherto have consistently postponed making season purchases, have now already closed, and others are considering doing so in the near future. As a result $2.80 is nearer the figure f.o.b. Hampton Roads than the $2.65 of a month ago, but at the same time there has been no impetus to the trade. It is only because of extremely dull local conditions that the relatively unimportant contracts placed early in the week have been noticed at all. They are significant, however, as showing the trend of the market.

Delivered prices show no material stiffening. At the distributing points there are fewer cargoes being forced on the trade, but the price range depends mainly on the pressure to sell on the part of the various shippers. Some cargoes have waited an undue season and demurrage charges must be heavy.

Georges Creek is beginning to come to Philadelphia and New York, now that foreign tonnage is being cleared more promptly from the Baltimore terminals. This grade has been practically out of the market for spot shipment a month or more, long enough to create a temporary demand for small lots. There will probably be some movement now from Philadelphia in the next 30 days or so.

In the Pennsylvania grades the market continues heavy. Prices reached a low point some weeks ago and there has been no change worth noting. The quality grades are heard from all over the market, but there will hardly be any improvement in demand until Pocahontas and New River are well established on the $2.85 basis.

Water Freights are unchanged. The supply of barge and steamer tonnage is ample for coastwise needs. Sailing vessels continue to charter off-shore as fast as they become available.

Anthracite—Shipments are being made rather more slowly this month than was anticipated. Apparently the curtailment at the mines is having effect and with the companies who do most of the business in this territory there is prospect now that orders will drag over into June. Less is heard here of prices under the circular. Some of the individual shippers are behind on their orders.

Current quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.85@1.40	$1.20@1.60	$1.67@1.77	
Philadelphia*	2.10@2.65	2.45@2.85	2.92@3.02

Providence†	....	....	....	3.55@3.73

* F.o.b. †On cars.

NEW YORK

Bituminous market continues flat though agencies are still optimistic. Curtailment at anthracite collieries fails to help the market and New York Harbor is choked with coal. Some low prices being quoted.

Bituminous—While there has been no tangible change in the demand for bituminous coal the market has strengthened and the prospects for a still better situation are encouraging. The improvement is principally due to increased orders from regular customers who apparently wish to take advantage of the present situation to enlarge their stock piles. The possibility of many Italians employed in the mines returning to their native country has become something of a factor in the situation.

The export business is constantly increasing. New inquiries are being received regularly, a recent one coming from Italy for about 200,000 tons. A shortage of cars is reported along the Baltimore & Ohio and the Chesapeake & Ohio roads but no serious trouble is anticipated.

Local shippers are encouraged by the increased demand and the resultant slight advance in general quotations. While stray cargoes have been picked up at slightly lower prices the lowest average quotation noted is $2.35 f.o.b.

Quotations on the various grades are as follows:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek	$3.00@3.10	$3.00@3.10	$3.00@3.10	$1.45@1.55

Steam		2.45@2.50	2.45@2.50	0.90@0.95
Western Maryland		2.35@2.45	2.35@2.45	0.80@0.90

Anthracite—The hard-coal market is dull. The effects of the suspension of mining inaugurated by some of the companies has not as yet become apparent and New York harbor is choked with coal. There is plenty of all sizes to go around with much to spare. Prospects for a better market are not encouraging until the fall, unless it be in a further suspension of operations.

Shippers have had trouble with the demurrage problem. While much of it has had to do with loaded cars there has been considerable coal loaded in bottoms which has to be disposed of quickly to save extra charges; to get rid of this coal on advantageous terms has been a hard problem and some good grades have gone at what might be called extremely low prices.

Of the prepared coals, stove is in best demand; along the line the demand for this size is better than in the Metropolitan district. Nut and egg are heavy with the individuals selling at less than the April circular. The steam sizes show no improvement. Good grades of pea coal have suffered the heaviest cutting according to reports. There is no market for the buckwheat grades, some shippers being willing to take whatever they can get for them, within reason.

Quotations are as follows:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$4.65		$4.70	
Egg	4.90	$4.80	4.95	$4.85
Stove	4.90	4.80	4.95	4.85
Chestnut	5.15	5.00	5.20	5.05
Pea	3.35@3.50	3.10@3.35	3.40@3.55	3.15@3.40
Buckwheat	2.50@2.75	2.25@2.50	2.55@2.80	2.30@2.55
Rice	2.00@2.25	1.90@2.10	2.05@2.30	2.00@2.25
Barley	1.75@2.00	1.60@1.75	1.80@2.05	1.85@2.10

PHILADELPHIA

Lack of tone in anthracite. Volume of business decreasing, although domestic sizes are well taken up on the curtailed mining. There is no indication of any change in bituminous.

Anthracite—The past month has been in marked contrast with the corresponding period of a year ago. At that time, the demand persisted well into June, but now curtailment has been found necessary even as early as the middle of the current month. The companies are handicapped for facilities to store their surplus sizes. The market is more than absorbing the production of broken, egg and stove on curtailed mining, and doubtless could do more than this, if the other sizes could be disposed of. Chestnut at this season of the year, usually finds a ready outlet in the Lake business, but it is understood that the large stocks carried over at the head of the Lakes have resulted in light orders. The movement of buckwheat and rice is good under the curtailed mining; chestnut and pea seem to be the most difficult to dispose of, with the latter quoted at anywhere from $1.65 to $2 at the mines.

Prices at Tidewater are about as follows:

	Circular	Individuals
Broken	$4.35	$4.35
Egg	4.60	4.60
Stove	4.60	4.60
Chestnut	4.85	4.60@4.70

Bituminous—Prices are uniform, although still at a low level. Considerable coal is moving on contract, and spot business is improving, but the indications for better conditions in the near future are not bright.

OCEAN CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Julia Park	British	Baltimore[1]	River Plate	1868	$8.16
Adriatic	British	Baltimore[1]	Italy[2]	1921	10.80

BALTIMORE

Anthracite conditions poor and betterment comes but slowly to the bituminous trade. Failure of the Northwest to figure in the spring trade is felt. Export business holds good.

Hard-coal agencies are far from satisfied with conditions. Many consumers are showing a disposition to withhold all save emergency orders. The result has been a dull period in offices of anthracite shippers.

In bituminous there is but slow response to the much talked of betterment of industrial conditions. Prices remain steady as compared with the previous week. As contracts are closed that make the market for best grade coals a little more restricted, there is a growing tendency to hold those fuels a little tighter, but ordinary and medium grades are still offering freely at low figures. Failure of the West, and Northwest more particularly, to figure heavily in the early spring trade is being felt. West Virginia gas coals, especially, have failed of their usual spring rise.

Export business continues good. Last week the foreign movement ran close to 47,000 tons, and there is no longer any doubt but that the total for May will run considerably over the 200,000-ton mark, the first time that such a tonnage has ever been shipped from this port. Italy and the Argentine still absorb the best part of the foreign movement. Most of the coal going from this port to Italy is for street railway and electric lighting plant use which only a successful invasion of Italy could well halt.

Charters for the past week included the following:

Vessel	Nationality	To	Rate
Monkshaven	British	River Plate	$9.54
Evaline	British	River Plate	9.60
Fert	Italian	West Coast of Italy	....
Camilla	Norwegian	Port Limon	....
Egyptian Transport	British	Tiburon	....
Enrico Parodi	Italian	West Coast of Italy	10.80
Dewa	British	West Coast of Italy	10.80
Ocland	Norwegian	Daiquiri	.....
Alf	Danish	Havana	..
Iolannis P. Goulandris	Italian	West Coast of Italy	10.80
Panughi Lykiardopoulus	Greek	River Plate	9.36
Balto	Norwegian	Gothenburg, Sweden	...
Isle of Jura	British	Alexandria, Egypt	11.00
Gledhow	British	River Plate	9.60

HAMPTON ROADS

Export shipments still large. Government takes coal for west coast. No change in prices. Coal going in storage at Sewalls Point.

Dumpings over the piers at tidewater have made a good showing during the week although the coastwise shipments are perhaps not so heavy as anticipated. The export movement from Hampton Roads is still large, especially to the Italian market which has taken over 60,000 tons during the week. The movement to the Canal Zone and Brazilian ports has shown up well and while a number of the cargoes to Brazil have been handled by schooners one large cargo of 6000 tons went by steamer to Santos. The largest cargo of the week, however, went to the Canal Zone by the new collier "Ulysses." This vessel took 12,021 of cargo and 979 tons of bunker coal.

The export movement is all Pocahontas or New River mine-run. The New England coastwise shipments have consisted of high volatile mine-run, smokeless and also prepared coals and nut and slack, and have moved to Boston, Calais, Me., Providence, Portland, New Bedford, and Everett. Bunker vessels coaling during the week have taken in some cases as much as 1800 tons and over, due probably to scarcity of coal in European ports.

There has been practically no change in prices at tidewater. The accumulation of coal on the railway yards is still somewhat in excess of normal with a fair quantity moving from the mines. There is, however, a heavy amount of vessel tonnage due which should cut well into the accumulation. Coal is now being dumped into the storage plant at Sewalls Point and it is expected this will be continued during the summer or at least until the demand is such that coal cannot be gotten forward from the mines fast enough to supply vessel tonnage as it arrives.

Coal shipments from Hampton Roads week of May 14 to 21 were:

Norfolk			Norfolk

[1] Week ending Friday. [2] Nine days.

OCEAN FREIGHTS

South American charters easier. Activity in negotiations for Spanish and Italian tonnage.

The export coal trade is growing daily and numerous steamers have been chartered for this business since our last report.

South America—These rates are softer and steamers can now be secured at concessions under last fixtures.

Mediterranean—A number of steamers were chartered since our last report at $10.80 to west coast of Italy, and it is too early to state what effect the entrance of Italy into the war will have upon freight rates to this destination. Seven or eight steamers were recently chartered to take coal to Spanish ports, some for four voyages at $9.60 and others for single voyages at $10.20. We daily have boats offered us at $9.60 for single voyages and at $9.24 for four voyages to Spanish ports, other terms being 500 tons per day discharge at 1 peseta, Spanish dues for account of cargo.

Cuba and West Indies—A few steamers were chartered for these destinations during the past week, and rates are unchanged.

To	Rate	To	Rate

**Spanish dues for account.
W. W. Battie & Co.'s Coal Trade Freight Report.

LAKE MARKETS

PITTSBURGH

Pittsburgh market adversely affected by Ohio settlement. Prices not quotably changed, however. Mining at 50 to 60% of capacity.

The Pittsburgh district coal trade, already in poor shape, cannot expect to be improved by the settlement of the labor troubles of so long standing on the other side of the state line. It has frequently been stated in Pittsburgh coal circles that the troubles of the Pittsburgh district's coal market have arisen, not so much from competition within, as from competition without. It has been difficult for the Pittsburgh district to meet the other districts in competitive markets, and the consumptive area directly tributary to Pittsburgh is naturally far from sufficient to operate the mines even at one-half capacity, particularly when the steel industry and its customers are operating at only about 70% capacity.

Pittsburgh coal prices are not quotably changed, except that slack, with the growth of the Lake season, has softened a trifle further. Prices on free coal are about as follows: Slack, 55@65c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1@1.05; ¾-in., $1.10@1.15; 1¼-in., $1.20@1.25, per net ton at mine, Pittsburgh district. On Lake coal the usual asking price is $1.15 and while this is an extremely low price compared with other seasons, it has been shaded occasionally. On contracts with regular consumers to run to Mar. 30 the usual asking price is $1.15 on mine-run, but this can also be shaded. The mines are operating at 50 to 60% of capacity.

BUFFALO

Improvement in trade hardly perceptable though some shippers report better conditions. Anthracite continues as dull as ever.

Bituminous—The consumer is very slow about buying. There is no stocking up and sellers have to depend on a temporary business. Concessions in prices are necessary to get rid of lagging shipments and consumers now refuse to buy at all except at reduced prices. The railroads are not buying as much coal as three months ago, though stocks of fuel must be getting low.

There is no improvement in the Canadian trade, which was poor before the European war began, and has been growing steadily worse right along. The Canadian view of the situation is that an actual state of war exists and nothing but emergency measures should prevail.

Bituminous prices are still based on $2.70 for Pittsburgh lump, $2.55 for three-quarter, $2.45 for mine-run and $2.25 for slack.
